Heinlein, perhaps frustrated, but clearly determined, decided to reshape the material in *For Us, The Living.* The concept of a future history is often cited as Heinlein's greatest contribution to science fiction and remains the core concept of this novel. By lifting, revising, and expanding the most compelling ideas from *For Us, The Living* and turning them into stories, Heinlein found a way to break the dry spell with Campbell. Once he became dominant in the pulps, he was able to stretch the boundaries farther and farther with each tale.

Heinlein always found a way to open up science fiction to wider possibilities. After the war, he was the first science fiction pulp writer to break into the "slicks" of the mainstream. He was the first science fiction writer since H. G. Wells to write a screenplay for a Hollywood movie, the first American film to realistically depict a moon shot: *Destination Moon.* He was the first science fiction writer to begin a series of juveniles that would educate entire generations of readers to love science fiction and outer space. His later novels continually challenged the very definition of science fiction, provoking anger and debate—and, as always, a legion of imitators.

Throughout his career, Heinlein mentored other writers, particularly those just starting out. One of his five rules for writing compiled in "On the Writing of Speculative Fiction" stated, "You must keep it on the market until sold." Not having everything published gnawed at him, and as he once wrote to science fiction editor and writer Frederik Pohl in 1940, the stories "sit here and shame me." The six rejected stories were submitted elsewhere until finally sold—although a story-hungry Campbell actually bought one that he had initially turned down, "Elsewhen."

So why has *For Us, The Living* never been published . . . until now?

Shortly before Heinlein's death, as he and his beloved wife, Virginia, were preparing for his final days, their copies of this unpublished manuscript were destroyed.

By now, having read the novel, longtime fans may have noticed that some of Heinlein's earliest stories (and a few of his later ones) were mined from *For Us, The Living.* In a way, much of this novel has indeed been published, as "If This Goes On—," "The Roads Must Roll," "Coventry," and *Beyond This Horizon,* the most obvious extractions. Perhaps Heinlein thought there was no point in publishing a novel that had already been stripped and resold ...but his fans know better. His entire Future History, published primarily in *The Past Through Tomorrow,* uses recurring characters and themes, and the later novels are often a constant blending from previous works. No, there must be another reason.

Robert Heinlein often spoke disparagingly of his writing, rejecting the idea that his work was anything more than just "stories." That posture was a good defense against both the fans who wanted him to be their guru and the few literary critics who chose to write negatively about him. Heinlein showed in *The Number of the Beast* that he had little love for literary critics—he isolated them in an inescapable room, wherein they might practice their vicious and cannibalistic art on one another until they could escape by actually reading the books they were criticizing. The few books published about Heinlein before his death did not give him much reason for respect, given their persistent factual errors and ax-grinding interpretations. So the Heinleins had few expectations that his work would ever receive acceptance outside of the science fiction readership.

Before her death in January 2003, Virginia "Ginny" Heinlein came to realize that her husband's work is now being treated in contexts wider than science fiction. Scholars are beginning to recognize the connections between Heinlein's writing and that of Voltaire, Ralph Waldo Emerson, Mark Twain, Jerome K. Jerome, Rudyard Kipling, and James Branch Cabell, among others. She began to realize that the shroud of privacy surrounding their lives could finally be lifted, in order to help the literary reappraisal now taking hold. She authorized and collaborated on a full biography of Robert Heinlein, which is being written by William Patterson, the editor of the *Heinlein Journal.* She aided many other researchers, including Philip Owenby and Marie Ormes for their doctoral dissertations and me in my own research into the life of Leslyn Heinlein. Ginny helped found and support *The Heinlein Society,* a nonprofit group dedicated to furthering her husband's goals, including education, blood drives, space exploration, and eventually, publishing a scholarly edition of the Heinlein canon (you can join this noble cause at www.heinleinsociety.org).

In short, Ginny decided her husband's work and life should be treated openly and fully.

However, Ginny died before she knew that a single copy of *For Us, The Living* had survived. On Thanksgiving Day, 2002, weakened by a difficult recovery from pneumonia earlier that year, she broke her hip. She seemed to be recovering from her surgery and was to be released the week that I received a copy of *For Us, The Living* in the mail. I was looking forward to discussing my discovery with her when she suddenly passed away in January 2003.

Major writers often leave behind unpublished works. Heinlein himself had two unpublished nonfiction books released posthumously: *How to Be a Politician* (published as *Take Back Your Government!)* and *Tramp Royale.* Hemingway has had no fewer than four major books published after his death. Heinlein's favorite writer, Mark Twain, had several books published after his death, including the masterpiece *The Mysterious Stranger.* Literary scholars treat these works in their proper context, as pieces of the larger puzzle that comprise the writer's entire output.

As the first step in the fifty-year writing career of Robert Heinlein, *For Us, The Living* is like looking at Neil Armstrong's first footprint on the moon—a footprint Robert Heinlein played no small part in making possible, with his fiction glorifying space travel, and his work on *Destination Moon.*

And that is how I believe Ginny would have come to see it: as the beginning, deserving of preservation.

So how did this manuscript survive?

Shortly before his death, Robert Heinlein decided he wanted his biography to be written. Dr. Leon Stover, an expert on H. G. Wells, had written a book on Heinlein that, by and large, Heinlein liked. After his death, Ginny informed Dr. Stover that he was to be the authorized biographer. Dr. Stover immediately began contacting Heinlein's surviving friends with the estate's full approval. One of those friends was the highly decorated Admiral Caleb Laning, Heinlein's best friend at the Naval Academy and his coauthor on two post-World War II nonfiction essays. Cal Laning had kept fifty years' of correspondence with Heinlein intact, and he handed this treasure trove over to Dr. Stover for use in the authorized biography.

But Dr. Stover and Ginny Heinlein soon had a falling out, and she revoked his permission to write the biography.

For the next decade, nothing further happened.

Through my research and contacts with those who knew Leslyn Heinlein, I found myself in possession of a partial manuscript of Dr. Stover's unpublished biography. In the few pages I had, Dr. Stover mentioned his possession of the manuscript of *For Us,The Living,* apparently given to him by Cal Laning.

Attempts to contact Dr. Stover failed, but I had the name of his student assistant, Michael Hunter. Hunter was quite surprised that I had found him, but forthright in discussing his work with Dr. Stover. When Hunter was a senior, Dr. Stover had asked him to read the novel, make a synopsis for use in the biography, and use it in a student project connecting Heinlein's first novel to both H. G. Wells and to Heinlein's later writings. Hunter never did anything with his copy of the manuscript, under the assumption that Dr. Stover's biography would soon be published and Heinlein's first novel revealed to the world. Life went on, and he never heard from Dr. Stover again.

Hunter simply forgot he had a copy of *For Us, The Living.*

At my request, he went digging through his garage and found it, buried in boxes from his college years. He willingly sent me a copy.

After Ginny's unexpected death, I passed the manuscript on to the estate, which decided the novel was well worth publishing.

And now, Robert Heinlein's first and final achievement is in your hands.

"You must keep it on the market until sold." A clean sweep at last.

Robert James, Ph.D. Culver City, California July 2003

ROBERT ANSON HEINLEIN

July 7, 1907-May 8, 1988

Robert Heinlein was born in Butler, Missouri, the third of seven children. He spent the majority of his youth in Kansas City, taking jobs at a young age to supplement his family's income. It was apparent early on that Heinlein was a child prodigy of the sort that sometimes appears in his fiction. He learned chess at the age of four and took an early and abiding interest in astronomy, reading voraciously on the subject and giving lectures as a young student. His 1924 high school yearbook photo caption read, "He thinks in terms of the Fifth dimension, never stopping at the Fourth."

After high school, Heinlein applied to Annapolis—submitting one hundred letters of recommendation to his state senator—and graduated in 1929, twentieth in his class, with the rank of ensign. He was married shortly after graduation, though little is known of that union, which ended after approximately one year. In 1932 he married Leslyn MacDonald, an intelligent and politically radical woman who inspired many of his female characters.

Later that year, while serving aboard the destroyer *Roper,* Heinlein contracted pulmonary tuberculosis and was hospitalized. By 1934, his continual bouts with the disease rendered him disabled and forced his retirement from the military. He went on to study mathematics and physics at the graduate school of the University of California, though recurring illness forced his early withdrawal, and he campaigned unsuccessfully for a district assembly seat in Hollywood.

In 1939, after a failed naval career and a humbling defeat in his political endeavors, Heinlein turned to writing as a way to earn a living. This third career choice proved lucrative. By the early 1940s, he had paid off a large mortgage and was by all accounts a successful writer, having won the respect and admiration of the science fiction community. His first novel, *Rocket Ship Galileo,* was published by Scribner in 1947, and over the next twelve years, he wrote one book a year for Scribner, creating a highly respected and award-winning series of juveniles. During that time, Heinlein also wrote and published short stories, adult novels, and the script for *Destination Moon,* widely considered to be the first science fiction film. The movie was nominated for three Academy Awards and won in the category of Special Effects. During this time he was also divorced from Leslyn and married Virginia "Ginny" Gerstenfeld, a friend and colleague from his Navy days.

The Heinleins spent their marriage traveling, writing, entertaining, and working on behalf of many charitable causes—particularly blood drives, a tradition which is carried on by the Heinlein Society. In 1956 Heinlein won his first Hugo Award, for *Double Star,* and went on to win an unprecedented four Hugos, three Retro Hugos, and in 1975 received the first Grand Master Nebula Award for lifetime achievement from the Science Fiction Writers of America. He earned wide acclaim for novels such as *Stranger in a Strange Land, Starship Troopers, The Moon Is a Harsh Mistress,* and *The Puppet Masters.* Robert Heinlein continued writing, participating in political debate, and championing the cause of space travel well into the 1980's, when he retired to Carmel, California, with Ginny. His last novel, *To Sail Beyond the Sunset,* was published in 1987, one year before his death.

VARIABLE STAR with Spider Robinson

For the women without whom
none of this would have been necessary:
Bam, Evelyn, Ginny, Jeanne, Amy, Terri Luanna, Ruth, Kate, and Eleanor

Editor's Preface

In Robert A. Heinlein's *Stranger in a Strange Land* there is a story about a Martian artist so focused on his work that he fails to notice his own death, and completes the piece anyway. To Martians, who don't go anywhere when they die but simply become Old Ones, the burning question was: should this work be judged by the standards used for art by the living, or for art by the dead?

A similar situation occurs here for one of the first times on this planet. This book is a posthumous collaboration, begun when one of its collaborators was seven, and completed when the other was seventeen-years-dead. Spider Robinson discusses this at length in his Afterword, but a brief explanation at the start may help readers to better appreciate what they're reading, and to decide by what standards they should evaluate it. After the passing of Robert Heinlein's widow, Virginia, in 2003, his archivist/biographer discovered a detailed outline and notes for a novel the Grand Master had plotted in 1955, but had never gotten around to writing, tentatively titled *The Stars Are a Clock.* Heinlein's estate executor and literary agent decided the book deserved to be written and read, and agreed that Spider Robinson was the only logical choice to complete it.

First called "the new Robert Heinlein" by the *New York Times Book Review* in 1982, Robinson has been linked with him in the reviews of most of his own thirty-two award-winning books. The two were close friends. Spider penned a famous essay demolishing his mentor's detractors called "Rah, Rah, R.A.H.!," and contributed the introduction to Heinlein's recently-discovered 1939 first book, *For Us, the Living.*

It was a pairing as fortuitous as McCartney and Lennon. You are about to read something genuinely unique and quite special: a classic novel fifty years in the making, conceived in the Golden Age of SF by its first Grand Master, and completed in the Age of Cyberspace by one of his greatest students. *Variable Star* is Robert A. Heinlein's only collaborative novel—and we believe he would be as proud of it as Spider Robinson is, and as we at Tor are to publish it.

—Cordwainer LoBrutto, Senior Editor

One

For it was in the golden prime
Of good Harun Alrashid ...

—Alfred, Lord Tennyson, *Recollections of the Arabian Nights*

I thought I wanted to get married in the worst way. Then that's pretty much what I was offered, so I ended up going trillions of kilometers out of my way instead. A great many trillions of kilometers, and quite a few years—which turns out to be much the greater distance.

It began this way:

Jinny Hamilton and I were dancing.

This was something of an accomplishment for me, in and of itself—I was born on Ganymede, and I had only been Earthside a few years, then. If you've never experienced three times the gravity you consider normal, imagine doing your favorite dance . . . with somebody your own weight sitting on each of your shoulders, on a pedestal a few meters above concrete. Broken bones, torn ligaments, and concussions are hazards you simply learn to accept.

But some people play water polo, voluntarily. Jinny and I had been going out together for most of a year, and dancing was one of her favorite recreations, so by now I had not only made myself learn how to dance, I'd actually become halfway decent at it. Enough to dimly understand how someone with muscles of steel and infinite wind might consider it fun, anyway.

But that night was something else.

Part of it was the setting, I guess. Your prom is *supposed* to be a magical time. It was still quite early in the evening, but the Hotel Vancouver ballroom was appropriately decorated and lit, and the band was excellent, especially the singer. Jinny was both the most beautiful and the most interesting person I had ever met. She and I were both finally done with Fermi Junior College, in Surrey, British Columbia. Class of 2286 (Restored Gregorian), huzzah—go, Leptons! In the fall we'd be going off to university together at Stony Brook, on the opposite coast of North America—if my scholarship came through, anyway—and in the meantime we were young, healthy, and hetero. The song being played was one I liked a lot, an ancient old ballad called "On the Road to the Stars," that always brought a lump to my throat because it was one of my father's favorites.

It's the reason we came from the mud, don't you know
'cause we wanted to climb to the stars,

In our flesh and our bone and our blood we all know
we were meant to return to the stars,

Ask anyone which way is God, and you know *he will probably point to the stars ...*

None of that explained the way Jinny danced that night. I knew her as a good dancer, but that night it was almost as if she were possessed by the ghost of Gillis. It wasn't even just her own dancing, though that was inspired. She did some moves that startled me, phrases so impressive she started to draw attention even on a crowded dance floor. Couples around us kept dancing, but began watching her. Her long red hair swirled through the room like the cape of an inspired toreador, and for a while I could only follow like a mesmerized bull. But then her eyes met mine, and flashed, and the next thing I knew I was attempting a combination I had never even thought of before; one that I knew as I began, was way beyond my abilities—and I nailed it. She sent me a grin that felt like it started a sunburn. and offered me an intriguing move, and I thought of something to do with it, and she lobbed it back with a twist, and we got through five fairly complex phrases without a train wreck and out the of her side as smoothly as if we'd been rehearsing for weeks. Some people had stopped dancing to watch, now.

On the way to the stars
every molecule in you was born in the heart of a star.
On the way to the stars—
in the dead of the night they're the light that'll show
where you are
yes they are
from so far ...

In the back of my head were a few half-formed, half-baked layman's ideas for dance steps that I wasn't even sure were physically possible in a one-gee field. I'd never had the nerve to actually try any of them with a partner, in any gravity; I really hate looking ridiculous. But Jinny lifted an eyebrow—*what have you got?*—and before I knew it I was trying one, even though there was no way she could know what her response was supposed to be. Only she did, somehow, and made it—or rather, an improved variation of what I'd thought of—and not only was the result successful enough to draw applause, by luck it happened to offer a perfect lead-in to another of my ideas, which also turned out to work, and suggested something to her—

We flew.

We'll be through if the day ever comes when we no
longer yearn to return to the stars.

I can't prove it's so, but I'm certain: I know
that our ancestors came from the stars.

It would not be so lonely to die if I knew
I had died on the way to the stars.

Talking about dance is as silly as dancing about architecture. I don't know how to convey exactly how we danced that night, or what was so remarkable about it. I can barely manage to believe we did it. Just let it stand that we deserved the applause we received when the music finally ended and we went into our closing clinch. It was probably the first time since I'd come to Terra that I didn't feel heavy and weak and fragile. I felt strong . . . graceful . . . manly . . .

"After dancing like that, Stinky, a couple really ought to get married," Jinny said about two hundred millimeters below my ear.

I felt fourteen. "Damn it, Jinny—" I said, and pulled away from her. I reached down for her hands, trying to make it into a dance move, but she eluded me. Instead she curtsied, blew me a kiss, turned on her heel, and left at high speed, to spirited applause.

It increased when I ran after her.

Jinny was 178 centimeters tall, not especially tall for a Terran, and I was a Ganymedean beanpole two full meters high, so her legs were considerably shorter than mine. But they were also adapted from birth to a one-gee field—to *sports* in a one-gee field. I didn't catch up with her until we'd reached the parking lot, and then only because she decided to let me.

So we'd each had time to work on our lines.

Ginny went with, "Joel Johnston, if you don't want to marry me—"

"Jinny, you know perfectly well I'm going to marry you—"

"In five more frimpin' years! My God, Stinky, I'll be an old, old woman by then—"

"Skinny, you'll *never* be an old woman," I said, and that shut her up for a second. Every so often a good one comes to me like that. Not often enough. "Look, don't be like this. I can't marry you right now. You know I can't."

"I don't know anything of the sort. I know you *won't.* But I see nothing preventing you. You don't even have to worry about parental consent."

"What does that have to do with it? Neither do you. And we wouldn't let parental disapproval stand in our way if we *did* want to get married."

"You see? I was right—you *don't* want to!"

I was becoming alarmed. I had always thought of Jinny as unusually rational, for a girl. Could this be one of those hormonal storms I had read about? I hoped not—all authorities seemed to agree the only thing a man could do in such weather was lash himself to the mast and pray. I made a last stubborn attempt to pour logic on the troubled waters. "Jinny, please—be reasonable! I am not going to let you marry a dole bludger. Not even if he's me."

"But—"

I intend to be a composer. You know that. That means it's going to take me at least a few years to even start to get established. You knew that when we started dating. If, I say 'if,' all those bullocks I sacrificed to Zeus pay off and I actually win a Kallikanzaros Scholarship, it will be my great privilege to spend the next four years living on dishrag soup and scraped fridge, too poor to support a cat. If, and I say 'if,' I am as smart as I think I am, and luckier than I usually am, I'll come out the other end with credentials that might, in only another year or two, leave me in a position to offer you something more than half of a motel cubicle. Meanwhile, you have your own scholarships and your law degree to worry about, so that once my music starts making serious money, nobody will weasel it away from us."

"Stinky, do you think I care about *money?"* She said that last word as if it were a synonym for stale excrement.

I sighed. Definitely a hormonal storm. "Reboot and start over. What is the purpose of getting married?"

"What a romantic question!" She turned away and quested for her car. I didn't move.

"Quit dodging, I'm serious. Why don't we just live together if we want to be romantic? What is marriage for?"

The car told her she was heading the wrong way; she reversed direction and came back past me toward its voice and pulsing beacon. "Babies, obviously"

I followed her. "Bingo. Marriage is for making jolly babies, raising them up into successful predators, and then admiring them until they're old enough to reward you with grandchildren to spoil."

She'd acquired the car by now; she safed and unlocked it. "My baby-making equipment is at its peak right now," she said, and got in the car. "It's going to start declining any minute." She closed, but did not slam, the door.

I got in my side and strapped in. "And the decline will take decades to become significant," I pointed out logically "Your baby-making gear may be at its hypothetical optimum efficiency today—but my baby-*raising* equipment isn't even operational yet."

"So what?"

"Jinny, are you seriously proposing that we raise a child as extraordinary and gifted as ours on *credit?"* We both shared a most uncommon aversion to being in debt. Orphans spend too much of their childhood in debt to others—debt that cannot be repaid.

"Nobody seems to be seriously proposing around here, she said bitterly.

Hormonal hurricane, maybe. A long time ago they used to name all hurricanes after women. On Ganymede, we still named all groundquakes after them. "Look—"

She interrupted, "Silver: my home, no hurry." The car said, "Yes, Jinny," and came alive, preparing for takeoff.

I wondered as always why she'd named her car that—if you were going to pick an element, I thought, why not hydrogen? I failed to notice the slight change in address protocol. Despite our low priority, we didn't have to wait long, since nobody else had left the prom yet and the system was between rush hours; Silver rose nearly at once and entered the system with minimal huhu. That early in the evening, most of the traffic was still in the other direction, into Greater Vancouver. Once our speed steadied, Jinny opaqued the windows, swiveled her seat to face me, and folded her arms. I'm sure it was quite coincidental that this drew my attention to the area immediately above them. I believe in the Tooth Fairy, too. "Pardon me for interrupting you," she said.

She looked awfully good. Her prom dress was more of a spell than a garment. The soft warm interior lighting was very good to her. Of course, it was her car.

That was the hell of it. I wanted to marry her at least as much as she wanted to marry me. Just looking at her made my breath catch in my throat. I wished with all my heart, and not for the first time, that we lived back when unmarried people could live together openly. They said a stable society was impossible, back then. But even if they were right, what's so great about a stable society?

My pop used to say, "Joel, never pass up a chance to shut up." Well, some men learn by listening, some read, some observe and analyze—and some of us just have to pee on the electric fence. "Jinny, you know I'm a backward colonial when it comes to debt."

"And you know I feel the same way about it that you do!"

I blinked. "That's true. We've talked about it. I don't care what anybody says; becoming the indentured servant of something as compassionate and merciful as a bank or credit union simply isn't rational."

"Absolutely."

I spread my hands. "What am I missing? Raising a child takes money—packets and crates of the stuff. I haven't got it. I can't earn it. I won't borrow it. And I'm too chicken to steal it."

She broke eye contact. "Those aren't the only ways to get it," she muttered. Silver gave its vector-change warning *peep,* slowed slightly, and kinked left to follow the Second Narrows Bridge across Burrard Inlet.

"So? I suppose I could go to Vegas and turn a two-credit bit into a megasolar at the roulette wheel."

"Blackjack," she said. "The other games are for suckers."

"My tenants back home on the Rock might strike ice. In the next ten minutes I could get an idea for a faster-than-light star drive that can be demonstrated without capital. I can always stand at stud, but that would kick me up a couple of tax brackets. Nothing else comes to mind."

She said nothing, very loudly. Silver peeped, turned left again, and increased speed, heading for the coast.

"Look, Spice," I said, "you know I don't share contemporary Terran prejudices any more than you do—I don't insist that I be the one to support us. But somebody has to. If you can find a parttime job for either of us that pays well enough to support a family, we'll get married tomorrow."

No response. We both knew the suggestion was rhetorical. Two *full-time* jobs would barely support a growing family in the present economy.

"Come on," I said, "we already had this conversation once. Remember? That night on Luckout Hill?" The official name is Lookout Hill, because it looks out over the ocean, but it's such a romantic spot, many a young man has indeed lucked out there. Not me, unfortunately "We said—"

"I remember what we said!"

Well, then, maybe I didn't. To settle it, I summoned that conversation up in my mind—or at least fast-forwarded through the storyboard version in the master index. And partway through, I began to grow excited. There was indeed one contingency we had discussed that night on Luckout Hill, one that I hadn't really thought of again, since I couldn't really picture Jinny opting for it. I wasn't sure she was suggesting it now . . . but if she wasn't, I would.

"See here, Skinny, you really want to change your name from Hamilton to Johnston right away? Then let's do it tomorrow morning—and ship out on the *Sheffield!"* Her jaw dropped; I pressed on. "If we're going to start our marriage broke, then let's do it somewhere where being broke isn't a handicap, or even a stigma—out there around a new star, on some new world eighty lightyears away, not here on Terra. What do you say? You say you're an old-fashioned girl—will you homestead with me?"

A look passed across her face I'd seen only once before—on Aunt Tula's face, when they told me my father was gone. Sadness unspeakable. "I can't, Joel."

How had I screwed up so badly? "Sure you could—"

"No. I *can't.*" She swiveled away from me.

The sorrow on her face upset me so much, I shut up and began replaying everything since our dance, trying to locate the point at which my orbit had begun to decay. Outside the car, kilometers flicked by unseen. On the third pass, I finally remembered a technique that had worked for me more than once with women in the past: quit analyzing every word I'd said and instead, consider words I had *not* said. Light began to dawn, or at least a milder darkness. I swiveled her seat back to face me, and sought her eyes. They were huge.

I dove right in. "Jinny, listen to me. I *want* to marry you. I ache to marry you. You're the one. Not since that first moment when I caught you looking at me have I ever doubted for an instant that you are my other half, the person I want to spend the rest of my life with. Okay?"

"Oh." Her voice was barely audible.

"You give me what I need, and you need what I can give. I want the whole deal, just like you've told me you want it—old-fashioned death do us part, better or worse monogamy, like my parents. None of this term marriage business, no prenup nonsense, fifty-fifty, mine is thine, down the line, and I don't care if we live to be a hundred. I want to marry you so bad, my teeth hurt. So bad my hair hurts. If you would come with me, I would be happy to walk to Bootes, carrying you on my back, towing a suitcase. My eyeballs keep drying out every time I look at you. Then when you're out of their field of vision, they start to tear up."

Her eyes started to tear up. "Oh, Joel—you *do* want to marry me." Her smile was glorious.

"Of course I do, Skinny you ninny. How could you not know that?"

"So it's just—"

"Just a matter of financing. Nothing else. We'll get married the day we can afford to." I loosened my seat belt, so I'd be ready for the embrace I was sure was coming.

Her smile got even wider. Then it fell apart, and she turned away, but not before I could see she was crying.

What the hell had I said *now?*

Of course, that's the one question you mustn't ask. Bad enough to make a woman cry; to not even know how you managed it is despicable, but no matter how carefully I reviewed the last few sentences I'd spoken, in my opinion they neither said anything nor failed to say anything that constituted a reason to cry.

Silver slowed slightly, signaling that we were crossing the Georgia Strait. We'd be at Jinny's little apartment on Lasqueti Island, soon. I didn't know what to apologize *for.* But then, did I need to? "Jinny, I'm sorry. I really—"

She spoke up at once, cutting me off. "Joel, suppose you knew for sure you had your scholarship in the bag? The whole ride?" She swiveled her seat halfway back around, not quite enough to be facing me, but enough so that I was clearly in her peripheral vision.

I frowned, puzzled by the non sequitur. "What, have you heard something?" As far as I knew, the decisions wouldn't even be made for another few weeks.

"Damn it, Stinky, I'm just saying: Suppose you knew for a fact that you're among this year's Kallikanzaros winners."

"Well . . . that'd be great. Right?"

She turned the rest of the way back around, so that she could glare at me more effectively "I'm asking you: If that happened, how would it affect your marriage plans?"

"Oh." I still didn't see where she was going with this. "Uh, it'd take a lot of the pressure off. We'd know *for sure* that we're going to be able to get married in as little as four years. Well, nothing's for sure, but we'd be a whole lot more . . ."

I trailed off because I could see what I was saying wasn't what she wanted to hear. I had to shift my weight slightly as Silver went into a wide right turn. I didn't have a clue what she did want to hear, and her face wasn't giving me enough clues. Maybe I ought to–

Wide right turn?

I cleared my side window. Sure enough, we were heading north; almost due north, it looked like. But that was wrong: we couldn't be that far south of Lasqueti. "Jinny, I—"

She was sobbing outright, now.

Oh, God. As calmly as I could, I said, "Honey, you're going to have to take manual control: Silver has gone insane."

She waved no-no and kept sobbing.

For a second I nearly panicked, thinking . . . I don't know what I was thinking. "Jinny, what's *wrong?"*

Her weeping intensified "Oh, Jo-ho-ho-ho—"

I unbuckled, leaned in, and held her. "Damn it, talk to me! Whatever it is, we'll fix it, I know we will. Just tell me."

"Oh, God, I-hi-hi'm sorry . . . I screwed it all up-hup-hup-hup . . ." She clutched me back fiercely.

I was alarmed. I'd seen Jinny cry. This was hooting with sorrow, rocking with grief. Something was seriously wrong. "Whatever it is, it's okay, you hear me? Whatever it is."

She writhed in my arms. "Joel, I lie-hi-hi-hi-hied . . . I'm so stu-hoohupid . . ."

Ice formed on the floor of my heart. I did not break our embrace, but I felt an impulse to, and I'm sure she felt it kinesthetically. She cried twice as hard. Well, much harder.

It took her several minutes to get back under control. During those minutes, I didn't breathe or think or move or digest food or do anything at all except wait to learn what my Jinny had lied about. Then, when she took in a deep breath and pulled away from my arms, suddenly I didn't want to know. So I thought of a different question she could answer instead. "Where are we going?"

Her eyes began to slide away from mine, then came back and locked. "To my home."

This time I caught the subtle change. Usually the instruction she gave Silver was "my *place."*

"So? And it's north?"

She nodded.

"How far?"

"Silver: step on it," she said. The car acknowledged. Then to me, as Silver faced our chairs forward and pressed us back into them with acceleration, she said, "About twenty minutes, now."

I consulted a mental map and glanced out the window—with difficulty, as we were now pulling serious gees. Jinny's car was exceedingly well loved, but nonetheless it was just short of an antique. There was simply no way it could go anywhere near this fast. I made myself breathe slowly. This just kept getting better and better.

Twenty minutes north of Lasqueti at this speed would, it seemed to me, put us smack in the middle of a glacier somewhere, just below the border with Yukon Province. I was dressed for a ballroom, didn't have so much as a toothbrush. Not that it mattered, because we were doing at least four times the provincial exurban speed limit; long before we reached that glacier the Mounties (local cops) were going to cut our power and set us down to await the Proctors . . . probably in raw forest. Unless, of course, Silver tore himself apart first, traveling at four times the best speed he'd been capable of the day he left the factory.

Less than half an hour before, I'd been as perfectly happy as I'd ever been in my life, dancing with my Jinny. I opaqued my window, surrendered to the gee forces, and stared straight ahead at nothing. To my intense annoyance, she let me.

Life is going to continue to suck until somebody finds the Undo key.

Two

Howe'er it be, it seems to me
'Tis only noble to be good.

Kind hearts are more than coronets,
And simple faith than Norman blood.
—Alfred, Lord Tennyson,
Lady Clara Vere de Vere

The engine did not explode. It didn't even sound any louder than usual. The Mounties somehow failed to notice us blazing across their radar, or to log any complaints about shattered windows; we crossed the province unmolested. For most of the trip we were above atmosphere, so high that the horizon showed a distinct curve—we pretty much had to be at that speed, I think—but if the Peace Forces satellites noticed us, they kept it to themselves. Nineteen minutes later, the car finished decelerating, came to a dead stop, and went into hover mode, glowing softly from the heat of our passage and reentry into atmosphere.

"Wait," Jinny said—whether to Silver or to me, I was unsure.

I glanced at her, then turned to my side window once again and looked down. Sure enough, what lay some three thousand meters below us was a nearly featureless glacier. There was a big rill to the east, and a shadowy crevasse almost directly below that was much smaller, but still large enough to conceal several dozen cars the size of Silver. I looked hack to Jinny. She was staring straight ahead at the windshield, which was still opaque.

Keeping my mouth shut was easy this time. I not only didn't know how I felt, I didn't even know what I felt it *about.* I couldn't have been more clueless if I'd had my head in a sack. Anything I said was likely to sound stupid in retrospect, and there are few things I hate more.

"I rehearsed this a hundred times," she said finally. "Now I've screwed it up completely"

I suspected this was true, but kept my mouth shut.

She swiveled my way and unbuckled her crash harness, though we were still three klicks above hard ice. It gave her enough freedom of movement to lean forward and take one of my hands in both of hers. I noted absently that the skin of her palm was remarkably hot. "Have you ever heard of Harun al-Rashid?" she asked me.

"Plays defense for the Tachyons?"

"Close," she said. "You're only off by, let me see, a little more than a millennium and a half. Fifteen hundred and some years."

"But he does play defense."

"Stinky, please shut up! He was a rich kid, from a powerful military family in ancient Persia. His father was a Caliph, roughly equivalent to premier of a province today, a man so tough he invaded the Eastern Roman Empire, which was then ruled by the Empress Irene."

"You're making this up," I charged.

Her eyes flashed. "I said 'please,' Joel."

I drew an invisible zipper across my lips.

"Harun became Caliph himself in the year 786." Over a thousand years before man could even travel anywhere. "He was probably as wealthy and powerful as anybody in living memory had ever been. Yet somehow, he was not an ignorant idiot."

"Amazing," I said, trying to be helpful.

Go try to be helpful to a woman who's talking. "He had the odd idea it was important to know what his people were really thinking and feeling about things," she went on as if I had not spoken. "He wanted more than just the sanitized, politically safe version they would give to him or to anyone he could send to talk to them. He understood that his wealth and power distorted just about everything in his relations with others, made it difficult if not impossible for truth to pass between them. You can see how that would be, right?"

"Sure. Everybody lies to the boss."

"Yes!" Finally, I'd gotten one right. "Then one day he overheard one of his generals say that nobody knows a city as well as an enemy spy. It gave him an idea.

"That night he disguised himself as a beggar, sneaked out of his palace alone, and wandered the streets of Baghdad, a spy in his own capital. Everywhere he went, he listened to conversations, and sometimes he asked innocent questions, and because he was thought a beggar, no one bothered to lie to him. He got drunk on it. He started to do it whenever he could sneak away"

Her eyes were locked on mine, now. It was important that I get this.

"Do you see, Joel? For the first time in his life Harun got an accurate picture of what the common people honestly thought . . . more than just what they thought, he experienced firsthand what life was really *like* for them, came to understand the things they didn't even think about because they simply assumed them . . . and their perspective informed and improved his own thinking from then on. He became one of the most beloved rulers in history—his name means Aaron the Just, and how many rulers do you suppose have ever been called that? One time fifteen thousand men followed him into battle against one hundred twenty-five thousand—and whipped them, left forty thousand legionaries dead on the ground and the rest running for their lives. He lived to a ripe old age, and when he died the whole Muslim world mourned. Okay?"

I was nodding. I understood every word she said. I had no idea what she was driving at.

She took a deep breath. "Okay. Now, imagine you're a young

Persian girl in Baghdad. I see your mouth opening, and so help me God, if a wisecrack should come out of it . . . that's better. You're a poor-but-decent young Persian girl, working hard at some menial trade, struggling to better yourself, and so is—"

A strange alto voice suddenly spoke, seemingly from the empty space between Jinny and me, just a little too loudly. I was so startled I nearly jumped out of my seat. "Your vehicle's hull temperature has dropped sufficiently to permit safe debarking now, Miss Jinny."

If I was startled, Jinny was furious. I could tell because her face became utterly smooth, and her voice became softer in pitch and tone and slower in speed as she said, "There are only four letters in the word 'wait,' Smithers. There seems little room for ambiguity"

"I'm sorry, Miss Jinny," Smithers said at once, and although there was no noticable cessation of any background hiss or power hum, somehow he was *gone*.

"And so," she went on before I could ask who Smithers was, "is your boyfriend . . . call him Jelal. The two of you are very much in love, and want to get married, but you just don't have the means. And then one day—"

"Wait ," I said, "I think I see where this is going . . . sort of. One day the beggar who lives next door comes over, right, and it turns out he's incredibly rich and he says he's been eavesdropping and he understands our problem and he offers Jelal a—"

I stopped talking. The penny had just dropped. All of sudden, I actually did see where this was going, at least in general terms. "Oh . . . my ... *God . . ."* I breathed. "I've got it just backward, don't I?"

Her eyes told me I was right. "There wasn't any other way, do you see? Once I met you as Jinny Hamilton, I *couldn't* tell you. And anyway, the whole point was to—"

"You're Harun al-Rashid!"

"Well, his granddaughter," she said miserably.

I was stunned. "You're rich."

She nodded sadly. "Very."

Tumblers began to click into place. I tried to think it through. "You're not even an orphan, are you?"

Headshake. "I couldn't let anyone at Fermi meet my parents. They're . . . pretty well known. Hiring a pair of Potemkin parents for social purposes seemed grotesque."

"And you came to Fermi, instead of Lawrence Campbell or one of the other top prep schools, so you could—what? See how the other half lives?"

"Well . . . in part."

I was ranging back through my memories, adding things up with the benefit of hindsight, understanding little things that had puzzled me. Silver's previously unsuspected power. Jinny's extraordinary confidence and poise, so unexpected in an orphan. How, whenever someone brought up one of the really fabulous vacation destinations—Tuva, or the Ice Caves of Queen Maud Land in the Antarctic, or Harriman City on Luna—Jinny always seemed to have seen a good documentary about it recently. The way, when we ate pistachios, she always threw away the ones that were any trouble at all to open—

I became aware that Jinny was absolutely still and silent, studying my face intently for clues to what 1 was thinking. It seemed like a good idea; maybe I should get a mirror and try it. I thought about banging my head against the dashboard to reboot my brain.

Instead I looked at her and spread my hands. "I'm going to need some time to process this," I admitted.

"Of course," she said at once. "Sleep on it. There's no hurry. Tomorrow I'll introduce you to my real father. And meantime I'll answer any questions you have—no more evasions, no more white lies."

I didn't feel as though I knew enough to formulate a coherent question yet. No, wait, I did have one—purely for form's sake; I didn't see how the answer could help me. Still—

"What is it *really?"*

She blinked. "Crave pardon?"

"You said, 'Once I met you as Jinny Hamilton . . .' So that's not your real name. Okay, I'll bite. What is?"

"Oh, dear," she said.

"Jinny Oh.' Chinese, dear?"

Not amused. "Joel—"

"Come on, how bad could it be? Look, let's meet for the first time all over again. Hi there, I'm Joel Johnston, of Ganymede. And you are—?"

She stared at me, blank-faced, for so long I actually began to wonder whether she was going to tell me. I couldn't recall ever seeing her hesitate about anything before, much less this long. One of the many things I liked about her was that she always knew what she wanted to be doing next. Finally she closed her eyes, took in a long breath, released it . . . squared her shoulders and opened her eyes and looked me right in the eye.

"I'm very pleased to meet you, Mr. Johnston. I'm Jinny Conrad."

For a second or two nothing happened. Then my eyebrows and my pulse both rose sharply. It couldn't be. "Not—"

"Of Conrad," she confirmed.

It *couldn't* be.

"It's true," she said. "W father is Albert Conrad. Richard Conrad's third son."

"You're Jinnia Conrad of Conrad," I said.

She nodded once.

I didn't quite faint—but it was good that I was sitting down, and strapped in. My head drained like a sink; all the blood and most of the brain matter dropped at once to my feet.

Very rich, she'd said. Yeah, and the Milky Way is rather roomy!

The Conrad industrial/informational empire was larger than the Rothschild family, the Hanseatic League, Kinetic Sciences Interplanetary, and Rolls-Daiwoo combined, and only slightly smaller than the Solar System. Nothing like it could have existed before the advent of space travel—and perhaps it became inevitable in the first minute of Year One, as Leslie LeCroix was still shutting down the *Pioneer's* engine on the virgin surface of Luna. The Conrads were a 150-year dynasty, every member of whom wielded wealth, power, and influence comparable to that of the Hudson's Bay Company or Harriman Enterprises in their day. Their combined interests ranged from the scientific outpost on Mercury, to Oort Cloud harvest—to interstellar exploration as far as sixtyfive lightyears away. At that time there were well over a dozen starships either outgoing or incoming, and eight had already returned safely (out of a hoped-for eighteen), five of them bearing the riches of Croesus in one form or another. Three of those big winners had been Conrad ships.

She gave me a minute—well, some indeterminate period. Finally she said, "Look, I have to land, now. Smithers wasn't completely out of line to remind me. We . . . don't like to hover, here. It's just a bit conspicuous."

"Okay," I said, to be saying something. "Where's here?"

"In a minute. Silver: I relieve you."

"Yes, Jinny." She took the stick and we dropped three thousand meters rapidly enough to give me heart palpitations.

Which nearly became cardiac arrest when the ground came rushing up, and she failed to decelerate hard enough to stop in time! We were going to crash—

—right through the imaginary glacier—

—and into a deep valley, its floor lush and green and inviting and, best of all, still hundreds of meters below us. She landed us, without a bump, in a small clearing that from the air had looked indistinguishable from dozens of others, to me at least. But the moment she shut down, hoses and cables sprouted from the forest floor and began nurturing Silver. Ahead of us was a huge boulder, the size of a truck; as I watched, a large doorway appeared in it, facing us.

"We're here," she said.

"I ask again: Where is here?"

She shook her head. "It isn't."

"Isn't what?"

"Isn't anywhere."

I turned my head just enough to be looking at her out of the corner of my eye. "Here isn't anywhere."

"Right."

I closed my eyes. If I had just stayed back home on the farm, by now I might have been making enough of a crop to afford a hired man. That would have freed me up to do some courting—in a frontier society with considerably looser rules about premarital experimentation than contemporary Terra.

But I knew for a fact there was no one remotely like Jinny anywhere on Ganymede. *Had* known it for a fact, that is, even *before* learning that she was more well off than the Secretary General. . . .

No, I couldn't take that in just yet. "I really really wish I could think of something more intelligent to say than, 'What do you mean, "here isn't anywhere"?' "

She shrugged. "You tell me. If a place does not appear on any map, anywhere . . . if it doesn't show in even the finest-grain satellite photos . . . if no wires or roads or paths run to it, no government takes mail to it or taxes from it, and nobody is from there . . . in what sense does it exist? There is no here. Just us."

"Here."

"Exactly"

I nodded and dismissed the matter. "And this is your home?"

"One of them."

I nodded. "And your apartment on Lasqueti, of course. It must be weird having two homes."

She didn't say a word or move a muscle.

I turned to look at her. "More than two?"

Silence. Stillness.

"How many homes do you have, Jinny?"

In a very small voice, she said, "Eight. *Not* counting the Lasqueti place."

"So?"

"But three of them are offplanet!"

"Naturally," I agreed. "One winters in space."

"Oh, Joel, don't be that way."

"Okay. Let's go in."

She looked distressed. "Uh ... if you are going to be that way, maybe it might he better to do it out here, before we go in."

I nodded again. Mr. Agreeable. "Sure. That makes sense. Okay." Then, big: *"How could you do this to me, Jinny?"*

She didn't flinch or cringe or duck. "Think it through, Joel. Sleep on it. Tomorrow morning, you tell me: How could I have *not* done it?"

I began an angry retort, and swallowed it. I had to admit I had not begun to think this thing through yet, and Dad always drilled into me that the time to open your mouth came *after* that. Besides, I already had a glimmering of what she meant. I filled my lungs, emptied them slowly and fully, and said, "You're right. Okay I'm prepared to be polite, now. Let's go inside."

"You won't have to be," she said. "I promise you won't see any family at all until tomorrow morning. I made them guarantee that. This is our Prom Night."

I frowned. "I wish I had an overnight bag. Change of socks, fresh shirt, my razor—"

"Don't worry about it," she said, and unlocked the doors.

I let it go. Probably the contents of the slop chest here were finer than anything I owned. "All right. Invite me up to your place."

"Down, actually."

We opened our doors and got out. The roof of imaginary glacier did not exist from its underside; the moon and stars shone unimpeded overhead, a neat trick. But this was definitely not a natural ecology. The air was skin temperature, with an occasional breeze just slightly warmer. It smelled of dirt and green growing things, with just a little ozone tingle as if it had rained recently, though it had not. The loamy earth beneath my feet was rich, almost quivering with life; any farmer I knew back on Ganymede would have desperately envied it. Acres of it, at least a meter deep: wild, uncultivated, supporting nothing but trees, scrub, and inedible berries. Just *lying* there. Conspicuous nonconsumption. *Start getting used to it, old son.* I thought of saying something, but I knew Jinny would never understand. It's funny: the very *word* "Terra" means "dirt"—and not one hungry terrestrial in a thousand has a clue how important, how precious it is. I shook my head.

The door in that huge rock ahead of the car was indeed an elevator. Back when I was four I'd been in an elevator that nice. In Stockholm, when Dad came Earthside to pick up the Nobel. Like that one, this elevator had a live human operator, of advanced age and singular ugliness, who made it a point of pride to remain unaware of our existence: he happened to be leaving as we stepped in, and took us down a good fifty meters with him. The car descended with unhurried elegance. It gave me time to think about the kind of people who would live deep underground, in a place that did not exist . . . and still feel the need to pull the sky over them like a blanket. "Paranoid" didn't seem to cover it.

By happy chance the operator decided to pause and check the operation of the doors just as he was passing the floor we wanted; so intent was his inspection, we were able to escape unnoticed. This left us in a kind of reception room, so lavish as to remind me of the lobby of that hotel back in Stockholm. The carpet was grass. But I didn't get time to study the room; nearly at once I felt a tugging and turned to see a man older and uglier than the elevator operator trying to take my cloak. With some misgivings I let him have it, and that seemed to have been a mistake, for he simply handed it off to a small boy who suddenly appeared in my peripheral vision, and then literally threw himself at my feet and began loosening my shoes. I . . . reacted. If we'd been under normal gravity, on Ganymede or Mars, I think I'd have kicked his teeth in; as it was he went sprawling. But he took a shoe with him as he went, a trick I admired as much as I resented it. Jinny giggled. I recovered, removed the other shoe myself with as much dignity as I could muster, and handed it to him as he approached again. He reunited it with its twin, bowed deeply, and backed away.

I turned to Jinny and forgot whatever I'd been about to say. Her own cloak and shoes had been magicked away by tall elves, and she looked . . . how do girls do that, anyway? One minute just be there, and the next, *be there.* They can do it without moving a muscle, somehow.

"Good evening, Miss Jinny," said a baritone voice from across the room. "Welcome home."

Standing just inside a door I had failed to notice was a man nearly as tall as me with a shaved head, wearing a suit that cost more than my tuition at Fermi Junior. Like us, and the various elves I'd seen, he wore no shoes. Presumably they would cobble us all new ones in the night.

"Thank you, Smithers. This is—damn. Excuse me." She lifted her phone-finger to her ear, listened for a few moments, frowned, said "Yes," and broke the connection. "I've got to go, for just a few minutes. Get Joel situated, would you please, Smithers? I'm sorry, Joel—I'll be back as soon as I can."

"Okay."

She was gone.

Somehow he was at my side, without having covered the intervening distance. "Good evening, Mr. Johnston. I'm Alex Rennick, master of the house at present. Welcome to the North Keep. Let me show you to your room, first, and then perhaps I can give you the ten-credit tour."

His eyes were gray, almost mauve. His head wasn't shaved, it was depilated. Despite his height, a dozen subconscious cues told me he was earthborn. He was fit, and had an air of great competence and great confidence. I'm pretty good at guessing ages, given that everybody looks alike now, and I couldn't pin him down any closer than the thirty-to-sixty zone. I found it interesting that he knew my last name without having been given it.

"Thank you, Mr. Rennick. You are most kind. Please call me Joel."

"And I am Alex. Will you come this way, Joel?"

I thought of an ancient joke, put it out of my mind, and followed him from the room. As I did I promised myself, solemnly, that no matter what wonders I was shown here, I would not boggle. No matter how staggeringly opulent the place proved to be, I would not let it make me feel inferior. My father had been a Nobel laureate, and my mother a great composer—how many of these people could say as much?

"Do you have any questions to start?" he asked as we went.

"Yes, Alex," I said, memorizing the route we were taking. "Why does Jinny call you Smithers?"

"I have no idea." His tone was absolutely neutral, but somehow I knew I'd touched a sore spot. Either it bothered him not to know—or the answer was humiliating.

"Ah," I said, lowering my pitch. "To drive you crazy, then." I was curious to see how he'd respond to an invitation to a jocular, between-us-men discussion of his mistress—whom I personally knew to be a handful and a half.

He sidestepped effortlessly. "That would be redundant, I'm afraid."

"Have you worked here long?"

"Yes."

I see. "How many people live here in . . . the North Keep, you said?"

"The number varies."

His stinginess with information was beginning to mildly irritate me. "No doubt. But surely as master of the house you know its current value." I halfway expected him to say "Yes, I do," and clam up. But he wasn't that kind of childish. Instead he used jujitsu. "There are eighty-four persons resident in the North Keep at the moment. By midnight the number will be ninety-two, and shortly before breakfast time tomorrow it is expected to drop back to eighty-nine."

"Ah." I hesitated in phrasing my next question. "And how many of those are employees?"

"All but four. Five tomorrow." Yipes! Yes, Conrads lived here, all right. "Here we are." He stopped before a door that looked no different from any of several dozen we'd passed along the way, and tapped the button which on Terra is for some reason always called a knob.

The door dilated to reveal a room full of thick pink smoke. At least it looked like smoke, and behaved like it, roiling and billowing—with the single exception that it declined to spill out of the open door into the corridor. I reminded myself I'd promised myself not to boggle, and with only what I hoped was an imperceptible hesitation, I walked right into the pink smoke, came out the other side—

—and boggled. Worse; I actually yelped.

I was on Ganymede.

Look, I admit I'm a hick. But I *had* experienced Sim walls, by that point in my life, even if I couldn't afford them yet. Even good ones didn't really fool you; you could tell they were not-real, just rectangular windows into worlds that you never really forgot were virtual. I'd even experienced six-wall Sim, 360-degree surround, and even then you had to voluntarily cooperate with the illusion for it to work: it never *quite* got the rounding correction perfect at the corners. But it was pretty good.

This was *real.* I was back home on Ganymede—so convincingly that for just a startled moment, two-thirds of my weight seemed to leave me. I realized with astonishment that the air even *smelled* like Ganymede air, tasted like it, different from terrestrial air in ways subtle but unmistakable. I was standing in the middle of a newly made field, the soil only just coming to life. Beneath my feet, earthworms were shaking off the grogginess of cold sleep and beginning to realize they weren't on Terra anymore. On the edge of the field, fifteen or twenty meters away, was a new-built farmhouse, smoke spiraling from its chimney. Try and build a fire anywhere else on Terra and they'd fine you the equivalent of two months' tuition—for a first offense. Until today, I hadn't seen a square meter of naked soil since I'd landed on its namesake. I felt my eyes begin to sting and water, and with no further warning a tidal wave of homesickness broke over me.

I spun around in time to see Rennick come through the doorway. From this side too it looked like it was full of pink smoke. But it was no longer a door in anything: it just stood by itself in the middle of the field, a rectangle of pink smoke without any wall to be a hole in. I turned my back on hole and house master alike.

"Miss Jinny thought you'd find this congenial," he said from just behind me.

I nodded.

"Follow me please."

That didn't require an answer either. We walked to the farmhouse and went inside. "The 'fresher and entertainment center are in the obvious places. You'll find clothing in that closet, Unlimited Access at that desk. If you want anything—anything whatsoever—state your wishes to the house server. His name is Leo."

I had the homesickness under control now, enough that I trusted myself to speak at least. "Leo is listening at all times?"

"Leo listens at all times," he agreed. "But he cannot *hear* anything unless he is addressed. Your privacy and security as a guest are unconditionally guaranteed."

"Of course," I said as if I believed him. I idly opened the closet he'd indicated, and found all my own clothing. Boggle.

On closer inspection it proved to be *copies* of nearly every piece of clothing I owned—all the ones Jinny had seen. They were not quite identical copies. For one thing, in nearly every case the quality of the copy was slightly better than that of the original.

Suddenly I felt vastly tired. I didn't feel like boggling anymore, or struggling not to. "Mr. Rennick—Alex—I thank you for your offer of a tour of the North Keep, but I believe I will pass, at least for tonight."

"Certainly, Joel. If there's nothing further I can do for you now, I'll leave you to rest."

"I'm fine. Thank you."

"Good night." He left. I watched through a window as he walked across the field and through the pink smoke of the door-without-a-wall. I looked around the "farmhouse," then back out the window at a sky with two moons, and thought about bursting into tears, but I decided I was too manly

"Leo?"

"Yes, Mr. Johnston?"

"Can I get a cup of coffee?"

"On the desk, sir."

I blinked, looked—a steaming cup of coffee sat on the desk beside me. It hadn't been there a moment ago, but I hadn't noticed it arrive. Without a word I picked it up and tried it. The superbness of the coffee was no surprise at all. The *perfect* drinking temperature was only a mild one. But the cream and two sugars

"Did Jinny tell you how I like my *coffee,* Leo?"

"Miss Jinny has told me many things about you, Mr. Johnston."

"Call me Joel."

"Yes, Mr. Joel."

I opened my mouth, then closed it. There must be something sillier than arguing with software, but I can't think offhand what it would be. I sat down on a rocking chair that creaked authentically, put my feet up on a hassock, and began to dismiss Leo from my mind, to prepare for the upcoming conversation with Jinny. Then a thought occurred. Carefully not addressing him by name I asked, "How long do you keep listening after I stop speaking, before you conclude I'm done and stop listening again?"

Answer came there none. Which answered me: somewhere between five and ten seconds. Useful datum.

"Leo?"

"Yes, Mr. Joel?"

"Can you let me know just before Miss Jinny arrives here?"

"No," she said from the doorway. "He can't."

We were both tired, and both emotionally upset. But we both knew there was more to be said before we could sleep. I took my feet down off the hassock, and she came and sat before me on it, and took both my hands in hers.

"No more ducking and weaving. Spell it out for me," I said. "In words of one sound bit, what's the deal?"

She was through dodging. "I'm proposing marriage, Joel. Just as we've discussed: lifetime, exclusive, old-fashioned matrimony. And I'm offering to support us . . . uh, at least until you get your degree and start to become established as a composer and start earning. I can afford it. I'm quite sure you'll get that Kallikanzaros Scholarship—but if you don't, it won't matter. And best of all, we can start our first baby right *away*—tomorrow night, if you want."

"Huh? Skinny, what about your degree—your career?"

"My second career, you mean. It'll keep. I've always known what my first career has to be." She tightened her grip on my hands and leaned slightly closer. "Stinky, maybe now you'll understand why I've been so . . ." She blushed suddenly. "So frimpin' stingy. So square, even for a Terran girl. Why I don't park, or pet, or sneak out after curfew, and why our clinches never got out of hand—or even into it, so to speak. I think you know I haven't wanted to be that way. But I had no choice. It may be all right for some other girls to bend the rules and take risks, but me, I've had it beaten into my head since I was three that I have responsibilities."

"The family name."

"The family name my left foot! The family *genes.* Stinky, I'm a female human animal; my number one job is to get married and make babies. And because I'm who I am, a member of a powerful dynasty, it makes all the difference in the world what baby I have—and who its father is." She let go of my hands and sat up straight. "You're it. This is not a snap decision."

It began to dawn on me that I was not merely being offered acceptance into the fringes of the Conrad family. I was being asked to father its heirs.

On Ganymede I'd grown up seeing stud bulls brought in and put to work. They were always treated with great care and respect, very well fed, and certainly got all the healthy exercise a male animal could possibly want. Their DNA was vastly more successful than that of most other bulls, and their own lives vastly longer. Nobody made jokes about them in their hearing.

But I couldn't recall one who had looked very happy about the business.

"Don't look so worried, Stinky. It's going to work out fine. You *do* want to marry me, we settled that, right?"

I opened my mouth—realized I was harpooned, and closed it again. I had stated that only money prevented me from proposing; I didn't have a leg to stand on.

Nevertheless I found myself on my feet and being embraced. I had to admit it was a very nice embrace, warm and close and fragrant. "Then it's all really very simple. All you need is a nice long chat with Gran'ther Richard. You'll love him, really. And I know he'll love you."

I stiffened in her arms, and fought with the impulse to faint. Good old Grandpa Richard. Known to the rest of the Solar System as Conrad of Conrad. The patriarch. The Chairman. I'd heard he had broken premiers. But perhaps the most awesome thing about his wealth was that, when I thought about it, I didn't actually know a single fact about him, save his name and exalted position. I'd never read an article about him, or viewed a bio, or even seen a picture of his face. For all I knew he had taken my cloak when I arrived. Harun el-Hatchek.

She released me and stepped back. "You'll see him first thing tomorrow. He'll explain things. And then afterward you and I will have breakfast together and start to make some plans. Good night, Stinky."

We parted without a kiss. She didn't offer, and I didn't try. I was starting to feel resentment at having been played for so long—and also I flatly did not believe there were no cameras on us.

After she was gone, I thought about firing up that Universal Access Rennick/Smithers had mentioned, and researching the size and scope of the Conrad empire. But I knew if I did so here, now, on this computer system, Gran'ther Richard would know about it. It just smelled ripe to me. Milady brings home a handsome hick, and the first thing he does is start pricing the furniture. The thought made my cheeks burn.

Instead I used that UA to google around until I had figured out the "Smithers" gag. It turned out to be just as well Rennick didn't know the reference—if in fact he really didn't. Jinny was comparing him to an ancient cartoon character who was a cringing bootlicker, a toady, a completely repressed monosexual, and an unrequited lover. I wondered how much of that was accurate and how much libel. And just how far the analogy was meant to go: Smithers's employer in the cartoon, a Mr. Burns, was vastly rich, impossibly old, and in every imaginable way a monster. Did he represent Jinny's grandfather? Or father?

Well, I would find out in the morning. Or maybe I would get lucky and be struck by a meteorite first.

The bed turned out to be just like mine back at the dorm, except the mattress was better, the sheets were infinitely softer and lighter, and the pillow was gooshier. Was I hallucinating, or did the pillowcase really smell faintly of Jinny's shampoo? It certainly did put a different perspective on things. It might be nice to smell that on my pillow *every* night from now on. And every morning. If in fact I was really smelling it now. While I was wondering, I fell asleep.

Three

"Joel. It's time to wake up, dear."

Yes, that was definitely her hair I smelled.

I had heard Jinny say just those words, in much that low throaty tone of voice, at the start of more than one pleasant dream. It was a novel experience to hear them at the end of one. Now if only everything else would continue to unfold as it usually did in the dream. . . .

I opened my eyes and she was not there. The scent was either vestigial or imagined. *Drat.*

"You really need to wake up now, Joel," she murmured insistently from somewhere nearby

"Okay," I said.

"Wake up, Joel. It's time t—"

I sat up, and she chopped off in midword. She wasn't there. Anywhere.

I wake up *hard*. I had to sit there, lot a few seconds before I had it worked out. The speaker was not Jinny but Leo the AI server, perfectly imitating her voice while acting as an alarm clock. Doing the job well, too: I could fool my own alarm at the dorm by simply telling it I was getting up. Leo was programmed to accept nothing less than verticality as proof of compliance.

Why did I need to get up now? I could tell I had not had eight hours' sleep. I had graduated, for Pete's sake—what was so urgent?

It all came back to me at once. Oh, yes. That's right. Today I was going to have a personal interview with one of the most powerful men in the Solar System. Had I supposed it would be scheduled for *my* convenience? A man like Conrad of Conrad would doubtless want to dispose of matters as trivial as meeting his grandchild's fiance as early as possible in the business day

"How soon am I expected?" I asked.

"In half an hour, Mr. Joel," Leo said in his own voice.

"How do I get breakfast?"

"I can take your order, sir."

I started to say scrambled on toast, bucket of black coffee, liter of 0J. Then I thought to myself, this morning you are going to have a personal interview with one of the most powerful men in the Solar System. "Eggs Benedict, home fries, Tanzanian coffee—French Press, please, two sugars and eighteen percent cream, keep it coming—and squeeze a dozen oranges."

Leo returned the serve. "Very good, Mr. Joel. Do you prefer peaberry or the normal bean?"

"The peaberry, I think," I managed.

There was a scratching sound at the door. It opened, and a servant entered, pushing a tray ahead of him at shoulder height with two fingers. He was easily as old and as ugly as the servants I'd seen the night before, but nowhere near as surly. Maybe day shift was better.

"What's that?" I asked.

He steered the tray to a table near the bed, and somehow persuaded it to sit down. "Eggs Benedict, potatoes, coffee, fresh orange juice, and this morning's news, sir," he said, pointing to each item as he named it. Nothing in his manner suggested that only an idiot would need these things named.

I promised myself that just as soon as I had the time, I would wonder, very hard, about how any of those items could have been produced instantly, much less all of them at once. But meanwhile, there was no sense pretending they had not caught me by surprise. "If I'd known how fast the service is here, I'd have asked them to wait ten minutes, while I used the 'fresher," I said with a rueful grin.

He turned to the tray, made some sort of mystic gesture. The food became obscured by a hemisphere of . . . well, it looked like shimmery air. "Take as long as you like, sir. Everything will be the same temperature and consistency when you get back out."

Oh. Of course. I wondered how the hell I would get the air to stop shimmering, but I was determined not to ask. I'd figure it out somehow

"Just reach right through it, whenever you're ready, sir," he volunteered. "That collapses the field."

I opened my mouth to ask what kind of field, how was it generated, what were its properties—and stifled myself. There would be time for that later. "What is your name?"

"Nakamura, sir."

"Thank you, Mr. Nakamura. You're very kind."

"You're welcome, sir. And thank you." Somehow he was gone instantly, without hurrying.

I started to get out of bed . . . and the damned thing *helped* me. The part right under my knees dropped away, and the part under my butt rose, and I was on my feet. I reacted pretty much as if I'd been goosed—the physical sensations were not dissimilar. I said the word "Whoa!" louder and an octave higher than I might have wished, leaped forward a meter or so, and spun around to glare accusingly at the bed.

"Is something wrong, Mr. Joel?" Leo asked.

I took a deep breath. And then another. "Not yet," I stated cautiously.

On the way to the 'fresher, I passed close to the tray of food. I could see a cup of coffee in there, and wanted it so badly it brought tears to my eyes. But I knew if I "collapsed the field" now, I probably wouldn't be able to re-create it again. And besides, there was the question of making *room* for the coffee.

So okay, I would hurry and be out of the 'fresher in five minutes instead of ten. I stepped in. . . .

On Ganymede we're more reticent about such matters than Terrans—for complex sociocultural reasons I'd be perfectly happy to explain any time you have an hour to kill listening to a guy who doesn't know what the hell he's talking about. So I'll just say that this 'fresher was about ten times better equipped and programmed than I had ever imagined possible, and let it go at that. It was more like fifteen minutes before I was able to make myself end the sybaritic cycle.

When I came out, my clothes were gone.

I remarked on this, as casually as I could manage. Leo explained that they had been taken away for laundering. He invited me to wear any of the fakes in the closet that pleased me, and assured me, unnecessarily, that they would all fit me perfectly.

I was not at all happy about this, but I could see my wallet, phone, and keys on the bedside table, so I postponed the matter until after coffee.

By the end of the first cup, I had no strong objection to anything short of disembowelment or denial of a second cup. If you are ever given the choice, insist on the peaberry. Trust me.

When I was ready to dress, I automatically reached for the copy of my best suit, comforting myself as best I could with the guess that this version of it, at least, would be freshly cleaned, and would not be worn nearly through in spots. But as I took it from the closet, I noticed an item hanging just behind it that certainly was not a copy of any garment I owned. It was a J. L. Fong suit. Top of the line, of the latest cut and style. In a color, I noticed, that would complement Jinny's hair. It was worth more than my entire wardrobe—more than my passage to Earth had cost. The tights were just a bit daring, but I decided I had the calves to carry them off. I was unsurprised to find suitable underwear and other necessary accessories in drawers, tucked in among my own trash.

The moment I put it on, that suit became an old, familiar, and valued friend—and I became taller and wider across the shoulders. It could not have fit better if it had been made on my body. It knew things about me I wouldn't learn for years yet, and approved of them all. Wearing a suit like that, you could break up a knife fight with an admonishment, secure a milliondollar loan without being troubled for a signature, walk away from a crime scene, or obtain illicit drugs on credit. I examined the effect in the 'fresher room mirror, and decided that on me, it looked good. Perhaps, I felt, I could even survive an interview with Conrad of Conrad without soiling it. If it was a brief interview.

"Will Jinny be present at this meeting, do you know?" I asked Leo.

"No, Mr. Joel. Only Mr. Conrad, Mr. Albert, and yourself."

I blinked. "Wait a second. *Which* Mr. Conrad? Jinny's father, or her grandfather? And who's this Albert bloke?"

"Ah. Pardon me, Mr. Joel. There are over a dozen adult males in the immediate family whose last name is or incorporates Conrad—but by longstanding family and corporate tradition, there is only one 'Mr. Conrad' at any one time. At present that is Jenny's grandfather, Mr. Richard Conrad—Conrad of Conrad. The others are Mr. Joseph, Mr. Chang, Mr. Akwai-N'boko, and so on. Mr. Albert is Jinny's father."

"I see," I said. "Thank you." I began to understand Leo's insistence on putting Mr. before my name. I started to ask where Jinny was now, and realized the answer would probably mean nothing to me.

I paid attention to my breathing, trying to make it slower and deeper, for another twenty seconds. Then I said, "Okay, I'm ready"

"Very good, Mr. Joel."

I left the faux farmhouse, and walked through faux fields. It *smelled* convincingly like morning on Ganymede, and don't ask me to explain that. It felt inexpressibly weird to be walking through a colonial homestead, in the wrong gravity, dressed like an aristocrat, heading for a doorway of pink smoke. It was a bit of a relief to walk through the smoke and find myself in an ordinary corridor that smelled like Terra instead of Wonderland.

"I'll guide you from here, sir," Leo said. "Do you see the light at your feet?"

I glanced down, and there was a soft green light at the baseboard of the lefthand wall, pulsing on and off. It was about the size and intensity of a firefly: discreet, but impossible to miss. "Lead on," I said. It moved away.

"If you'll forgive a personal observation, sir," Leo said as I followed his blinking firefly down the corridor, "you have an excellent time sense for a human."

"Excuse me?' "

"You said, 'Okay I'm ready' twenty-nine minutes and forty-one seconds after I advised you that you had thirty minutes to prepare."

"Ah." I nodded. "A couple of people have told me I have a pretty accurate internal clock."

"Extremely so, sir, if this example is representative."

I shrugged. "I never burn the toast. Look, I have some thinking to do, all right?"

"Yes, sir. I'd just like to—"

"Later, Leo."

"But, sir—"

I was raised to be polite to gadgets—Dad always said it was good practice—but I was trying to get some fretting done and Leo was distracting me. "Quiet!"

He shut up, and I put my full attention on the predicament I was in. First I scanned my memory for everything I had ever heard or read about high-level etiquette, manners, or protocol. Unfortunately that only took me about two steps. Then I examined my own autobiography, looking first for things that might impress a multi-octillionaire—and when that failed, making a short list of spots that might alienate one, and going over my excuses. A step and a half, tops. As I followed the blinking green firefly around a corner, I was trying to decide whether the next priority was to imagine all the possible ways this upcoming meeting could go wrong, or to try and work out exactly how I had gotten myself into this, where I had taken my first misstep—

--when I rounded the corner, and encountered eighteen kilograms of mass coming in the other direction.

I weighed four times that much. But it caught me well above my center of gravity—square in the face—and was moving much faster, packing more kinetic energy. I believe the Terran expression is, who knows why, "ass over teakettle."

I've taken self-defense courses. I know how to fall properly, and do so as a matter of reflex in normal conditions. But not in a one-gee field. I went down *hard* on my back, and all my air left me in a single explosive syllable, and only the extreme thickness of the carpet kept me from cracking my skull. I remember feeling quite unhappy for a moment, there. Then the eighteen-kilo mass landed on my groin, and I felt much worse.

Sometime later I forced my eyes open. Closed them quickly. Reopened them cautiously. Half a meter from my nose, a little girl —"Why don't you look where you're going?" she asked.

Make a mental note, Joel: next time you tell an AI you want quiet and it keeps talking—listen. "Because I'm a dolt."

"Oh." She thought about that. "I'm a Conrad."

I looked her over. She appeared to be somewhere around seven Terran years old. And adorable. "Are you all right?"

She frowned, and stuck her chin out slightly. "Yes, I am. Daddy says I don't have bones." She moved her gaze away. "But I think my skyboard's broke."

The object named lay beside us. It looked like a conventional skateboard—minus the usual wheels, motor housing, onboard computer, and data port. Like a miniature surfboard, in other words. I had no doubt that it could fly—when it wasn't broken—because it had been at head height when I'd first encountered it. But I could not guess how.

"I'm sorry." I'd have to replace it. There went my scholarship, probably. "Uh, what's your name?"

"I'm Evelyn."

"Hello, Evelyn. That was my mother's name, too. I'm—"

"You're Joel, of course. I'm not a *baby."*

"Certainly not! Not by a good ten kilos."

She giggled—then frowned. "Am I hurting you?"

"Only when I breathe."

She was off me and up on her feet at once. "Jinny is my favorite cousin. I think she's rickety all through. Don't you?"

"Yes. I think I do, anyway." I sat up. When that didn't kill me, I got to my feet and examined my costume for damage.

"Are you going to marry her?"

I opened my mouth and closed it again, twice. "We're still discussing that," I managed finally.

"Do you love her?"

"Evelyn, I'm afraid we'll have to finish this conversation another time. I'm late for an appointment with your—" What would the relationship be? "For a very important appointment. Please excuse me."

She grinned. "Never mind. I saw you blush."

I did it some more. This was Jinny's cousin, all right. "I really mustn't be late."

She waved a hand majestically. "Don't matter about it. Just tell Grandfather Rich I made you late."

I realized my flashing-firefly guide was beginning to move off down the corridor: hinting. "It was wonderful to meet you," I said hastily "Sorry I broke your board. I'll get a new one to you as soon as I can."

She giggled. "You're silly."

I followed her pointing finger. A new skyboard was just arriving, gliding along the corridor at knee height. It was as featureless as the other, not so much as an antenna showing. Suddenly I saw that the firefly had nearly reached a corner. In another few seconds it would be around the bend. "Great. I'll see you around."

"It's okay, Joel. Gran'ther Rich will think you're rickety-tickety. You'll see."

I know a compliment when I hear one. I bowed—and did not quite sprint away. I found the firefly around the corner, waiting for me, but pulsing faster to indicate impatience. I breezed right past it at double time, made it scramble to catch up and pass me again, and felt the tiny satisfaction that comes to an idiot who has successfully insulted a piece of software. I slowed to walking pace—and it kept on going at double time. I ended up reaching my destination slightly out of breath, and not quite dripping sweat.

I planned to pause outside the door for at least two or three deep breaths. But the infernal thing opened as soon as I reached it. I allowed myself one breath, mostly because I had to, and entered.

But it was only Rennick's office.

He did *not* say, "You're late," even by facial expression. But in the time it took me to walk three steps into the room. he had risen from his workstation, come all the way round it, and reached my side, without seeming to hurry "Good morning, Joel," he said pleasantly. He took my elbow, turned me, and we were back out in the corridor and walking again—not as fast as I had arrived, but not slowly either. "I trust you slept well."

"Yes, thank you, Alex. And yourself?"

"There are things I must tell you, and we no longer have time for the standard set speech. As you know, there is only one Mr. Conrad in this house, and that is what he is called in his presence or out of it. But when one directly addresses him, he prefers, strongly, to be called simply Conrad. Thus, you might hear someone say, for instance, 'Mr. Conrad approves of this—isn't that so, Conrad?' Am I clear?"

"No honorific to his face. Not even 'sir'?"

"Not even `sir.' `Yes, Conrad.' `No, Conrad.—

I nodded. "Got it. Thanks. Do I call Mr. Albert 'Albert' to his face, too?"

"Not unless he invites you to. Which is unlikely. Until then he is Mr. Albert."

We came to a checkpoint. Five large men, four of them heavily armed and the deadliest one sitting at a workstation. Rennick didn't even slow down, and nobody killed him, so I didn't slow down either.

"Mr. Conrad does not shake hands. Mr. Conrad does not care for humor. Mr. Conrad is not interrupted."

Right turn. Another checkpoint. Another five armed men, but not large this time. Gurkhas. Their knives were sheathed. Rennick came to a halt and stood still, but ignored them. I did likewise. I could almost feel myself being scanned and sniffed and candled by invisible machinery

"When Mr. Conrad says 'Thank you,' he means 'goodbye.' The correct response is *not* 'You're welcome,' but 'Yes, Conrad.' You say it on your way to the door."

"Got it." A Gurkha produced something I'd only seen in cop or spy stories, and gave it to Rennick: an identifier. He held it up to his eyes like binoculars for a moment, then poked his right index finger into a socket on the side, and removed it. Almost at once there was a soft chiming sound, and a blue light on top of the device flashed three times. Rennick passed the device to me.

Fighting an impulse to grin like an imbecile, I lifted it to my own eyes and looked into the lenses. Nothing but a white field. I lowered it, hesitated a second, and stuck my finger in the slot. I expected to be poked for a blood sample, but what I got was even more disconcerting, a sensation as if someone were sucking gently on that fingertip. Whether it was taking skin scrapings or sampling my fingernail I couldn't say. In any event it decided it approved of my DNA and my retinas, and awarded me the same chime and flash Rennick had received.

The Gurkha's forearms and hands relaxed slightly, and his cousins relaxed too, slightly. He accepted the identifier back from me, saluted to both me and Rennick, held it, and stepped smartly backward out of our way. Rennick was off again at once, with me at his heels.

I wondered if anyone else in the Inner System was as paranoid as these people. Or, now that I came to think of it, had better reason to be.

The pause had been almost enough to let me get my breath back. "Anything else?"

"Yes. A piece of personal advice. There's only one way to say this. Don't bullshit. If Mr. Conrad asks you a question and you don't know the answer, there is only one acceptable response—'I don't know Conrad.' Try and bluff, and he'll smell it."

We came to a large door that looked like a polished slab of real wood. It lacked the customary ID scanner, but at about the same location it had an antique fitting I guessed at once must be the fabled doorknob: a flattened toroid like a brass onion, sticking out from the door on a short horizontal stalk. I wasn't quite quick enough to catch the procedure Rennick used to operate it. It was hard to follow: some sort of small probe, a quick torquing motion, and a small *clack* sound. Cued by the sound, I was not too surprised when the door swung inward away from us instead of dilating: it actually was a polished slab of real wood, a good fifteen centimeters thick. I followed him through the doorway, and had to step out of the way so he could swing it shut behind us. I was sure we had reached the Holy of Holies, at last.

Wrong again.

It certainly *looked* very like what I had been expecting to see: the serious working office of a major CEO or senior politician, tastefully decorated and lavishly equipped. It had every imaginable sort of monitor screen, display, input device, peripheral or other gadget, but the utilitarian effect was softened by a carefully chaotic profusion of exotic and lovely plant life. Dominating the room was a huge piece of furniture as obsolete as the doorknob, for some reason called a desk even though it had no graphic interface or surface icons—not even a trash can. It was basically an elaborated table intended to provide a stable flat work surface plus storage drawers. In films, such a desk is usually covered with items: a primitive telephone, a keypad and monitor, family flat photos, styli, and so on. This one was as austerely, majestically bare as I would have expected from a man of great power.

Two things immediately spoiled the picture, though. First, the absence of any men in the room. And then, the presence of a woman behind the desk. Her apparent age was five years higher than my own, and the fake was very impressive, but there were at least seventy years of skepticism in those eyes and the set of her mouth.

"Morning, Dorothy," Rennick said. "This is Joel Johnston. Joel, Dorothy Robb."

"Good morning, Alex," she greeted him. "Relax: you're early. And good morning to you, too, Mr. Johnston." She offered me her hand. Her voice was wonderfully husky, like a great jazz singer near the end of her career; I wondered if she sang.

In my social circle, my move would now have been to shake her hand firmly and release. I had no idea what was done at this altitude—even if I'd had a clue what our relative status was. Deep breath. What would Dad do? "Good morning, Ms. Robb," I said, did my second-best bow, and kissed her hand.

She removed it quickly and said, "Dorothy!" sharply, but I knew she was not offended because almost at once she softened it by adding, " 'Ms. Robb' sounds too much like—"

I nodded. "A Victor Hugo novel. In that case, I'm Joel."

Those cynical eyes opened a bit wider. "You read!"

"My parents infected me before I knew any better. There was no bedtime, as long as I was reading a book."

"What splendid parents."

Suddenly I felt myself blush. My multitrack mind was still playing with our pun, and it had suddenly realized that the full title of the book we were discussing would have been *Lay Ms. Robb.* Her sharp eyes caught me blushing, and twinkled. I realized I'd made no response to her compliment, and was too flustered to formulate one.

She saved me. "Do you know the story of the American farm wife who wrote a letter to Victor Hugo, Joel?"

"No, I don't," I said gratefully

"She wrote, 'Dear Vic—I couldn't help smiling; her accent and deadpan delivery were good. " 'We shore liked that book you wrote there, Less Miserables' "—I began to grin broadly, and Rennick did, too—" 'but we wanted to ask you one thing we cain't figger out: which one o' them characters was Les?'" I broke up, turned to Rennick, and saw that he was chuckling, too—and had absolutely no idea why. Oops. Oh, well—no reason his education should include period French literature. No reason anyone's should, really.

"What a glorious story," I said to Dorothy "Is it apocryphal?"

"Oh, I hope so. Imagine the poor man trying to compose a response." I decided to take the bull by the horns. "May I ask your job title, Dorothy?"

She snorted. "Professional bureaucratic-gibberish composers have wept with frustration over that one. There doesn't seem to be an adequate descriptive that any of them liked. For accounting purposes we finally settled on Enabler, which they simply hate."

"Like a personal secretary, sort of?"

She did not smile. "Mr. Conrad has *seven* personal secretaries. One executive secretary, two research secretaries, a social secretary, a scheduling secretary, a record-keeping secretary, and a personal private secretary. Plus assorted personal executive assistants and chiefs of staff and first facilitators and chief counselors and senior advisors and legal counsels and a personal physiotherapist and several personal physicians and psychiatrists—a clinic, really—plus an incredibly complex impossibly sprawling extended personal family. And then of course there is the empire itself, with its hundreds of CEOs, comptrollers, and so on. And finally there are the various executives, and executive, legislative, and judicial branches, of a great many governments. I am one of two people through whom he accesses all those people. And vice versa. I have the 6:00 A.M. to 6:00 P.M. shift—or 1:00 P.M. to 1:00 A.M. Greenwich."

I blinked. "And you have time to tell me Victor Hugo jokes?"

"No. That's why I enjoyed it so much. You looked like you needed relaxing."

"I still do! How much time do I have?"

"None," she said. A previously unsuspected door occurred behind her. "Good luck, Joel."

Rennick stepped forward and entered. I didn't. The powers of motion and speech had deserted me.

"You'll be fine," she murmured. "The suit looks terrific on you."

When you're too scared to move, there's a simple fix. I'm not saying easy—but simple. Just lean forward. That's all you need to do. Keep it up long enough and you'll fall on your face—but your body won't let you. It will automatically put a foot out . . . and now you're moving forward. Repeat as needed. Remember to alternate feet.

Before I knew it I was passing through the doorway, lurching only slightly.

Four

To understand the heart and mind of a person,
look not at what he has already achieved,
but what he aspires to.
—Kahlil Gibran

The room was not small, but smaller than I had expected, and further surprised me by being furnished more like a den or a study than an office. At the far end of the room was a conversational grouping of four chairs. Rennick was just reaching the leftmost of the two that faced away from me. The two facing toward me were already occupied. In each sat a man who appeared to be approximately Rennick's age. The fourth chair, its back to me, was obviously the hot seat.

My feet wanted to stop in their tracks again. But I managed to keep leaning forward. As I headed for the death chair, I invoked my very sharpest self-criticism. *You have not thought this through.*

Myself replied with some asperity, And *how the* hell *was I supposed to do that,* churn? *Using what data?*

Social customs on Ganymede are considerably simpler and more direct than those on Earth: a frontier society is just too busy for indirection, innuendo, and ceremony. Nevertheless, I had, under Jinny's tutelage, gradually managed to soak up enough Terran manners to get by, in the sorts of social situations in which I found myself. It had been some time since I'd heard anyone mutter, "Hayseed!" under their breath after a conversation with me.

But college life had not prepared me for this. I was in a milieu where I knew I had no faintest idea what constituted correct behavior—and I was already saddled with some complex and difficult social problems that I had about a dozen steps to solve, for the toughest audience on the planet.

When in doubt, I decided, fall back on analogy. Okay . . . royalty always takes precedence, that gets you started. Which one next? And how . . . ?

I'd expected those twelve steps would seem to take forever. They-turned out to be just long enough.

Part of what threw me was the apparent ages. Both men I was here to meet seemed to be middle-aged, somewhere between thirty and sixty. Neither visibly deferred to the other by body language or chair placement. Both were dressed equally well, which was very well. Both carried themselves with authority and confidence, and had "the look of eagles"—a constant hyperalertness I had seen before only in certain very good bodyguards like the Gurkhas out in the hallway, and in a Zen priest I met once.

So which one was Jinny's dad . . . and which one merely owned half the inner Solar System?

When I reached the decision point, I put down my money, made my bet, and quit worrying. The rest of the necessary choices seemed to have been made while I was busy.

I stopped in front of the man to my right, bowed *almost* as deeply as I would have for the Secretary General or for Jinny, and said, "Good morning, Conrad. I am Joel Johnston. Thank you for taking me into your cubic. Your home is most gracious. Pardon me a moment, please."

Without waiting for a response I turned on my heel and gave Rennick my warmest smile. "It was very kind of you to escort me here, Alex. I'm sure with Leo's help I'll find my way back to my quarters."

His own smile congealed slightly at the edges, and he opened his mouth as if to reply.

"Thank you," I said pointedly.

After an instant's hesitation, spent in reappraisal of me, he did a little indescribable thing with his mouth that was a rueful salute, and nodded. He said, "You're welcome," on his way to the door.

Again without pausing, I turned to the second man, bowed almost as deeply as I had to the first, and said, "Mr. Albert, I am Joel Johnston of Lermer City, Ganymede. My parents were Ben and Evelyn Johnston of that city. I am a recent graduate of Fermi Junior College. I love your daughter Jinnia—more than I can say!—and she loves me. I'm declaring now my intention to ask you for her hand as soon as I can. I will supply Dorothy Robb with what is necessary to allow you to inspect my background and records."

I was done. I had shot my bolt—nothing to do now but wait and see just how badly I'd screwed things up. The door whispered shut behind Rennick, and sealed me in here in the lions' den.

The man last addressed stared up at me, absolutely expressionless, yet with an attention that was almost a physical force, as if any slightest muscle twitch on my face might tell him something crucial. He stared for so long I began to suspect that I had botched the whole thing, guessed wrong—that he was not Mr. Albert, but the Lord God Conrad himself. I wished I could sneak a glance at the other man for a clue, but did not dare take my gaze away from his.

"Well and boldly spoken," he said at last. "My daughter has made an interesting choice, Mr. Johnston. Good luck to you."

It wasn't until I exhaled that I realized I'd been holding my breath. Those were the last words he said to me.

"How did you know which of us was which?" the other man asked. "You can't have seen a picture of me. There are none."

For a split second I thought about claiming to have had the foresight to google up a picture of my fiancee's father, last night. Rennick's advice came back to me. *Don't bullshit.* "I did *not* know, Conrad. I was forced to guess."

He nodded. "On what basis?"

I didn't have a clue. But my mouth did. It opened, and out came, "Jinny's cheeks."

"What did you say?"

Why, yes. I could see what my mouth meant, now that I looked. "Jinny's cheekbones, s—Conrad. Cheekbones and ears. They're distinctive. Mr. Albert has them, too."

He mimed the word "ah," without actually emitting sound. Mr. Albert was poker-faced.

I was beginning to understand why there were no pictures of Conrad of Conrad. There's an expression actors use: "He can't wear the clothes." Meaning that actor, however talented he may be, just isn't right for that part. No one would have cast this man as Conrad.

Not that he was in any way unimpressive, quite the contrary. He just didn't look nearly heartless or soulless or ruthless enough to fit my preconceptions of the head of a multiplanet empire. He looked ... learned, and wise, and kind. He would have been excellent casting for, say, a brilliant college professor. In some warm, fuzzy subject, like ecology, or sociobiology, or poetry, or even theology. His students would all love him, and write him letters years later to tell him he'd changed their lives. But he would never make department chairman because he wasn't willing to kill for it.

I knew this impression had to be utterly false. This was Conrad of Conrad. But he did not bear the kind of face that would inspire the countless armies of remorseless sharks in suits who constituted the Conrad empire. He had the kind of face that would reassure their mothers. He was more effective as a Man of Mystery, never seen.

"Have a seat, Joel," Conrad said.

It was a superbly comfortable chair, and became more so the longer I sat in it. This wasn't going so badly .. .

"I am informed that my granddaughter Jinnia Anne has revealed her true identity to you, and you have accepted her proposal of matrimony—"

I opened my mouth but no sound came out.

He went on quickly, as one who is determined to get through his little speech however banal it may be. "I commend you heartily on your good fortune, Jinny on her good sense, and both of you on your good taste; I wish you both every happiness; I am confident you will prove a welcome and valuable addition to our great family; we will now define the terms and conditions under which that may occur—"

I opened my mouth even farther. Even less sound came out.

His eyes narrowed very slightly. The department chairman reluctantly suspected me of plagiarizing my thesis. "—unless you would feel more comfortable represented by counsel?"

I had to reject the slander. "No!" I managed to say, and got nearly halfway through my follow-up monosyllable, "I—" before he steamrollered ahead.

"No, of course not. Excellent. I'm sure Jinny has made her family situation clear to you, explained all the ramifications, brought you up to speed." She damn well had not! "Preliminary genetic analysis is satisfactory, as expected given your heritage." Apparently my consent had been assumed. "I might add that I consider such analysis a mere pro forma check on my granddaughter's intuition and judgment: you were in the moment she said you are. But I am pleased with her choice. I met your father, you know. Many years ago, when he came Earthside to receive his prize."

"Then you met me," I blurted out.

"Eh?"

"I never left his side, that trip."

"Ah." He did the math, worked out how old I would have been. "Oh!" He started slightly at a memory. "Uh . . ."

The only vowel he had not tried in front of an "h" yet was "i"—and perhaps "y" What was his problem?

Then all of a sudden I remembered, too.

"Ih!" I gasped. "I *bit* you."

I'd never seen anyone try to unfrown, before. "Yes." He gave up and surrendered to the frown. "You did." Then without warning he smiled, so broadly it was as if another man had burst out laughing. "Good for you!" It made him look much younger, and it took me an instant to work out the sad reason why: his smile wrinkles were almost entirely nonexistent. I tried to remember why I had felt he needed biting, back then, but failed. All I could recall was the fuss after I had done it. *Everyone* had been upset . . . except Dad. He had apologized for me—once—and then stopped hearing conversation about the matter.

"And good for Jinny, too," he went on. "I'm more convinced than ever that she's found just the man we need. And just when we need him, too."

" 'We'?"

We frowned at each other for a few seconds.

"I don't understand your question," he said. "Unless you are speaking French."

"I guess," I said slowly, "I had the idea marriage involved the *needs* of just two people, and the *interests* of the rest of their families. So far, *I've* been thinking exclusively of Jinny's needs and mine. If you need me for something, it has not yet been explained to me, and I have not yet agreed."

His jaw did not drop. But his lower lip went slack, and his eyes unfocused slightly for a moment. Then he shook his head. "I know you are not stupid; I've seen your genes. I know you are not ignorant; I've seen your transcripts. It has to be . . . a rather *staggering* naivete."

I didn't know what to say to that.

"Joel, do you honestly believe your marriage is going to be a normal, mundane union? Do you think its purpose is simply to provide the two of you with agreeable companionship and licensed sexual relief? Can you really imagine that your life together will be anything like what you were picturing as recently as yesterday morning?"

Well, no. But neither could I imagine what it would be like. The furthest I had gotten in my thinking so far was trying to encompass the preposterous notion that I could stop balancing my checkbook, now: that I would never again be short of money, no matter how much I developed a wish for. "What will it be like?"

"You kids will marry and continue in school under the name Johnston, but your legal name will be Conrad. Your training has been planned for you by experts familiar with your background and capabilities—at least ten years, and as a minimum you'll take degrees in engineering, law, business administration, one of the practical sciences, and a language. I suggest Portuguese, but of course that's up to you. It won't all be academic fun and games, of course: you'll need field experience in the company, as many areas of it as you can handle. Plus additional special coaching in social skills, and in politics, both governmental and corporate, and—"

"But you're sure you won't mind if I go for Swahili instead of

Portuguese?"

"Anything but French."

I gave up on sarcasm. He honestly didn't know what it was. "You're talking about grooming me for a top executive position in the Conrad empire. What makes you think—" I stopped because he was shaking his head.

"Not *a* top position," he said.

I felt the blood start to drain from my head. "Are you trying to tell me—"

"Listen to me, Joel." He leaned forward slightly, and his chair adjusted at once. "It is conceivable that one day you might sit in this chair and give the orders. It is even likely, on the basis of what can be extrapolated from your ancestry, present abilities, and accomplishments to date. It is *certain* that one or more of your children will sit in this chair one day. I've had you *most* fully investigated, else Jinny would never have received permission to propose to you."

I felt two extremely strong and inappropriate impulses, fortunately so contradictory they canceled each other out: the urge to faint, mid the urge to giggle.

"Oh, I understand," he said. "Really I do, son. Your interest in music is commendable in one of your age, a sign of a mathematical mind, and Jinny assures me your work is agreeable, not at all like this . . . well. But surely you see the time for childish things is now behind you. The *real* world is now open to you: you've been given the opportunity to become one of those men music is written *about."*

Conrad continued speaking for several more minutes, and I kept an attentive look on my face, but I'm afraid it all pretty much went in one ear and out the other from that point on. To the best of my addled recollection he was explaining my destiny to me. Telling me about challenges I would face, and things I would need to know to meet them—about looming crises and how to resolve them—about potential achievements and how best to realize them. He used the word "scarcity" several times. I think he was trying to give me a short course in how to run a commercial empire over the next hundred years or so. He went on and on about the crucial importance of making sure humanity was firmly established outside the Solar System. Something about the System, any system, being too fragile a basket for the human race to keep all its eggs in. It seemed paranoid thinking even for a Conrad.

I have no doubt there were thousands of people in the System at that time who would have given a limb, maybe even one of their own, to hear that lecture from that man. It's a real shame I missed it. But my brain was so busy trying to think six contradictory thoughts at once that it had no processing power left over for new incoming audio or video. He could have told me the exact hour and manner of my own death, and I'd have kept on looking him in the eye and nodding thoughtfully. I think Mr. Albert may have realized I wasn't tracking, but he kept silent.

Sooner or later, he would pause long enough for me to speak. I had until then to come up with some really smooth, diplomatic way to begin explaining to him how many erroneous assumptions he was making, how vast was the gulf between his picture of my future and my own. The trouble was, for the life of me I could not think of any diplomatic way to express the concept, "I'm not remotely sure I want any part of you or your family or your empire, and I'm having serious second thoughts about your granddaughter." I could think of no gentle way to ask, "Excuse me, but are my own wishes, plans, thoughts, or opinions of any interest to you at all?" There didn't seem to be a polite circumlocution for, "Who the hell do you think you are?"

Besides, I knew perfectly well who the hell he thought he was—and he was right. He was assuming my assent, not because I looked like some kind of patsy, but because nobody, weak or strong, ever said no to him. He assumed that I *wanted* to become him one day because everybody he knew did, because who would not? Jinny would never have taken up with me if I weren't sensible.

I heard a story once about a PreCollapse songwriter named Russell who'd written a song called "I'm Lost in the Woods," and because its melody sounded African, he decided he wanted a background chorus to sing the title in Zulu. But all the translators he found told him the same frustrating thing: there was no way to say "I'm lost in the woods" in Zulu. They didn't have that concept. Zulu didn't *get* lost in the woods. He had to settle for a chorus singing the Zulu for, "I am in the woods and I have gone crazy"

There was no sense even trying to tell this man, "I do not want to become infinitely rich and infinitely powerful"—it would come through as noise. When that pause in his flow of words finally came, he was going to hear whatever I said as, "I have gone crazy"

Well, if it didn't matter what he heard, then I could say whatever I liked; the only question was what I wanted to say. Ideally, something that would not make me cringe every time I remembered this day in years to come. Something that would not force me to lie when asked what I'd told the old buzzard then. Something respectful, but dignified; polite but firm.

As I worked on it, I became aware of distraction. I played back the last fifteen or twenty seconds and spotted a plausible cause: a few sentences ago, he had dropped a subtle remark that implied, without stating it explicitly, that he was sure I had figured out Jinny's real identity long ago . . . and that he applauded my good sense and good taste in continuing to play dumb for the sake of her feelings. It was annoyingly difficult to work out which of us he'd insulted worse—a distraction from the distraction.

But that wasn't even the distraction. Suddenly I realized what had really bothered me enough to try to demand my attention in the middle of an important conundrum—a problem far more urgent than an insult to me or a beloved I was thinking seriously of strangling.

I was on my *feet.* In motion. Walking toward the door.

Being walked toward the door, by Mr. Albert. His hand rested far too lightly on my shoulder to be steering me, exactly. But it did make it a little easier to keep going than to stop or turn around.

The conversation was over already. The insult I'd focused on had been part of some larger pattern of unnoticed sentences that had ended it, somehow. The pause I'd been waiting for, in which I could have my say, had simply never happened. Or had come and gone in an instant, while I was thinking of something else. It was too late, now. My choices were to keep on walking, or to make a scene. Albert had handled me as smoothly as an awards presenter getting the disoriented winner the hell offstage so they can get to the next, more important award.

I was angry at myself for having been outmaneuvered so effortlessly, for letting somebody march me around like a show dog with nothing more than a combination of body language cues, feather-gentle touch, and total confidence.

But I was also secretly grateful. I hadn't been looking forward to that pause. Now I could take as long as I liked to compose, refine, and polish my manifesto—and when it was ready, I could deliver it by e-mail, rather than face-to-face to the most powerful man on earth. Since I had done and said nothing, I had nothing to wish I could take back. Since no one was interested in my opinions, why bring them up? Especially since I had no clear idea what they were.

We reached the door, Albert said something or other, I made whatever was the appropriate response without thinking about it, and the door irised shut behind me.

Rennick was not waiting outside. Dorothy smiled as I came through the door and gave me a thumbs-up. I gave her what I thought was my very best sunny smile in reply, and she winced. "I—" I began, and stopped.

When she saw that I had no words, she stepped in smoothly "I enjoyed meeting you as well, Joel. Would you like Leo to guide you back to your room, or would you care to see some of the grounds, now? I don't believe you've had time for the tour, yet."

"Actually, I'd like to speak with Jinny," I said.

"I'm sorry, she's offsite at the moment. An errand for her father. She should be—"

"I'll phone her, then," I said, and lifted my wrist.

"We discourage phone calls to the outside, she said quickly. "It compromises security. She's due back before dinnertime, and I'll make sure she speaks with you the moment she's back inside the perimeter."

Right. "I see." Giving me time to calm down. "Very well, then. Thank you." It might just be a terrific idea to cool down a little before speaking to Jinny. Three or four years ought to do it.

"You're welcome. Would you like that tour of the grounds? It's quite—"

"Later, perhaps. Right now I'd like to go back to my room."

"Of course. Leo? Please guide Mr. Johnston back to his quarters."

"Yes, Dorothy." Green fireflies led me away. I followed them gratefully.

When I'd passed this way in the other direction, the corridors I'd walked through had seemed wastefully, ostentatiously large. Now they seemed cramped and claustrophobic. There was barely room for me, let alone for the billion thoughts swarming around my head, trying to gain entry. I wished mightily that I knew what I thought, how I felt, what I wanted, but I had the idea that I would not know any of those things for certain until I screamed them at Jinny. My mind kept trying to take refuge in disbelief that any of this was really happening. The trouble was, I knew my imagination just wasn't good enough to manufacture a hallucination like this.

I recognized, from the other direction, the intersection where I'd collided with little Evelyn earlier. I approached it with some caution, this time, listening carefully for someone swooping through the air on a skyboard. But of course I had no clear idea what, if anything, one sounded like. I eased up on the intersection, hooked one eye around the corner for a quick peek—

--nearly bumped noses with Evelyn.

She tried to keep a straight face, did pretty well for a few seconds, and then lost it. As soon as she did, I whooped with laughter myself. The tension release was welcome, almost too much so. I laughed a little bit harder than necessary for a little bit longer than I should have. She finished before I did.

Maybe it shook loose some brains. When I finally spoke, what I said surprised me. I expected to hear myself say something polite, banal, phony. What came out was, "Can you tell me how to get a cab around here?"

As I heard the words come out of my mouth I realized I very badly wanted to be away from here. To be back home. Alone. As quickly as possible. So I needed transportation. And I had no idea how to get any. And here before me, by happy chance, was about the only person in the entire compound, including Leo the AI, that I felt comfortable asking.

She just stared at me, unblinking.

"Transportation from here back to the Lower Mainland," I amplified. When she stared like that she looked remarkably like an owl.

"I came here in Jinny's car, but right now she's taken it offsite, and I need to get back home as soon as p . . . you're imitating an owl, aren't you?"

"I'm sorry," she said. "Yes, I was. I'll stop."

"Thanks. As I was s—"

"I'm not really sorry. But I'll pretend, as long as I don't have to do a very good job."

"Evelyn, honey—"

The owl lit up. "You remember my name."

"Look, I really need to—"

"Most grownups don't."

"Evelyn, how do—"

"You can't get a cab here, silly. There's no here."

I nodded. "I figured as much. But that implies there has to be some way to get guests where they need to go, when they need to be there. Do you know what it is?"

I nearly lost her with that question. Then her ferocious frown relaxed. "I deserved that. I was the one playing dumb. Yes, Joel, I do know. I'll help you."

I sighed. "Thank you, Ev. Will it take very long?"

"Is there anything in your room you have to go back for?" I thought about it and shook my head no.

"Follow me, then."

Three turns and perhaps a hundred meters later, she stopped, and touched a wall, and an elevator door opened up where not even a visible seam had been a moment ago. She touched the wall just beside the door, in a different way, and the wall developed a monitor and extruded a keypad—at a height convenient for a seven-year-old. She typed something on it, with only her index fingers, but at a speed that would have been remarkable even if she'd been using all ten. Finally she made a small grunt of satisfaction, and turned to me.

"You'll find a car waiting at ground level. Just state your destination; it'll find it."

"How do I—"

"When you get where you're going, just get out and say, 'Dismissed.' It homes."

Of course it did. I started for the elevator, then paused. "Ev, honey?"

"Yes, Joel?"

"Is this . . . I mean, are you going to get in trouble for this?" She grinned. "Not unless you rat me out."

"Are you sure?"

"Guest cars aren't a secret. Anybody could have called you one."

"But won't the record show that it was you who did?"

She grinned again. "The record says Jinny did."

I nodded. "Okay, then. Thank you. I owe you one." It didn't seem adequate. I bent, took her hand in mine, lifted it to my lips, and planted one just behind the knuckles. Then I straightened up and stepped into the elevator. "So long, Ev."

Her eyes were huge. "Hot jets."

"Clear skies." The door slid closed, and I rose rapidly enough to pull gee forces, reaching the surface in no time.

The car waiting for me there was generic, but much more luxurious—to the eye, at least—than the *faux* heap Jinny had driven me there in. The feature I found most praiseworthy was an exceedingly well-stocked bar. It contained the most expensive liquids, solids, vapors, sprayers, and essences then popular for the radical adjustment of attitude, mood, and energy. Being a poor student, from a frontier world with conservative customs, I was familiar with most of them only . . . well, academically—and about their synergistic effects in multiple combination I knew nothing whatsoever. I decided to remedy this deficiency by personal experiment. I attempted to try at least one of *everything,* and for all I know may have succeeded. I never noticed the takeoff, or indeed any of the trip, and I have no recollection of arrival back at my place.

I never did get my shoes back.

Five

Like the fabulous Conrad compound, my apartment was mostly underground, and did not appear on any map. But there the similarities ended. For one thing, it was not located in the middle of a glacier somewhere, but smack in the midst of some of the most densely populated land in the U.S.N.A., the White Rock district of Greater Vancouver. For another, it was the polar opposite of opulent or luxurious, as comfortable as a coffin. Vancouver itself has a tradition of quasilegal "basement suites" dating back centuries to some

World's Fair, or perhaps Olympics, but outlying suburbs like White Rock acquired theirs so recently that they're still illegal, hence unrecorded, hence unregulated, hence mostly shitholes. In sharp contrast to Conradville, it had only a single virtue to recommend it.

But right then, that virtue rated high in my scale of values. It was mine.

I take it back: it had one other thing going for it. The thing that had recommended it to me in the first place, back when I'd first grounded on Terra: like most caves, it was a terrific place to hole up. It had been my first refuge from the unbelievable crowding Terrans considered normal, from the appalling crime rate they considered acceptable, from my own sudden shocking physical weakness, from unexpectedly crushing homesickness and loneliness, and from my own unaccustomed social ineptitude. A womb with a view.

What I needed when I woke up, that horrible morning after, was refuge from my own thoughts and feelings. The apartment did its best, but I suspect a riot would have been insufficient distraction.

The emotion foremost in me when consciousness first reconstructed itself again was sadness, grief insupportable, but it took me a while to recall exactly what I was so sad about. Then it all came back in a rush, and I sat bolt upright in bed. My skull promptly exploded with the force of an antimatter collision—I'd obviously forgotten to take antihangover measures the night before—but the blinding white light and total agony seemed merely appropriate. I'd have howled like a dog if I'd had the strength. Instead I whimpered like a puppy.

For the last—I couldn't remember *how* many mornings, I had woken up thinking of Jinny. Yearning for Jinny. Aching for Jinny. Had woken every time from dreaming of Jinny—of us—of us together—of the distant but attainable day when she would be there in the morning, there all night, the day when I would finally possess her fully.

Possess her? Ha! My lifetime net worth would probably not suffice to lease an hour of her time.

And yet she wanted me.

And God help me, I still wanted her—as fiercely as ever. I could still have her, if I chose. So why was I so sad I wanted to fall out of bed and bang my face against the floor?

The sadness was because my dream was gone. Whatever the future might hold for me and Jinny, it would not, could not, remotely resemble anything I had ever envisioned. Conceivably it could be a better future, perhaps much better—but right now, at this remove, mostly what it was, was unimaginable.

Unless it was nothing at all. I could imagine that easily enough. I just didn't want to. Like life before I met Jinny—minus hope.

Let's not be hasty, Joel. I couldn't rent an hour of her time ... but I could have *all* of her hours, if I wanted, without paying a single credit. What *would* it cost me, though? Let's see. All my plans for my, our, future, for a start. The identity and goals and place in the world I had picked for myself. The rustic notion that the husband should be the one who supported the family, which I had already admitted to myself months ago was archaic nonsense anywhere but a frontier society like Ganymede. It hadn't been customary for the majority of the human race for well over a century now

And let's not forget one other little cost that Conrad had been quite upfront about: most of my waking hours for the rest of my days, which would be spent working very long and hard on things for which I had little interest, training, or talent. With the very best of medical care assuring that I'd be in harness as long as possible. I would have to assume and hear a yoke of almost inconceivable responsibility—responsibility to literally billions of people, all with their own loves and dreams and plans for their futures.

And even if I washed out personally, my children would be groomed and fitted and trained for that same responsibility from birth. All of them. In my vague eighteen-year-old imaginings of the children I might have one day, I had always pictured myself advising them to pursue whatever really interested them, to follow their hearts, the way my father had with me. That would no longer be an option if they were Conrads.

I'm making my hungover maunderings seem far more coherent and organized and cogent than they really were. At the very same time that all the thoughts I've just described were going through my head, for instance, I was also simultaneously asking myself over and over again just what, exactly, was so horrible about becoming one of the wealthiest and most powerful people in human history, if that was what it took to win the most beautiful woman in the Solar System?

Well, for a start, myself kept answering, you haven't *earned* it. What good is a prize, any prize, if you don't deserve it, if you haven't done the work? Face it, Joel: you don't even have the vaguest idea what the work *is.* To which my ongoing rebuttal was: Oh, give me a break, self. Do you *think* even Conrad of Conrad truly *earned* that much power and money? Do you think *anyone* could? Do you honestly believe any conceivable human being, however talented and however hardworking, could possibly *deserve* that much compensation, *merit* that much authority? The most anyone can do is *have* it. Old man Conrad happened to have been born from the right womb at the right time, and must have behaved thereafter more intelligently than any of his rivals, that was all. That was as close as he came to deserving what he had: it had been handed to him, and he had not fumbled it. Now it —or at least a piece of it—was being handed to me—or at least to my —children. Mine and Jinny's—

How could she do *this to me?*

Distraction. Distraction. Change the ch—ah, that was it. I found the remote—thank you, Mr. Tesla—turned on the tube, and selected passive entertainment, genre search.

First, drama: on some unimaginably distant colony planet—because there were two moons in the sky, one of them ringed—a beautiful woman with red hair was crying as if her heart were broken. No, thank you; *change* channel—

Comedy, next: a young man my age—we did make great natural comedic victims, didn't we?—had done something incredibly stupid, and a roomful of people and Martians were laughing openly at his humiliation. Next, please—

Erotica. I was utterly disinterested, and noticed that my right arm was extremely weary. Apparently that car's drug supply had included libido enhancers. Next—

Sports. Free-fall soccer semifinals, O'Neill versus the Belt, winner to face Circum-Terra in the fall. As it came on, the mob outside the globe roared: a forward as long and lean as a Ganymedean had just frozen, fumbled his chance, blown an easy shot by hesitating. Zoom in for extreme closeup of his anguished features, his obvious shame. Next —

News, Systemwide: Luna Free State was saying very rude things about Ganymede's trade policy, and Terra was making no comment; while nobody had actually used the words "trade war" yet, everyone was thinking them, louder than they had last week. And here I was, trapped at the bottom of the gravity well. Next—

News, Global: The outfitting and provisioning of the latest colony ship, RSS *Charles Sheffield,* was nearly complete. It was expected to leave orbit in a few days, and a few days after that, assuming its drive lit without incident, its complement of some five hundred souls should go bye-bye in a big hurry. Hopefully to a star called Immega 714—known also, for reasons I could not imagine, as "Peekaboo." Only the day before yesterday, I had considered most of them to be idiots, a company of mist its, malcontents, romantics, failures, crackpot visionaries, runaways, transportees, and other defective personalities. Now I found myself fiercely envying them. Just a couple more days, and nothing the Conrad dynasty or any individual Conrad could possibly do would ever again affect them in the slightest. What dominated my future and my children's future was shortly to become as irrelevant to them as the Roman Empire. Sigh. Next—

Local news. Housing riots again. This time the demonstrators had somehow overwhelmed or outsmarted both proctors and private security, and penetrated to the very heart of Vancouver's most upscale neighborhood, the tony intersection of Main and Hastings. Standard anticrowd measures could not be taken for fear of excessive damage to private property.

I switched to the fiction channel, scanned my favorites index for a story I wanted to reread, something really good and solid and dependable—and long, at least a trilogy. As I did, random sentences from old favorite books kept running through my head. You don't turn down a promotion . . . if someone puts money in your hand, close your fingers and keep your mouth shut ... let this cup pass from me . . . he played the hand he was dealt ... opporknockity tunes but once, and you'd better be in tune with it. . . .

Forget fiction. I was way too scattered to read. Even focusing on titles was beyond me. I didn't bother with any of the music channels: I just knew that whatever I got would be heartbreaking. I shut the screen altogether and flung the remote across the room.

God damn it, how could she do *this to me?*

How could she lie to me that way, hide the truth from me for so long, tell so many lies to me, play me for a fool? My innocent, loving maiden turned out to be a slumming aristocrat, Harun al-Rashid's granddaughter in clever disguise, casing the marketplace for a strapping young peasant lad with acceptable features and good teeth, to serve as stud back at the palace . . . smiling fondly inside at his earnest naiveté and childish dreams. . . .

Again, rebuttal wrote itself. Joel, don't be a nincompoop. *How could she* not *have done this to you?* How would you have handled her problem differently, in her place? Placed an ad on the Web? "Princess seeks hybrid vigor. Salary effectively infinite. Auditions daily at noon; bring resume, genotype, and headshot."

Me: Well, no, but—

Myself: But what? Once you did catch her eye, once she did somehow, for some glorious reason, cut you out of the herd and let you sniff each other, what was she supposed to do? Tell you who she really was on the first date? Come, now—

Me: But she could have! It wouldn't have—

Myself: Oh, please. In the first place you're full of shit, and in the second place even if you're not, even if you really happen to be the kind of unique and special human being who isn't remotely fazed by small things like unimaginable wealth and power . . . *how the hell was she supposed to* know *that on a* first *date?* Or a twentieth?

Me: She kept the damn masquerade up a lot longer than twenty dates! She strung me along for—

Myself: She maintained her cover until about thirty seconds after you stated for the first time, unequivocally and with sincerity in your voice, that you wanted to marry her as soon as you were able.

Me: . . .

Myself: You tell me: can you think of any other way at all that a girl in her position could know, for certain, whether she's loved for her self or for her pelf? A girl needs to know these things, pal.

I: He's right, you know.

Me: Yes, but—

Myself: Wait, I'm not done. Can you think of any other way at all that a guy in your position could know, for certain, that he genuinely loves a girl who's worth gigacredits? Isn't that a good thing for the guy to know before he marries her?

I: You'll never have any doubts about your own motives, now.

Myself: And neither will she.

Imaginary friend, kibitzing: And neither will anybody else. Everyone will know the story: face it, it's too good not to tell.

Me: Spiffing. Everyone I ever meet will be thinking, how smart can he be, to have been so profoundly fooled for so long.

Myself: If they know the story, *they'll* know Jinny. They'll understand.

Me: Okay, good point. Only . . . only . . . it's just . . . it's ...

Damn it out to the Oort Cloud and back, I understood why she had to do what she did—but *how could she do that to me?*

Distraction. Distraction.

I found that I was on my feet, dressed, and pacing around my tiny apartment, with no memory of having willed any of these things. This suggested to me that the distraction should take the form of a depressant rather than a stimulant.

The bar in my home was a pathetic joke compared to even the field model in Conrad's guest taxi—I was a starving student, who couldn't afford to indulge, and usually didn't mind—but its sole useful content happened to be a large, unopened bottle of an ancient Greek alcoholic beverage called Metaxa, a species of brandy, given to me by a friend with family on Ikaros. I pulled the cork, decided to dispense with a glass, took a big incautious gulp. It smelled and tasted the way I have always imagined gasoline must have smelled and tasted—especially if the gasoline were on fire at the time. By the time I realized my error and tried to scream, my vocal cords were crisped. My tongue cooked through as if microwaved. Tears spilled like lava from my boiling eyes.

When I could see again, I located my arm, followed it to my hand. The bottle was still in it. I transferred my consciousness, became the bottle, managed to locate my former mouth, and made my way back there. But in attempting to make the jump back to my own brain again, in order to appreciate the full benefit of that second swallow I got lost somehow I thrashed around the noosphere for a while, looking for me, but eventually I decided the hell with it and just embraced the darkness. Darkness was a very good thing to embrace. You could count on it staying what it was.

After that comes a series of disconnected fragmentary memories, of events so unlikely and actions so unlike me I'm honestly not sure whether they were real, hallucinations, or some combination thereof.

I'm quite prepared to believe, for instance, that at one point I raced up the Granville Street Slidewalk, scattering pedestrians like duckpins, while screaming, "I am Prorad of Prorad! Absolutely nothing that happens to you is my fault!" But can it be remotely possible that I really was, as memory insists, holding hands with a monkey at the time? Where did the monkey come from? Where did he go?

Similarly, it's not impossible that I challenged half a dozen White Hat boys to personal combat for laughing at me in Chinatown. The Granville Slidewalk leads in that direction, and I was in a suicidal mood. But how I could have survived . . . whatever ensued . . . unscathed, I can neither recall nor imagine. I had no weapon, no combat skills, and Ganymedean muscles. (I never understood, by the way, why Chinatown was still called that, considering that it had been well over a century since the population of Greater Vancouver was less than sixty percent Chinese by ethnicity. I don't know; maybe ghettoization becomes funny after it stops happening. Or perhaps it was more of a "Never forget!" thing.)

And if I was in Chinatown, on foot—I had no money for cabs or other public transport—how could I have found myself, an eyeblink later, all the way across town at Spanish Banks beach, watching the vast boat city moored there, Little Kong, gleam in the sunlight, and boil and bustle with the indomitable industry of the doomed? As far as I could see, they were selling seawater to each other out there—but they did it with all their might, each dreaming of cornering the market one day. When a few Vietnamese came ashore, I reeled over and tried to apologize to them, for not having the guts to become a Conrad, and thus solve the politico-economic conditions that trapped them there. But the language barrier intervened—they spoke no Basic, I spoke no Vietnamese—and somehow I ended up buying an unlabeled sprayer of something even more diabolical than Metaxa from them, instead. Maybe they did understand what I was trying to say, after all.

I remember the first rush of it, whatever it was—it was memorable, even to a man in my condition—and after that I have only one other brief scrap of memory that seems even remotely likely to be real.

I became aware that I was chilly. This rekindled enough awareness for me to notice that I was on the west side of Stanley Park—halfway up a *tall* tree. (How did I get to the Park from Spanish Banks on foot? Persuade someone to drive me? Stow away on a bus? Teleport? No idea.)

It seems clear in retrospect that my intention must have been to commit suicide. Ganymedeans do not climb tall trees in Terran gravity for any other reason I can think of. Amazing I got as far as halfway up; I had never climbed a tree in my life. Apparently I had become distracted by the magnificent view, staring across the Georgia Strait at distant Vancouver Island, just visible low on the horizon, and beyond that the Juan de Fuca Strait and the Pacific Ocean and ultimately Vladivostok, I suppose.

I should not have been chilly—I don't wear stupid clothes—but I'd obviously forgotten to recharge them. It made sense that my face would he the chilliest part of me . . . but why was the coolness there *moving,* running down toward my neck? I had just worked out that it was tears, sheets of them, when my phone went off. I knew who it was, but checked the display anyway, just on the off chance that it was a major university offering me a full scholarship and bursaries.

It was Jinny, of course.

I turned up the volume to hear the message she was recording. "—been trying to give you room, give you time to get ov—uh, to adjust to the situation. I know I've given you a lot to deal with. I understand why you ran away. But I can't wait anymore, I'm going out of my mind. Pick up, Joel, we have to talk. *Please* pick up. I probably won't be able to call you again, and if you try and call me back, it won't . . . oh, God damn it, I love you, Joel. I really do. You know that. Just give me—"

I plucked the earbeads out of my ears, held them at arm's length. Jinny's voice became a faint cricket sound. That seemed a distinct improvement. If a little was good, then—I threw the earbeads so hard, they cleared the sea wall below and plunked into the Georgia Strait. Yes, that was the ticket: no more cricket.

" 'Ran away'?" I muttered. *"I'll* show you run away, lady. Watch me."

How did I get back down from that tree without breaking anything? I reject memory, which says I was assisted by a team of swans, but have no better explanation to offer.

There are, as I said, a few more shards of memory after that, but I don't think any of them represent real experiences. I don't think, for instance, that it's possible to *do* that with even an *extremely* cooperative goat. Certainly not without paying in advance.

And then, with the shocking suddenness of running full tilt into an unseen wall, I was instantly a hundred percent cold sober, and an ugly man with lemon breath was staring into my eyes from no more than ten or twenty centimeters away, so fixedly and intently that I sensed he was grading them, by some unknown criteria.

I couldn't stop him, so I decided to grade his eyes. At first they seemed the eyes of a man so tired he was on the verge of a temper tantrum. But on second look I could see that he was always that angry, and the fatigue merely blew his cover. On the third look, I learned something new. Until then I had believed that anger is *always* fear in disguise. My father had told me so once, in memorable circumstances, and I'd never seen a counterexample. But now I could see that at least some of this man's anger derived not from fear, but from shame. In some way he had failed himself irredeemably—so irredeemably that there was no longer anything left to fear. His face tried to say that was *my* fault, especially his mouth—but his eyes knew damn well it wasn't.

"Am I finally addressing a sentient being?" he asked.

Early sixties. Ruddy face. Strong lemon breath. Sour lemon. "I doubt it," I said. "But I'm probably close enough to run for Parliament, at least."

He grunted and moved away. As his face receded I tried to follow it and fell off my chair, thereby learning that I had been sitting in a chair. Where this chair, *mein* herr? There, *mon cher.* Well, I swear.

He let me make my own way back up into the chair, leaning into the force of his contempt as if it were a strong wind. It took me a while. Before I had time to congratulate myself, he said, "I'm Dr. Rivera. Do you know where you are?"

I rubbed a sore spot on my face. "On Terra, obviously. Barbaric gravity."

He didn't have the energy to be impatient. "Where on Terra, specifically?"

"In these pants," I said, and giggled.

"After what I gave you, you should be straight by now," he said. "I conclude you must be a natural horse's ass."

"Nonsense! I've had to work hard at it."

Humor was wasted on him. Or being wasted was not humorous to him. One of those. "You are in Tampa, Florida."

I giggled again. "Home of the tampon. Is this your pad?"

"You are at the Tampa Spaceport."

"You don't want to Tampa with a spaceport. Your complexion could end up even Florider." I cracked myself up with that one. But as I laughed, rusty wheels finally began to turn slowly in my head.

Tampa? Why the hell would I go to Tampa? Even if I had found some sort of pressing reason to visit a spaceport, Albuquerque was a hell of a lot closer to Vancouver than Tampa was—

"Do you know why you are—"

What did Tampa have that Albuquerque didn't? Nothing. In fact, these days Tampa was almost completely closed to normal commercial traffic, due to—something. I forgot.

"I said, do you even remember what you—"

What made Tampa different from any other spaceport in this hemisphere?

"Forget it," he said suddenly. "You're not up to this."

"The hell I'm not," I said automatically. Whatever he was talking about, who the hell was he to be talking about it?

His contempt reached a crescendo. "Young man, I doubt you'd be up to it even if your bloodstream were completely clean. It's a big decision. Too big for you. Try again another time. You probably won't be any smarter, but you will at least be older."

Wait a minute, now—there *was* one thing you could do at Tampa that you couldn't do at any other spaceport in this hemisphere, right at this time—

"I'm old enough to make up my own mind, Dr. Rivera," I snapped.

—wait a minute—

He blinked. "See here, son—you are indeed, as you point out, legally old enough to make up your mind as neat and tight and tidy as your bed used to be made up when you lived with your mother. But *you have not done so yet.* Half your blankets are on the floor, the sheets are a tangled wreck. Go sleep it off, come back in a day or two, and we'll talk. In my professional judgment, you're not ready to go to Immega 714."

My jaw fell. On my first attempt, I had very nearly gotten stoned enough to fall right out of the Solar System.

When the shock wore off, I found I was more than half tempted to go *through* with it. Sign onto the *Sheffield,* become a Gentleman Adventurer, and head for the stars. Partly just to spite that sourpuss with the sour lemon breath, for telling me I couldn't. But mostly because it suited my mood. Star travel would certainly be a way out of the trap I'd put myself in, the trap Jinny had led me into—

--one that involved gnawing off both my own legs. No thanks. I told Lemon-Breath Rivera I *would* be back in a day or two, but we both knew I was fronting. I found myself on the street, blinking against the Tampa sunshine, sweating in the Tampa heat.

I considered various options for getting home again, balancing speed against expense with the miserliness of a student on a short budget. Then I thought to consult my credit balance, and my options shrank to one. If that. In choosing my route to Tampa, I had apparently assumed it was okay to burn bridges, and had chosen a semiballistic. Fast, comfortable—and very expensive, what with the price of hydrogen. I was just short of totally tapped out.

I consulted an atlas, and calculated that with a little luck, the highspeed public slidewalks ought to get me back to Vancouver in no more than seventeen hours or so. If I could just avoid getting hungry or thirsty or bored for that long, I'd end up back in my tiny basement apartment, free to gorge on whatever I had left in the pantry and all the water I wanted, while enjoying any book or film I already owned. Then I would have to start praying that my scholarship came through before the next rent payment was due. This was a bad time to go into debt; interest rates were approaching body temperature.

I made a mental note: *never* go on a bender without taping a fifty-credit bill to the sole of your foot.

I found slidewalk access without too much trouble, transferred my way up to the 320 kph strip in due course, found a seat without difficulty, and hunkered down for the trip. It took me all of half an hour to go from terminal nausea to ravening hunger. Did you know that you smell at least partially with your mouth? Holding my nose didn't help nearly enough in suppressing food smells. I had to keep resisting a temptation to suck on my own hand. I was already drawing enough unwanted attention as it was: it turned out that I *looked* like someone on a bender. Why wouldn't I?

After a lonely half hour I spent watching countryside whip past too fast to really see, someone sat down near me. That cheered me up until I realized the reason for his tolerance: he was well into a bender of his own, and might not have noticed if I'd been on fire. Ignoring public privacy laws, he was listening to music on speaker rather than his earbeads. I started to object—and got sucker-punched by the song that was emanating from his wrist.

It's the reason we came from the mud, don't you know
'cause we wanted to climb to the stars

Instantly, I was back in the ballroom of the Hotel Vancouver, in Jinny's arms, dancing with her at our prom. The last happy moment I could recall. Maybe the last one I was ever going to have. I know that sounds melodramatic, hut that's because you're not eighteen anymore. I didn't burst into tears—quite. But it was a near thing.

Ask anyone which way is God, and you know
he will probably point to the stars ...

Not everyone, I thought. Some of us would point to a glacier somewhere in northern British Columbia.

All at once I understood the real reason I had chosen not to hop a starship after all. I wasn't *done* yet. I couldn't even think about *thinking about* leaving for Immega 714 as long as my situation was still unresolved. Not until I'd done everything I could to try and fix it. I was still alive. Jinny was still alive.

Well, there was no time like the present. Automatically, I started to look round for a 'fresher, to fix my appearance—then decided it could wait. Let Jinny see the state she'd reduced me to, first. All I wanted from her right now was a phone code, anyway. *Then* I'd get cleaned up. She and I would have our own conversation, after this upcoming one was done. I punched her code from memory—my own, I mean, not pod storage—and then the call went through, and

I flipped my wrist over to make the screen go away and shouted

"Coventry!" loud enough to startle my zoned neighbour into muting his music.

Why was I so surprised? *Ask me which way is God,* I thought, *and I'll point to my phone.*

I turned my wrist back over, and Conrad of Conrad frowned up at me.

I had *wanted* to talk to him, planned to talk to him, with great firmness and determination. In a few minutes, once I'd gotten his code from Jinny and prepared my lines. Now I was off balance. Great start.

He began speaking nearly at once. I could see his lips move. But I was now forcibly reminded that I had thrown my earbeads into the Georgia Strait, last night. I could only point at my ears and shake my head, feeling like an idiot, even further off balance.

He glanced way offscreen at someone to his right, lifted an eyebrow, and my phone put itself on speaker. I'd have thought of it myself in a second. I could feel my cheeks burning.

"I said, I understand your problem, Joel."

I hoped to call myself a man one day. It simply did not matter it I was unprepared, or my hair was uncombed, or my pants were on. Showtime! "I'm very glad to hear that, Conrad." There now—I'd remembered in time not to call him "sir."

"You have grave doubts that you'll measure up." I tried to respond, and he kept talking right over me until I stopped. "Any sane man in your position would. You have no life experience to reassure you yet. Or to reassure me, for that matter. Women's intuition has historically been a chancy method of selecting winners—else Troy would still stand. But your genes and grades are excellent, for what that's worth. And you have offplanet experience, which broadens a man. Maybe you are what we need. I think you are. In any case you are going to be given a chance. One moment, Joel."

His gaze shifted up and to his left slightly, and he began a conversation with someone in a corner of his screen. The audio cut off, and the image of his mouth fuzzed so that his lips could not be read. Very slick.

I used the pause to get hold of myself, control my breath, and figure out what to say to cure his misconceptions. I even had a second or two to appreciate the surreality of having a phone conversation on a public slidewalk with one of the wealthiest living humans. Then I waited to seize control of the conversation the moment his eyes returned to mine.

Waste of time; once again he simply ignored the fact that I was speaking. "If you do measure up, you will become a Conrad, with all that implies. If you don't—well, you and your children will be

Johnstons, but considerably better off than you would otherwise be. One of the pleasant things about this dynasty is that we can be liberal in pensioning off those who don't quite make it." I'd have tried to interrupt if there'd been any point. "If you turned out to have no real head for business but were tops in research, say, you might end up as Dr. Johnston, Chief of Kindelberger Research Laboratories. Or you might choose to simply lie in the sun in Cairns, and that can be arranged, too—we can afford to be generous. One moment."

Once again he spoke briefly and inaudibly with someone else, this time in his lower righthand corner. This time when his gaze returned to me I was ready with a very loud, "Mr. Conrad, sir!"

I think he literally didn't know how to process insolence. Insufficient experience. It shut him up long enough for me to wedge four more words in edgewise. It took a surprising amount of courage to say them.

"The answer is no."

He tried to frown and raise his eyebrows in surprise at the same time. Even Conrad of Conrad must have heard those words before—or he'd own *everything,* instead of only about a quarter of it. But he clearly hadn't expected to hear them now, from me. "You mean you *don't want* to marry my granddaughter?"

Surprising him cheered me up. I reminded myself that I had once bitten this man. Hard, as I recalled. "Don't misunderstand me. If Jinny wants to get married right away, we'll get married. I'll swing it somehow. But I do not intend to let someone else lay out my life according to some kind of time table and tell me when to wipe my nose—no matter how well the job pays. It's not a question of measuring up. I'll do my own measuring. And I'll pay my own way. Thanks anyway, I appreciate it, I do appreciate it—but keep your free lunch, it's not for me."

He glanced up and to the right, and this time forgot to mute his audio. "Tell the Secretary of State I will be a few minutes late." I think he really did forget, because when he said those words his voice was flat and cold, and when he turned back to me it had become warm and fatherly "I admire spirit in a young man, I really do. We can't hold this thing together with yes-men and flunkies at the top. Your answer convinces me more than anything else that little Jinnia Anne has made a wise choice. Nevertheless, I must convince *you* that we need you—and that you need training. We've got to crowd thirty years of training into the next ten—it's been proved over and over again that, despite the wonders of modern geriatrics, young men must be allowed to make top decisions before age, experience, and caution grow on them like rust or mold. We must strive for a young man's drive and an old man's knowledge. Not easy." He sighed. "And the young have all the time in the world. I wish I did. You want to sleep on it, I can see that. Looks like you could use the sleep, too." Without taking his eyes from mine, he told someone, "Joel will call me at this code tomorrow at 0900 PST."

I started to ask him what code to use to reach Jinny—but he had already broken the connection.

I tried redialing the number—and was told it was a null. I could guess it would remain one, at least for me, until tomorrow morning at nine.

I went to Jinny's apartment that night. She had moved out. No forwarding address. I caught one of her neighbors looking at me with pity. I agreed with her.

I did not call Conrad at 0900 the next morning. For the next half hour, I was braced for him to call me, or have some flunky summon me, but he did not. For the rest of the morning, I was halfway prepared for two large men to bust in my door and drag me out to a black limo, but nothing of the sort occurred.

A little after noon, there was incoming mail, a text-only message. It was a letter from Stony Brook, informing me without even a polite pretense of regret that my scholarship had been turned down. It didn't say why, but it didn't need to.

Every single plan I had made for my life lay in ruins. No degree, no career, no future, no Jinny, no family—unless I consented to serve at stud while training to run a multiplanet dynasty. My only two lifestyle choices were to be a dole bludger, or one of the wealthiest gigolos alive.

I wanted, very badly, to get so wasted that my previous bender would seem a mere preamble.

Instead, I did not so much as drink a beer or take an acetaminophen.

I spent the day taking care of a number of tedious details and formalities.

I ate a healthy dinner, retired early, got a good night's sleep. In the morning, I filled a backpack with the belongings and food I hadn't disposed of the day before, locked the apartment behind me for the last time, and headed for a crosstown slidewalk.

A little over seventeen hours later I persuaded Dr. Rivera (whose breath smelled like strawberries that day) that I was sober enough to apply for a slot on the waiting list for a berth on the RSS *Sheffield.* The expedition's backers had no connection whatsoever with the Conrad dynasty; my application was accepted. That very afternoon, one of the colonists who'd already been accepted managed to kill himself on one last rock-climbing trip. The next day I was informed that I had been chosen to replace him.

I was on my way to Immega 714, aka Peekaboo. Where I would live out my life on the planet called Brasil Novo.

Six

There is no wealth but life.
—John Ruskin

There were other candidates, of course, some of whom had been waiting *years* longer than I had, and a great many of them had more impressive skill sets or resources than I did, as well. But such decisions are rarely made fairly. What got me the berth—late starter, dead broke, and all—was a combination of three specific unfair advantages I had over my competitors.

First, of course, was what would have been a disadvantage in just about any other enterprise, with the possible exception of prostitution: my extreme youth. I had only just become a legal adult. You want young people on a voyage expected to last nearly twenty years, ship time, and over ninety years Earth time—but not a lot of them volunteer for such a trip. If they do, and are turned down, they tend to go away and make another plan. It's not really the sort of trip young people sit around and pine for, at least not now that the first waves have gone. Not happy healthy ones, anyway.

The next important factor was sheer coincidence: the *Sheffield's* boost rate. She would blast at a constant acceleration of exactly one-third gee—and I was from Ganymede. I'd be one of the few around who felt normal, for a change. For once, I'd be markedly better adapted, *more* effective, than those I was with. Even fewer Ganymedeans or Marsmen tended to sign up for star travel than did teenagers; they were just too busy.

But what cinched the deal was, I was from Ganymede. That is, I was one of no more than a handful of star colonists who had any practical, hands-on experience whatsoever with . . . pause for ironic drumroll ... dirt farming!

You can't blame Earthlings for not knowing much about that: despite what they named their planet, really good dirt is getting hard to come by, there. (God knows the Prophet wasted enough of it for them, may his concept of Hell actually appear, for just long enough to accept him.) But most Terrans haven't even done any *hydroponic* farming, and the few who have are generally too rich to make good candidates for interstellar refugees. There is something to be said for scarcity. The total food-growing experience of most *Sheffield* passengers was almost indistinguishable from zero.

And I had a *ton* of it. Not theoretical experience, either. Not classroom knowledge, but the kind where bilging the course means you starve. Like most Ganymedeans, and many colonials in or on other worlds, I had spent a portion of my childhood turning earth, hauling manure, outguessing weather, making crops—performing some of the most ancient labor there is, using tools so primitive by Terrestrial standards that most of my fellow colonists probably could not have identified them without help. That's what we were all so *busy* at, up there, if you've been wondering: turning rock into rutabagas, because they tasted better, and were also more nutritious.

Go ahead, laugh—I did. The one aspect of my background that had always been guaranteed to elicit gales of laughter from those Terrans I admitted it to ended up being the deciding factor in sending me to the stars. Pretty good joke, even for fate.

Even those three factors might not have been enough to get me aboard one of the very earliest colony ships—the *Gaia,* say—not at the last minute. For the first dozen voyages or so, crew and colonists alike were minutely scrutinized, rigorously tested, and meticulously matched according to carefully worked out social, psychological, and ergonomic principles (it says here), with hopeful alternates ready to fill a last-minute opening in any niche, long before the ship was ready to boost.

But by now, almost two dozen ships had left the Solar System—and the supply of applicants was beginning to thin out just a little.

Correction: the *cream* was beginning to thin out a little. There was still a copious supply of applicants . . . 99.99 percent of whom were eliminated by gross tests. Half the remainder then changed their minds halfway through.

Part of the problem was, hardly anybody still left *wanted* to pioneer, wanted to leave everything and everybody behind forever, and go plant beans by the sweat of their back under the miscolored light of an alien sun. It wasn't really a question of pioneer spirit being just about gone, as jeremiahs were always complaining on the wire. Even way back in history, so-called pioneer spirit was usually the result of intolerable conditions back home more than anything else.

That applied back at the very dawn of star travel. Volunteers to leave the Prophet's Paradise were not hard to come by. But the Solar System was a fairly tolerable habitat for most people about now, particularly Terrans and O'Neillers. There was still plenty of frontier to go around, too, for those who hated crowds and regulations. The Asteroid Belt seemed unlikely to fill up anytime soon. To want to leave Sol altogether, forever, you almost had to be a born misfit, or a perpetual tourist, or as brave and curious as a bodhisattva. Most of the last category had signed up already and left in the first or second wave.

I've omitted two other historically significant categories of pioneer. Fortunately, things had not yet reached the point where colony planners willingly accepted members of the first category: perpetual fuckups. But this *would* be the third ship so far to carry transportees—prisoners, guaranteed by their various sentencing jurisdictions to be "nonviolent," "suitably skilled," "highly motivated" "volunteers." But there would be just over two dozen of them, five percent of the colony's total population, and the majority would be political prisoners rather than predators. Neither of the previous transportee experiments had sent back reports of any problems so far.

One other thing I've speculated about. I said that the Immega 714 colony's underwriters were not allied with the Conrads. In fact, they were instead associated with the Kangs and the da Costas, both houses that were hereditary enemies of the Conrads. The RSS Sheffield's designers, the prestigious firm of Ray, Guy and Douglas, belonged to neither house—but were all notorious defectors from the giant Conrad subsidiary Starship Enterprises MDA.

I knew nothing of the history between the three houses, and still don't—but sometimes I wonder whether a deep enough background check on me mightn't have turned up the information that the Conrad family had put the Black Spot on me ... and why. Are relationships between financial empires really petty enough that some Chinese or Brazilian exec way beyond his Peter Principle point might have upchecked my application purely to spite Richard Conrad?

I don't know. Do you?

I expected something like a vocational/educational boot camp on the ground—several rigorous weeks at least of cramming, training, testing, observation, evaluation, and ultimately final placement in my proper place on the great ship's table of organization.

I didn't even get orientation indoctrination. They called me at a little after 7:00 A.M. Pacific Standard Time in White Rock—near the end of business hours in Brussels, where the decision had been made—to tell me I'd been selected to take passage on the *Sheffield.* By nine that night, Pacific time, I was aboard her.

Where it was 6:00 A.M. local ship's time, since the *Sheffield* was using the same Central European Time that Brussels did, for reasons left as an exercise for the reader who likes easy lifting.

I emerged from the airlock braced, I thought, for a barrage of new sensory data and impressions, expecting the unexpected insofar as that phrase has any meaning. Which is not much: I was definitely sideswiped by the smell.

It's possible to cut your nose out of your breathing circuit completely, and I did at once. But that aroma was just pungent enough to taste with the tongue, and there's no bypass for *that,* short of tracheotomy. I'd have stopped in my tracks . . . if I had not been so busy bracing my brain for new impressions that I'd neglected to have the more useful portion of my body maintain a hold on the airlock door. Having thus committed myself, I kept on sailing forward, with the stately inevitable grace of a runaway hospital bed on ice, until I crashed into a naked bald man.

I'm a colonial. We maintain some conservative (public) attitudes about sexuality, by contemporary System standards, but at the same time, being on the frontier we tend to be somewhat more practical and matter-of-fact than most Earthlings are about nudity. It was the bald part that startled me.

Thanks to the unnamed ladies who did us all the favor of tearing the Prophet into little bloody gobbets and bits of bone, it is finally once again permissible to do biological research, so happily all baldness is voluntary today, and is not a popular choice. And extremes of body weight are becoming so rare, one body looks much like another from a distance nowadays—so why would a man who spent time nude choose to shave off his only visual identifier? Was he antisocial? Or just self-effacing?

Neither. "I know exactly what you're thinking," he said, and managed to brake us to a halt without sending either of us drifting. His speaking voice was just audible, despite our proximity.

I became aware that I was holding him in something very like a lover's four-limbed embrace, and forced myself not to flinch. I was the stranger here, he was my host. But I hoped our sexual orientations matched. "So?"

He let go of me, again without setting me adrift. His expression was no clue at all. "You're thinking, if it smells like this after only a few months of occupancy, what is it going to smell like in twenty years?"

I had to admit I had been on the way to formulating that very thought when I'd crashed. "Right in one."

"And the answer is, in far less than twenty years you will be prepared to swear, truthfully, that this ship has no smell at all, other than local cooking and your wife's perfume." Once again, his voice was just barely as loud as it needed to be.

I wasn't convinced. But I didn't need to be. "What is it I'm smelling, exactly?"

"Us," he said simply.

I tentatively half opened a nostril, and frowned. "I know what people smell like, what a ship smells like, and there's more than that here."

"You know what Ganymedeans smell like, and Terrans in a limited portion of a third of its northern hemisphere. This isn't just *everybody,* it's everybody all *together.* And more of 'em than you've ever been shut in with before. Terrans from all over that varied planet, Loonies, O'Neillers, Martians, Ganymedeans, Belters—all at the same time, in combination. Fewer than two dozen times in history have all those smells been mingled, in large amounts—and the other ones have left the Solar System already"

"Oh."

"No one group's smell is intrinsically better or worse than any others', and you might very well find the personal body odor of an individual from just about any racial, political, or social group aboard perfectly agreeable to you. But put them *all* together, in one place, and ancient instinct makes you uneasy. Think of it as one of the last remaining traces of our physical predisposition to xenophobia and racism. Like the appendix."

I had never seen anybody real talk for so long without even momentarily developing a facial expression. "I hope you're right," I said politely.

"Also, the two decks immediately above this one are both agricultural decks. We're sort of in the bilge of Noah's Ark here."

"I apologize for crashing into you."

He shook his head—slowly, the way one does in free fall. "All you did was fail to realize you would need someone to catch you, and that was so close to inevitable that I was waiting there specifically to catch you. Shuttles are always overpressured: *everyone* comes sailing in the door. Apology respectfully returned unopened."

I shook my own head even slower, to underline the point I was about to make. "You don't understand. I was *born* in free fall. I could at least have docked more gracefully"

He nodded, even more slowly. Was that a twinkle in his eye? Or a tic? "Ah," he said. "In that case, you *are* a dimwit. And an oaf. But you can't help being either one; so apology is still unnecessary. Come with me, please."

And as I gaped, he turned over, grabbed a rung on the wall with one hand, and jaunted off down the corridor, at a pace suitable for dimwits and oafs.

In my embarrassment, I nearly mortified myself completely by bleating out "Wait!" like some fool groundhog. To say "wait" to someone who has just jaunted away from you in zero gee is basically as sensible as saying it to someone who just stepped off a roof: barring unreasonable effort, they're *gone.* Barely in time, I managed to end the "W—" with "—hat about my luggage?"

"You'll never see it again," he called back without turning around, just loud enough to be understood, and continued to drift away.

I realized to my dismay he had left me stationary. That's not supposed to be possible in free fall, and I suppose technically I must have had some sort of vector, but I could see it wasn't going to close the half-meter gap between me and the corridor wall anytime soon. I had no thrusters, or even wings.

It turns out you *can* swim in air, if it's thick enough. But not well at *all,* and definitely not without looking like a dimwit and an oaf. By the time I got one hand on a rung, he had receded so far there was great temptation to complete my disgraceful display by flinging myself after him too hard, the classic newbie mistake. Instead I carefully set a measured pace, just faster than his own, and settled back to—

He stuck out his arm as if signaling a turn, grabbed a rung—zip—made an abrupt turn in the direction I was falling right at the moment, and disappeared.

When there's nothing else you can do, breathe slower. There's no way it can hurt, and it might help. Long before I reached that rung which I had failed to spot as larger than the rest and therefore a corner rung, I had calmed down enough to find at least a few small items to place in the This-Might-Not-Be-So-Bad column.

If it was possible to swim in air *at all,* then the air pressure in this dump was considerably better than that in the low-budget liners and the one military vessel I'd previously traveled aboard. Which explained why smells were more pungent than I'd expected . . . but also promised that the food was going to *taste* as good as it did on Terra. Presuming, that is, that it started out that tasty.

If you've never experienced anything other than Terran normal pressure, I may need to explain that. Most Terrans don't seem to realize more than half of what they think of as their sense of taste is actually their sense of smell. This confusion becomes clear the first time you eat something you like in lower pressure. Federation military standard pressure is just barely good enough to appreciate superb coffee. Aboard an economy liner everything pretty much tastes like varying consistencies of warm cardboard or tinted water, and you can chew Red Savina habarieros. (Half a million Scoville units.) Economy passage on a luxury liner, I'm told, gets you warm spiced cardboard and *flavored* water. I had tolerated both ends of that spectrum, without too much difficulty—

—for the length of an Outer to Inner System hop, most conveniently measured in weeks! Twenty years was going to be a decidedly different matter. It was nice to know I would not spend my first weeks on Brasil Novo weeping with joy at the rediscovery of garlic—of any spice subtler than Scotch bonnet peppers. (A mere third of a million Scovilles, tops.)

Very nice, really. I conceded to myself as I jaunted along that I was in rocky emotional shape, and in need of consolation. And my father had once told me nothing consoles humans like gratifying our appetites. And a good half of my own total appetites were of no further use to me—I was done with women, for good and for all time. Food, music, and good books had damn well better be enough to fill in the hours, because there were going to be roughly 175,000 of them to fill.

There, that was another good one for the Not-So-Bad side of the ledger: thicker air means better sound. And more wind! The music here would be good. Well, as good as the musicians, anyway.

The corner rung was approaching—on my left, now, since I had rolled over while in trajectory. I put some care and effort into my pivot turn, did a *lovely* job, and immediately crashed into the naked man again, this time from behind, and upside down. If you can't work out where that placed my nose, good. And never mind.

Of course he had stopped and waited for me to catch up. Far enough away for me to stop in time, too—if I had happened to round that corner at a more prudent speed, while paying attention to where I was going.

"Excuse me," I said. It came out somewhat muffled, and nasal, with a small echo.

"I do," he said, and jaunted away again, leaving me drifting ever so slightly after him in his wake this time.

Fortunately I was near a wall this time. I blinked, wrinkled my nose, and jaunted after him. Again I matched speeds, and this time we were still within conversation distance, sort of. "I'm Joel Johnston," I called.

He precessed to face me without disturbing his trajectory "I'm surprised to hear that," he replied softly.

"Huh?"

"I'm surprised to hear that," he repeated, perhaps a decibel and a half louder.

I'm surprised *I* hear it, pal. "I meant, why is that?"

"The First Officer told me to meet a Joel Johnston at the aft airlock." And you did. "And you did meet Joel Johnston."

"And at the aft airlock, too," he agreed. "That's why I'm surprised." Should I ask why? No clue on his bland face. "What did you expect?"

"This is the *Sheffield,"* he said. "Naturally I expected to meet a Joan Johnson at the midships lock. I only came here first so I wouldn't confuse you by being on time. Naturally I ended up confusing us both—so symmetry is restored." I was pretty sure that was a twinkle in his eyes. But it could have been a detaching retina. Or lunacy "I'm pleased to meet you, Joel. I'm George R Marsden."

We were starting to pass other people in the corridor, a few at least. All of *them* had clothes on. All of them ignored us, busy with their own affairs, or possibly their own business. "Glad to know you, George."

He didn't wince or frown, exactly, but the twinkle in his eyes guttered. "I prefer George R."

File for later. "Of course, George R. May I ask what you do?"

Again, poker-face delivery. "I am one of the ship's six Relativists."

I'd reached boggle point. I couldn't stop myself from blurting, "*Pisam ti u hrvotoh!"* Well, it should have been safe enough. And his expression still did not . . . well, come to exist. But somehow I knew I'd poo'ed the screwch. "Let me guess, George R: you're part Croatian."

He nodded. "I have the honor to be descended from the family of Nikola Tesla's mother."

I was weary of apologizing, and even wearier of needing to. "No offense. My mother was part Croat, too. It's usually a safe language to swear in. There can't be enough of us left to keep a newsgroup alive."

"I understand, and realize you did not mean the expression literally, but merely as an ejaculation of surprise." His eyes twinkled up again. It wasn't quite a facial expression, but it did hint which one he might have worn if he'd gone in for them. "Ironically, it is in fact literally correct. By the end of this journey, we will all end up pissing in one another's bloodstreams: the system depends on it."

I couldn't help laughing.

And at last his face came alive: he laughed. It was a pretty good laugh, too, clearly the with-you rather than at-you kind. "Oh, good," he said. "For a minute I was afraid you'd left your sense of humor in your luggage."

"Just my dignity."

"You'll fit right in," he assured me. "Don't worry: both dignity and luggage will catch up with you again, from time to time."

I wish to record that this time when he made a turn, I was paying attention, and turned with him as crisply and elegantly as if we'd drilled in this.

(I did *not* realize we had been traveling until then in a direction that would later come to be called "up," and were now moving horizontally again, on a deck much closer to the ship's nose than the one we'd started from.)

What I wanted to ask, of course, was, "Why is one of the six most important people aboard this tub herding newbies from the airlock to their cubic?" But it didn't seem polite. And I couldn't think of anything lesser I wanted to ask, just now. I mean, this guy was one of the six most impor—

"I know just what you're thinking," he said.

I didn't actually hear the last word, because a door chuffed open in the corridor behind us just then and drowned him out. But I knew what it was. I was destined to spend the next nineteen years being his straight man. "Okay, why are you, then?"

"Because this is the *Sheffield."*

"Of course." No, *what* is the name of the man on *second* base.

"What would have constituted weirdness would've been if they'd sent, for instance, one of your cubicmates, who actually *knew* where the damn place—wait, now, this looks right, something must be wrong—no, this is it. Let me catch you." He grabbed a rung just this side of a door (hatch, Joel, think hatch) with one hand and braked himself to a halt, while letting me use his other hand to brake myself. Somehow I ended up stationary in front of the hatch, with him beside it to my right.

The hatch bore the stenciled label "RUP-0010-E." Below that was a sign hand-painted in some ancient font, with rather good calligraphy. It read:

The 10th Circle: a band of dopes, all we who enter here.

George R released my hand. He was smiling again. "Doubtless this will be a disaster for you, since you came to it quickly. Just try to remember at all times the Prime Law of the *Sheffield."*

I don't know plays third base. "I am keen to know it, George R."

"No refunds."

"Ah."

He was drifting away before I knew he had eyes to go. "Satisfaction guaranteed, or you're screwed. Good"—and I'm pretty sure the last four syllables as he was passing out of earshot were—"bye, Joel Johnston."

But he might have said, "bye, Joan Johnson."

I found myself grinning after him. His sense of humor was drier than fossil bone in vacuum. And it's hard not to like a man whose only facial expression is a gentle smile.

Ah, that wonderful moment just before you meet new bunkmates. Like the moment just after you step off a roof, and just before you open your eyes and look down to see how many floors away the ground is.

Deep breath. Best smile. I palmed the door. After George R's buildup, I half expected it to shock me unconscious and call for the

Proctors. But it accepted me as a resident rather than merely someone unknown seeking to annoy one, and opened to me.

As it slid open, a faint cloud of pale smoke emerged and intersected with my face. Tobacco. I smiled, mildly pleased. I'm not a nicotinic myself, but I've always enjoyed having a smoker cubicmate. It's hard not to like that scent, especially in thick air.

It's going to be a while before the biological sciences really get back on their feet, but safe tobacco was one of their very first new fruits after more than a century of enforced barrenness. The Prophet repressed the weed so savagely that it became a mark of defiance, then a symbol of rebellion, and finally a way to identify other members of the Cabal. Now he's ashes, and cigarettes no longer produce them. As my father once said, the weed outlasted the Creed.

I could see the nicotinic was the only one present in the cubic at the moment, drifting near the center. It seemed an awfully small space for four people. Then contradictory clues resolved, and my perspective shifted. The room was fine. It was just that he was awfully large for a four-person cubic. Much better. I could always kill him.

I'd have to sneak up behind him with a pretty big chainsaw, though, and take him down a limb at a time. He was enormous. Between his mass and the copious white beard he looked like a Viking chieftain, or perhaps Santa Claus's big brother. The latter impression was strengthened by the eyeglasses I could see he wore. People who do that are usually writers or visual artists of some kind: most normal people with astigmatism are willing to risk surgery with a failure rate of about one percent. At worst you need eye transplants—what's the big deal? He wore classic jeans and a baggy blouse with elbow-length sleeves.

As he rotated lazily the front of him came into better view and I saw that he was typing on air, and a hologram glow unreadable at this angle was keeping station with his face. A writer then, I surmised. He kept rotating until he should have seen me, but didn't, and kept typing furiously. Definitely a writer. I hoped he was a poet. If you threaten one with death, and mean it, they always stop. Then he rotated to where I could see his hologram from the back, and my heart sank. It was way too far away to read, even if it had not been backward—but even from here I could see it was properly formatted text, with consistent margins, nothing centered, and words arranged in paragraphs that began with indents. It was about as bad as it could be: he was a novelist.

I think I made a small moaning sound. His eyes refocused past the holo and locked on to me, and the holo vanished. His hands drifted at waist level, but somehow less like they were poised over an invisible keypad, and more like they were poised over the controls of an invisible weapon.

"Johnson," he called.

I shook my head. "Johnston," I corrected.

He shook *his* head. "No," he insisted. "Johnson."

"I'm pretty sure," I said.

"I'm positive," he said.

I closed my eyes and opened them again. "One last time: *who's* on first, *what's* on second," I said.

He frowned thunderously "I don't understand you."

"My point exactly. Let's start this routine over from the top, and see if we can identify just where gangrene set in. Ready? *Straight man:* Say, who's that handsome bastard floating outside the doorway? *Talent:* Joel Johnston, junior agronomist. Honest, I really am."

His brow and hands relaxed. "You got a corrupted copy. My script reads differently. *Dipshit*: Say, whose work am I interrupting? *Talent:* Herb Johnson, the writer. Dishonest, but I really am."

Light dawned. We had been talking at cross-purposes. "Glad to know you. Which one am I, again?"

"The other one. You coming in? I'm losing smoke."

I was starting to enter when the choice was taken from me. Three men arrived behind me, all talking loud and fast, and I found myself swept into the room before them. I grabbed the nearest handhold, which turned out to be what would be an overhead light once we were under acceleration.

The loudest voice was holding forth on English history I'm pretty sure, though I don't know which period. "—that not many people realize is that the Dukes of Hazzard used up nearly three hundred Dodge Chargers."

"So it wasn't a total loss, then," one of his companions replied. "Right. And who is this before me?"

"Johnston," I said.

He shook his head. "Close. Johnson. And who are you?"

Herb and I exchanged a glance. "My name is Joel Johnston." "He's the new guy we heard about," Herb said.

"Ah," said the third arrival. "John's *ton*. You are him, plus T."

"Actually," Herb said, "he's me, minus coffee." He turned to me. "It's going to be a long twenty years, isn't it? They've got *me* doing it."

"Welcome to Rup-Tooey, Joel," the second newcomer to speak said to me. "Home of the Lost Boys. I'm Pat Williamson, one of your new roommates."

We did the free-fall equivalent of shaking hands: approach, squeeze both hands briefly, release. "Hi, Pat. Why do you call it Rup-Tooey?"

The history expert snorted. "Because he's a phlegm-ing idiot."

"You saw it on the hatch," Pat said. "Residential, Unclassified Personnel, cubic 0010-E. RUP-0010-E . . . Rup-Tooey."

"Ah." I could think of nothing to add.

"That's your bunk over there. You'll have to tell me all about yourself."

"I'm sure there'll be plenty of time to talk," I said politely

"No, I mean you'll really have to tell me all about yourself."

"Professor Pat is ship's historian," the third arrival explained. "Thinks this makes him biographer. I tell him is dangerous: he should let sleeping bags lie. But he is encouragable. Glad to please you, Joel. Well come on the board of *Sheffield."* He pronounced it like "shuffled." "Am Balvovatz, of Luna. Am miner."

"He looks like an adult," the loud expert on ducal matters said. "They age fast in Luna."

"Give to me a fracture." Balvovatz glared at him, and turned back to me. "Balvovatz mines. In *mine.* You got rock, give you ore. You understand?" I managed a nod. "So when *Shuffled* reach Immega 714, am big shoot. Till then, like teats on male person: no more use than historian or writer. That is why slum here in UP dump with you bowl budgers."

"Dole bludgers," Williamson corrected gently.

I had to admire his restraint. And his optimism in even trying.

"I think I see," I said. "A pattern begins to emerge. How about you?"

I asked the loud expert. "What's your line? Horse whispering? Weatherman?"

It is difficult to smirk without being offensive, but he managed it somehow "I'm a Relativist," he said. "My name's Solomon Short."

My mouth slammed shut. I had just met my second wizard, in my first half hour aboard. And this one I had actually heard of. Maybe you have, too. That arrest record.

He was smirking at *himself,* that was why. "Yeah. You remember the headline they all used. *Short grounded.* They loved that one. I keep meaning to bisect a baby; they'd all die of biblical ecstasy. *Solomon subdivides tot.* Unfortunately I haven't been able to locate a donor. Was your father—?"

"Yes."

He nodded and stopped smirking. "Well chosen, sir. May I ask your own line of interest?"

It was diplomatically asked. Most people said, "Are you a physicist like your father?" and thought themselves tactful because they hadn't said "great physicist." So instead of giving my standard deflective response ("I'm involved in pneumatic generation of sequences of higher order vibratory harmonics designed to induce auditory maximization of local endorphin production"), I just told him, "I'm a composer and musician."

He smiled—no smirk component at all, this time. "This voyage has just become distinctly less intolerable. And what is your axe?"

"Saxophone."

Now he *beamed.* It made him look like a cherub who you do not yet know has just lifted your wallet. "Which one?"

"Well, since they didn't count against my mass allowance, I brought the standard four. Soprano, tenor, alto, and baritone."

He shivered with joy. "I often wish I could manage to make myself believe in a god, but hardly ever so that I can *thank* him for something. Welcome aboard, Maestro."

"You haven't even heard me play, yet."

He nodded. "And the agony is delicious. I'll leave you to sett—oh, my word! I don't see them!"

"What?"

"Tell me you didn't entrust your instruments to your luggage?"

"I didn't have any oth—"

"Don't panic yet!" he cried, sprang for the door so fast it barely had time to iris out of his way, and used both hands to swing himself out into the direction of traffic. "There may still he time," his voice said as it dopplered away.

A hand closed on my shoulder. The bone held. "Do not worry, friend Joel," Balvovatz said. "A snitch in time saves mine." He let go before I would have had to scream, whacked me on that shoulder blade, and drifted away again. Somehow I retained my grip on the overhead light, but it took me a moment to stabilize again.

"He's right," Herb assured me. "It takes time to wreck luggage, and they always save the best stuff for last." "And they're all afraid of Sol," Pat put in.

"They should be," Herb said. "They're staying behind—so he doesn't need them alive."

"This is your bunk over here, Joel," Pat told me. "Right above my own. Unless you care to discuss the matter with pistols?"

"Knives better," Balvovatz said.

"Fine with me," I said. Once we were under way it would be the upper bunk on the right. "I've had a preference for the upper ever since figured out that farts are heavier than air."

He grinned evilly (I don't care what my spell-checker says, of course there's such a word. "In an evil manner"—okay?) "Not mine."

I carefully jaunted, in a direction soon to be known as "down," over to my bed, and docked with it. I'm not sure why, since I had no luggage or other belongings to secure. I guess just to symbolize taking ownership. It didn't wait to find out. The moment I grabbed it and started using it to brake my arriving mass, one of the two *(two?)* folding angle-braces intended to support it under acceleration tore right out of the plasteel bulkhead. All three bolts—and two of the bolts on the other support. The bed immediately rotated around the remaining bolt, about sixty degrees clockwise, and jammed to a halt against the top of the folded-up lower bunk. This left me dangling from the other end of it like a tyro, trying desperately to clutch bed as well as bedclothes and avoid the indignity of being thrown altogether. I never even noticed banging my face against the wall.

The shriek of frictionally stressed plasteel, and my scrabbling-rat noises, gave way to an omnipresent rather glutinous sound, which was like silence, but different. As I stabilized myself, I realized it was the sound of men not laughing.

I turned to face the room and made, very loudly, the sound of a man not murdering anyone, yet.

Pat Williamson pointed to a spot just "below" me. I glanced down, and in a moment realized that his own bed was *not* folded up against the bulkhead. It was duct-taped to it. His had torn out of the wall, too. I could see the bolt holes. They were *not* empty. Each contained a little shiny-ended bolt stump. All six had snapped off clean. I looked, and all five of my failed bolts were the same. I looked back to Pat, and raised my eyebrows inquisitively.

He spread his hands, palm up. He wanted to explain, but couldn't do it louder than he was not laughing at me.

Balvovatz took it. "Well come into *Shuffled,* Joel. Do not worry. Is warrantee. Air leaks out, just say so. Kang sends more from Terra."

Maybe my expression made Herb stop wanting to laugh. "There's still time," he said softly "You can still jump ship and go back down to Terra, if you're one of those fussbudgets who expects everything to work. It's not too late to be sensible."

I closed my eyes. All I could see was Terra . . . with Jinny's face. "Yes it is," I said. "Where's the duct tape?"

I later learned the bunk-support bolts had been specified by a Kang Cartel engineer, and supplied by a da Costa Associates subsidiary. Both halves of the financial Siamese-twin behemoth that was underwriting this little interstellar venture. The desk that wouldn't interface properly with my PDC or phone despite nominal system compatibility for the next two days was the other way round: da Costa design, Kang manufacturing. And the blame for the complex cluster of systems failures that combined to keep all my luggage *except* my four saxophones (Sol Short rescued them, somehow) from catching up to me for another two weeks was, I was eventually able to establish, divided up roughly evenly between the two houses.

Fortunately nudity was not taboo aboard the *Sheffield.* It was not commonplace either—but nobody got upset if I sat around the laundry room naked while waiting for my only set of clothing to dry, each day, or went to and from the 'fresher without a robe. (There were ship-issue jumpsuits and robes I could have had. I preferred skin. They were, visibly, the plasteel bolts of the clothing world.)

I did end up with a lot of time to reflect that most of the Conrad empire products I had ever purchased had worked pretty reliably. And I re tained just enough sanity to realize this was probably an omen of some kind, perhaps even an unfavorable one.

But I had told Herb the truth. It was way too late to change my mind. The center of my personal Solar System had turned out to be a dangerously variable star. It was imperative to break free of her pull, while I still could, and go somewhere else, far far away.

Seven

I only know we loved in vain-
I only feel—Farewell!—Farewell!
—Lord Byron

Jinny phoned two days later, about eight hours before we left.

Theoretically she should not have been able to. I'd contributed my phone to the ship's recycler on arrival, and gotten a new one—under a false name, using nonexistent credit, and paying a premium for a super-unlisted code. That account would vanish like a bubble when the first bill went unpaid, of course. But by then I expected I would no longer need one. I only needed it now to say goodbye to a few friends and acquaintances, and to dispose of my few remaining assets on Ganymede.

I *think* that might just have been good enough to foil, or at least slow, a Federation agent hunting me. Against a Conrad, it was a gesture. As I slipped in my earbead, I reflected that she could probably have called me five minutes after I'd activated the phone. Her first words practically admitted as much.

"Damn it, Joel, I admire your stubbornness. I really do. You've held out to the last possible second, I give you that. But we are *out of time* now. Stop this foolishness and come home, this fucking minute!"

I'd known this call would come. It wasn't surprise, even at the word I had never heard her use, that kept me from answering her for several seconds. It was just her face. There on the inside of my wrist, thumbnail sized, poor quality 2-D image. I had never seen her so clearly or so vividly.

She had never looked more beautiful. I wanted to eat my whole forearm. Her image cut off at her waist, but I could see the rest of her almost as clearly in my mind's eye. What blurred it a bit was that she was wearing an outfit considerably more expensive than anything I had ever seen her in. That realization restored the power of speech to me.

"I can't, Jinny. It's too late. We were out of time yesterday. The last boat has—"

"You idiot, I can be there to get you in two hours! How long do you need to pack your four saxo—"

"Bring me where, did you say?"

"—phones and your one spare—what?"

"Where exactly is this home you speak of? Certainly not your apartment. Some mansion in Nepal accessible only by copter? A secret village at the bottom of the Marianas Trench? A stealthed palace at L-1 or—no, why would you care about saving fuel—somewhere in space, then? Or perhaps a few kilometers below the apparent surface of Jupiter, there floats a—"

She overrode me by yelling, *"I deserve that!"* I was so surprised I stopped talking. "And I ask you to believe that I have already administered it to myself, and to trust that I will continue to do so, okay? You can kick me all you like, I agree I have it coming—but you won't be able to if I don't come get you and bring you back home, and even my window is closing!"

I shook my head wearily "I meant what I said. Where is 'home' for us? No place we've ever been. No place I've ever been. I don't think we even mean the same things by the word—or have any clear idea what the discrepancies are, either one of us."

"Joel, I didn't have any choice, why can't you see that? I *couldn't* tell you, not until—"

"I know that."

"You do? Then—"

"Jinny, we've never really met."

"We *can.* We *will* meet, and we'll love each other—we already know how—and the money won't make any damn difference, none at all."

I had to grab something with my left hand just then to keep myself from colliding with a bed: I'd been drifting free since her incoming call had caused me to lose my handhold on my own desk. I guess from her perspective it looked like I was turning away. "Joel, I love you!" she cried.

I started to regain eye contact . . . and paused. I found myself looking around my room. My cruddy little dump of a room, just a bit worse than what I'd have expected as a freshman at university, possessed of few and feeble amenities, shared with three other smelly hairy creatures. In a place where nearly everyplace smelled faintly like feet, and *all* the water tasted like a school hallway water fountain, and the food aspired to be two-star, and you always saw the same people. The *Sheffield* would in fact be remarkably like another nineteen years of our courtship as we had known it until recently. Freshman year of university, forever. The only thing the big tin can had to recommend it, really, was that it was going to leap the Big Deep—

I yanked the phone back up to my eyes. "Jinny, come with me!" Shocked silence. On both sides. I recovered first.

"Right now. Without a suitcase. Without a pot. If the money really doesn't matter, walk away—come homestead with me on the other end of the rainbow. I know you don't know how, any more than I know about your world—but I'll teach you. Trust me: it's a *lot* easier to grow potatoes than empires. It's more satisfying to get in a good crop than to play with billions of people's lives and fortunes. It leaves you time to make babies, and to pay attention to them, and to occasionally notice each other past the babies and make more of them. For God's sake, Jinny, you remember the song. Let's die on the way to the stars! Together . . ."

I knew exactly how stupid and romantic and naive my words were. I had never intended to speak them—aloud. They left my mouth with the force and honesty of vomit, but with the same despair as well. Without a particle of hope.

That was only born when a full second had gone by and she still had not answered yet. At birth, it was tinier than a lepton's shadow at noon. It took less than another second to grow into something large enough to choke on. I was beginning to worry by the time she broke the silence.

But the problem solved itself, when my heartbeat ceased. "God damn you, Joel, you gave me every reason to believe you were an adult. With a pair of balls, and at least half a brain. You *cannot* be this cowardly and stupid and prideful, I won't tolerate it. I've invested too much time in you! I'm coming up there, and I'm—Joel? Joel!"

My arms had gone limp with cessation of pulse, of course: she was looking at my left hip. Purely from reflex politeness I pulled my wrist back up. So then I had to say something, and thus began breathing again.

"Jinny, listen to me. Please. I honestly don't know if I have what it takes to be a Conrad, I admit that. But I don't know if *anybody* does, so I'm not at all afraid to find out. What I do know is, it's not something I *want* to be. I guess it seems self-evident to you that any rational man would. So you won't want an irrational husband." She tried to interrupt, and for once I overrode her. "If you think even your gran'ther has enough proctors and bailiffs to delay the launch of a Kang/da Costa Cartel starship by five minutes so you can arrest a junior apprentice farmer for breach of promise, you're being irrational yourself. Now, listen to this last part, and don't interrupt until I'm done, and then you can call me any dirty names you like until they light the candle in eight hours and reception goes to hell for a while. Okay?"

"Go ahead."

She was deploying her ultimate weapon and we both knew it: her voice was trembling on the edge of tears, and they were absolutely genuine.

My own voice tightened. "Jinny—Jinny Hamilton—you were my first love. You may be the last. You certainly are the last I will have in this Solar System. For what it's worth, I forgive you for not telling me who—what—you really were. I understand, I really do: you had no choice, no other way to play it. I am sorry, genuinely sorry, that you wasted your investment. Maybe *nobody* is as sorry as I am. I'm pretty certain I'm in the top five, anyway. All I can tell you is that the prospectus you were offered was complete and accurate in every particular. I answered every question I was asked. Honestly." I took a deep breath. "My own investments haven't done too well lately, either. Thanks for teaching me to dance, and listening to me play my music. Really. Good luck in your future investments. Maybe I'll see you in a couple of hundred years, and we can swap notes." Anything else to say? Yes—but all of it angry. Delete it. It was way too late for anger to serve any purpose worth the indignity "Your turn."

The pause this time was probably as long as the earlier one, but with no hope in it, it went by faster.

"Good luck, Joel. I really am sorry" She let go on the last word, cried so hard the screen image became a sideways closeup of her scrunched up left eye.

Somehow I held on myself. "I know, honey. Me, too. Really."

"Goodbye."

The phone was dead.

For some reason I was not. So I went looking for strong drink, and did the best I could. By the time we left the Solar System I was far from feeling no pain—I was probably in maximum emotional pain, and in considerable physical discomfort from being loaded in free fall —but I was momentarily too stupid to mind either. Terra sure looked pretty, shimmering there in the simulated window, and slow shrinking didn't spoil the effect at all. In fact, the smaller she got, the prettier she looked.

The same seemed to hold true for Mama Sol. She was prettiest just before I passed out, as a single pixel of pure white in a sea of ink.

We did not really achieve enough initial velocity for the sun to show detectable shrinkage, that first day: that last view was an effect of my vision graying out. A matter/antimatter torch is not something you want to start up quickly and max the throttle—certainly not in the vicinity of an inhabited planet! We left High Orbit under conventional fusion drive, albeit a hellacious big one. Even in my stupor, it seemed noisy.

Unsurprisingly, the menu of recreational drugs obtainable on board was considerably shorter and tamer than what I'd had available to me back in Vancouver. A man who wished to stupefy himself pretty much had to rely on alcohol and/or marijuana. They did the job, in combination.

But once you used your month's ration of either one it was *gone,* so the binge burned itself out faster than it might have if I'd had more powerful tools. By the time I had binged, crashed, died, revived, and been restored to feeble continued interest in events outside my own skull and thorax and indigestive system, the Captain had just throttled the fusion plant back from a space drive to a mere power plant, and things got much quieter again for a while. The sun looked just perceptibly smaller in disk size, there in my simulated window . . . and considerably dimmer than normal, even though all the other stars now seemed brighter than usual. I thought of trying to locate Ganymede by eye, to bid farewell to my birth planet, but it was already way too late; she was in opposition.

Within an hour, the Old Man had gotten the antimatter torch lit, and some noise and other vibration did resume, but by no means as much, or as loud. Or as unpleasant. Less like an ongoing earthquake, more like a waterfall, or rapids in a stream.

Then the sun's dwindling could be detected, if you had the patience to watch long enough.

I did. For far longer than made any sense I can explain. There could he no Key West sunset, no final Last of the Light. I knew that even by the end of my journey I would not have traveled so far that Sol's light could not still reach me. It would be old light, that was all.

And still I watched, until Herb came and dragged me off for dinner. I felt so weary, it was a noticeable strain to be back in normal gravity again, for the first time in so many months. Free fall is as addictively comfortable as the womb.

Three kinds of gentleman adventurers participated in the *Sheffield's* voyage. The real gents, senior partners, invested very large amounts of money, and remained behind at Sol System to see how it all worked out. Just below them were the limited partners, who put in considerably less money, but tossed their personal bodies and futures into the pot as well. At the bottom rung were the provisional partners, whose entire stake was their head, hands, and health.

Chumps like me.

My father died thinking he had provided well for me, because he had. But such provisions don't always last. By the time my orphan's allowance had run out at eighteeen, market shifts (as always, unexpected) had all but wiped out the value of the stock Dad had left me; I'd had to sell nearly everything to finance that last semester at Fermi. After that, I'd been pinning all my hopes on the scholarship that Conrad had blocked.

Now my only remaining assets were nominal: some shares in one of the very earliest starships—which had vanished in the Big Deep years ago. They were worth so little I'd instructed my guardian not to bother selling them; the income would scarcely have covered the assorted charges and taxes. They weren't worthless, quite: there was always the infinitesimal chance that the *New Frontiers* might be found and rescued one day. But no missing starship had ever been heard from again. Only once had they even been able to establish just what had gone wrong.

So I took my meals with most of the others, in Stark Hall, one of the ship's three mess halls, designed to accommodate up to a third of us at any one time with good solid unspectacular food, drink, and ancillaries, without charge. But for those who had the money and inclination, there were also alternatives. Such as the Horn of Plenty, the *Sheffield's* equivalent of an upscale nightclub, with four-star food and more expensive amusement options, open all three shifts.

I had not expected to ever set foot in the place, unless a live waiter's job should open up, but it was there that Herb insisted on dragging me for my last dinner in the Solar System.

I did try to resist. I had known several novelists, but none with even as much money as I had. "Herb, I don't know about you, but I can't afford this. There's an old PreCollapse blues song that goes, 'If money did my talkin'*I couldn't breathe a sigh—' and that's . . ."p*>

And my voice trailed off, because the next lines of the song suddenly loomed up out of memory and clotheslined me: "But my baby's love is one thing/even money can't buy/Ain't that fine?"

Herb said, "This meal is on me. You have almost nothing in your system but poisons and toxins. The food you take on to absorb it all should be of the highest quality"

"I don't know if I'll be able to pay you back."

"I know: you probably won't, and I'll get to hold it over you forever. Cheap dominance. Come on, it's right up ahead."

I stopped us at the door and tried to thank him, but he brushed it away "Sheer self-interest. I have to live with you."

They seemed to know him inside. As we were conducted to our booth, I had that weird feeling you get entering a place that's a little out of your reach, the irrational sensation that everyone is looking at you and can tell you're out of place, which is caused by everyone looking at you and knowing you're out of place. Herb had a way of walking as though *they* were out of place, but he was a broadminded man. Jinny had had it, too. . .

A dance performance was in progress on a cleared area of the floor, something classic-modern, I think, though I have trouble keeping the distinctions straight. I don't think ballet is ever done in silence. Serious dance, at any rate, not mating dance, and apparently very well done, by three energetic people a little older than me. They finished to thunderous applause as we crossed the room, and sprinted backstage.

I did notice a bandstand, an interesting one, just beyond the dancers' Marley floor. It was powered down at the moment, unoccupied, but it looked nicely equipped. The keyboard system was built into a very good replica of a Pre-collapse grand piano; it looked as though the player could produce "real," mechanically produced acoustic sound with the thing if he chose. The drum kit too could have produced reasonable accompaniment for most purposes even powered down. The stringed instrument cases I saw were all obviously for either acoustic or hybrids. I mentioned that to Herb as we were seated.

"You watch," he said, "pre-electric music is going to become very popular in this ship over the next twenty years. We all know deep down we're going to a place where we may not have power to spare for luxuries for some time to come. Subconsciously we're preparing. Brunch menus, coffee and orange juice for two, please."

I hadn't noticed the waitress approach until he spoke, and she was gone by the time I turned around. Yet I later learned she was human. "Brunch?" I asked, checking the time.

"In a restaurant that never closes, in a ship with three shifts, it's always brunchtime. Or dinnertime. Or midnight snacktime, or tea. You need serious food that doesn't challenge digestion; ergo, brunch."

The food was indeed wonderful. It penetrated my depression, forced me to concede to myself that I did have some interest in continued life, even if I had no idea why. I was continually conscious of a sensation of having gnawed off one of my feet to escape a trap, a pit-of-the-stomach feeling that wouldn't go away. But for some reason it didn't interfere with my appetite much, or even my mood.

Herb, I was very gratified to learn, was the kind of man who did not chatter over his food. Save for a handful of conversational politenesses, he used his mouth for intake only. It gave me permission to do the same. We already knew we were going to be friends. And there was going to be plenty of time to use up our conversation stores.

When he did speak, it was with a friend's directness. "So," he said, setting down his fork, "have you decided whether you're going to cut your throat or not? Inquiring minds want to know."

"No."

He relaxed slightly. "Yes, you have. You're not."

"I really hate it when somebody tells me what I'm thinking. Or are you a telepath?"

"As a matter of fact, yes, but not the way you mean. A real one."

I snorted. "Right. Your mind isn't fast enough."

In fiction, a telepath can read minds. A real telepath is just a glorified radio, with a single receiver. But *really* glorified—way faster than any radio. Our time rate and the System's were already diverging very slightly under the constraints of Einsteinian physics, and would get steadily worse for the next twenty years. Every day, radio and laser signals took just a tiny bit longer to cross the widening gulf between us, and by the time we reached our destination it would take them the greater part of a century. But telepathy, for reasons nobody understands, takes place *instantaneously,* across any distance yet measured. That single perverse exception to the laws of the universe, and the fact that the gene for it is dominant, make a star-traveling civilization just barely possible. Our ship, like all of them, carried several people capable of telepathic rapport with a partner back in the System, usually, but not always, their identical twin. With luck, their children would be able to maintain the link.

Herb was looking at me strangely.

At first, the way his jaw was squared off, and his eyes seemed to have receded deeper into their sockets, and his shoulders were slightly raised, all combined to tell me he was angry. That was odd. Then a second later I saw I had misread the signals completely: he was *amused,* trying his best not to laugh in my face. At something I had done in the last few moments, apparently. Or said ...

He saw me start to catch on, and let the laugh out.

"Are you *kidding* me?"

"Did you really think I was accepted into this company because I'm a *writer?* You figure a fledgling colony, fighting to stay alive and establish a foothold, has a lot of use for fiction?"

"You never mentio—"

"You never asked."

"Who—?"

"My sister Li," he said. "In Oregon. The one on Terra. Two hours a day, we handle message traffic between Kang/da Costa HQ and the colony, and we're available freelance for private communications."

"I never noticed you doing that!"

"How would you? I stare into space, and then start typing like crazy. It must look exactly like I'm writing a story. Sometimes I am, if what I'm supposed to type annoys me enough."

"Holy shit." I was so busy rearranging my presumptions and misconceptions in my head, I forgot I had not yet expressed an opinion. "I can't believe it."

"Believe it. I'm a telepath. A communicator."

His voice cued me. A lot of people are weirded out by telepaths. A *few* people call them the kind of names that cause a proctor to show up. He was waiting to learn whether or not his new friend and roommate for the next two decades was one of those people.

Quickly I said, "No, I mean I can't believe there's some poor girl back in the System who looks just like you."

His shoulders dropped. "Back to our argument—I was winning. How can you stay a bachelor? Have you no appreciation for fine womanhood? No sense of obligation—"

My mind took a left. Talking about Jinny and the Conrads had reminded me of something, a small burr under my saddle. An unfulfilled obligation behind me. "As a matter of fact, I do. Both. So much so that I'm going to presume on our friendship and ask you for a favor."

"What friendship?"

"I know, but it's all I've got. I want to send a private message back to terra."

He frowned. "Phone still works. So does mail."

"No, I mean *private.* I need to thank a young lady for defying her grandfather to help me out of a tight spot, and I don't want to risk getting her in trouble."

His frown deepened. "Just tell me one thing. Is this young lady rich and beautiful?"

"That's two things. And yes to both."

"Maybe there's hope for you yet. Okay, this once, I'll do it. You want visual, or just voice?"

"Voice is fine."

He shook his head. "Hopeless. Name?"

"Evelyn Conrad."

"How do you want to route it to her?"

"Through an intermediary I think I can trust. Can your sister put a really serious privacy shield on a message?"

"Yes," was all he said.

"Okay. Ask her to get it to a Dorothy Robb, two b's."

"Address?"

"Ms. Robb is the Chief Enabler for Conrad of Conrad."

Herb came as close as I would ever see him come to betraying surprise. His nostrils flared just perceptibly for a moment, as if he had begun to doubt his deodorant. His eyes did a funny little thing where for just an instant they tried to widen and narrow at the same time. There was maybe a quarter-second hitch in the soundtrack, and then he said, "I take it back. There *is* no hope for you.'

I spread my hands. "When did I claim there was?"

"You know a Conrad. Well enough that she defied . . . oh. Kindly tell me her granddad is not—"

I nodded. "Conrad."

"Of course. She defied Conrad of Conrad for you. And you're *here."*

"Herb, she's seven years old."

He smiled broadly. It had taken him about ten seconds to gear up and start enjoying this. "To be thoroughly sure. Say no more. Unless you want to live."

So I told him the whole damned story.

I'd always known I would, *some* day. It was going to be a long voyage. But not in the first year. I probably couldn't have told it yet to anyone who didn't listen as well as he did. He didn't mind if I needed a couple of minutes of silence to get a sentence completed.

When I was finished, he took a couple himself. Then he said softly, "Amigo, you're the first person I've talked to in this bucket of rust so far that actually has a sensible reason to be here. All right, you want little Evelyn to know you're grateful for getting you out of there, but without tipping the Old Man, have I got it?"

"Something like, 'I enjoyed the last moments of our relationship even more than the first,' maybe. Do you really think you can get that to her privately? Now that you know who she is?"

He closed his eyes, then opened them again. "Li says yes. She knows a way. You don't need to know what it is. It's covered."

"Thanks, Herb."

He lit up one of his cigarettes. "Well, at least the cord is cut clean. With Jinny, I mean. Seldom in history have any humans gotten to have a breakup as final as the one you've had. By the time we get to 23 Skiddoo in twenty years, she'll be . . . 108 years old, if she was honest about her age."

We were making a jump of about eighty-five lightyears—at such a hairraising fraction of c that the trip would seem to us to take twenty years, total. But back in the normal universe, clocks run faster, thanks to Dr. Einstein's Paradox. To an observer at, say, Tombaugh Station around Pluto, our voyage would appear to take roughly ninety and one-half standard years.

"Of course, with her money, she'll probably still look twenty, by then," Herb added. "But you'll know better."

"I don't want her old," I said bleakly. "I don't want her to suffer. I want her to be here with me."

"Happy to be your mate, even if you both starve on alien soil. Was she really that dumb?"

"Obviously not."

"You'll love again. I'm sorry to be the one to tell you."

I grimaced. "Not soon."

He shook his head. "It doesn't have to be too soon. You have twenty years to decide what you want in a wife. But don't put it off too long, either. The supply is limited, and you don't look like a man who'd be happy as a celibate."

"Don't be so sure," I muttered darkly.

"Look, you have decisions to make. Some short-term, some long-term. If you plan to spend the next twenty years licking your wounds, and letting those decisions make themselves for you, you're going to be a tough friend to have. I suggest you get started working on them."

"Decisions like what?"

He leaned back in his chair. "What do you want to *do?"*

A perfectly simple, sensible question: the logical first step in making any plan.

He might just as well have whacked me in the forehead with a plank.

I did not really see a burst of bright white light, and then find myself on the ground beside my horse, godstruck. The earth did not literally tremble and roar at my feet. My heart probably did not actually pause, and I have it on good authority that time did not, at any time, in fact come to a stop. But Herb's perfectly obvious question hit me with that kind of impact. He and the room went away while I tried to cope with it.

Surely, I thought, I have an answer for him. But I could not find one. I rewound mental tape and realized with shock that I had not asked myself that question once since the night of my graduation from Fermi.

Throughout all the terrible days since, I had been focused intently and exclusively on what I did *not* want to do.

Well, *that* had been silly of me, hadn't it? Now that I was finally and forever safe from the terrible danger of becoming one of the richest humans alive, married to the girl of my dreams, perhaps it was time to give some quantum of thought to what I might find preferable. If anything.

Great blathering mother of morons, what was I going to *do* with the next twenty years? Or the twenty after that, if it came to it?

Herb was saying something. Why did I know that? Oh. He had touched my hand to get my attention. I rewound my ears. "—don't have to come up with an answer right this minute," he had said.

I wasn't absolutely sure I agreed—but just then I heard my name called. It was Solomon Short, in a larger nearby booth with three companions. He waved emphatically to us to come and join them. I looked to Herb for help, and he shrugged, so we got up and went over to the other booth. Sol's companions slid over to make room for us, while he made introductions.

As I'd guessed, his friends were all Relativists like him. I had now met five of the six people on whom our whole voyage depended. Nearest me was Tenzin Hideo Itokawa, a tiny man whom I learned later was a Zen Buddhist monk; then, I got only that he had twinkling eyes and seemed to lack vocal chords. Between him and Sol was a hearty and voluptuous woman named London McBee, who turned out to be married to George R Marsden, the Relativist I'd literally bumped into in my first seconds aboard. She and Sol volleyed with words, vying to outpun each other. But the most striking of the three was clearly the man on the other side of the table, Peter Kindred, and for the life of me I could not decide why.

There was something electric and sheepish about him, that's the best I can say it—he gave off the disconcerting sensation that at any moment he was likely to switch from talking to quacking like a duck, or barking like a dog—that at any given time there was utterly no way of telling what he might take it into his head to do—and that at the same time, he was just a little embarrassed by it. It was more than just mad eyes, though he surely had those. His name seemed ironically chosen; he had "Loose Cannon" written all over him. Sol and London both seemed to find him delightful.

I was overawed. Most of the ship's power, literally, was seated at that table. I'm used to famous people, even great people. This was different.

In a pinch, the *Sheffield* could have gotten by without her captain—but her Relativists were *essential.* These men and woman spent their days reaching into the cosmic vacuum with their naked organic brains, and persuaded it to yield up its inconceivable energy in a measured fashion.

I realize that description has about as much meaning as saying that a nuclear fission plant works because the gods breathe upon its mojo in such a way as to cause it to be far out. One of my hopes, as I sat down, was to perhaps solicit a better explanation from one or more of the Relativists I was privileged to talk to. But I got off to a bad start.

Things went fine at first. Sol introduced his companions to us. Then he introduced Herb to them, giving them a two-sentence thumbnail bio. Then he introduced me—and that's where it went sour. His second sentence for me began, inevitably, with, "His father was the—"

But by the second word, Peter Kindred had gone berserk. He kicked his chair over backward with his butt, leaped backward over it, landed several feet away in combat crouch, making finger gestures to ward off evil.

At me.

I opened my mouth—

"SHUT UP!" he screamed.

I blinked.

"Not a word! AIYEEE!" He averted his gaze. *"No facial expressions!"*

I looked at Herb, then Sol, then everybody else, without finding anything I could use. I decided I needed to leave, started to rise.

He screamed, hopped back a pace, and snatched a plate from someone's table, holding it like a cream pie in an ancient comedy "Back!" he shrieked. "You lunatic! Are you crazy? What the fuck are you trying to *do* to me?"

I shrugged. I had to: it was all he had left me.

It was the last straw; He shut his eyes, made a strangling sound, turned, and left the room at high speed. Taking the plate with him, despite loud protest from its owner.

"Don't mind Peter," Sol said imperturbably

"He's terrified of Centipede's Dilemma," said London.

"Ahhh," I said. "Of course."

"He's rude," Herb said.

"No, no," I said. "I think I actually get it." And after I explained my thinking, they agreed that I did.

Without its Relativists, no starship can operate its primary drive, open the Ikimono Portal into the dark energy universe. Not without becoming a Gamma Ray Burst in short order, anyway.

That monstrous engine of mass creation had not been invoked, yet, and could not be until we'd gotten a little farther away from Sol—but without it and its kind, most star travel would have been impossible, and the rest would have awaited the development of suspended animation to accomplish. And thanks to the Prophet's distaste for fiddling with God's allegedly clear intentions, safe suspended animation still seems to lie as far in the future as it did centuries ago.

Thanks to Relativists, though, mankind finally had a drive that could really take it to the stars, within normal human life span. The only problem was that, countless generations of folklore to the contrary, the relativistic engine really was the first engine ever invented that literally required the constant attention of a human operator to function: the Relativist. Somehow, an organic brain was able—some organic brains were able—to ensure that every time Doc Schrbdinger opened his box, what came out was a live cat. Even if none had been in there to start with.

The last I'd heard, the entire Solar System held something less than two hundred humans—out of dozens of billions!—who had the necessary combination of talents, skills, attitudes, and education to perform that task reliably. More than half of them, I had read, wanted to do something else. The rest probably commanded a higher salary than Jinny's father.

When the mathematician/poet and Soto Zen Buddhist priest Hoitsu Ikimono Roshi (whose name means "life," "living creatures," "farm products," or "uncooked food") discovered the first practical star drive in 2237—or perhaps was merely the first such discoverer to survive—he thereby created the profession called "Relativist." The best definition ever offered to the layman of what a Relativist does is (naturally) the Roshi's: he said they meditate on and with the engine, in order to make it happy enough to function.

He held back the part about how they dissuade the star drive from becoming a star . . . until humankind had invested heavily in star travel, both economically and emotionally. Fortunately that did not take long: the Roshi's only significant character flaw was reluctance to keep a joke to himself. (A great pity: it finally killed him . . . a joke he must have loved.)

Technically one could argue that Relativists should be called relativistic engineers. Without them, no engine; *res ipse loquitur.* But as it happens, the term "engineer" is already in use—by people who find the very kind of science that relativism requires to be witchcraft, spooky science, mumbo jumbo, perhaps even hocus-pocus. To them, it stops just short of being that most despised of all modes of thinking: a religion. The very first word in its technical description ruins all hope of conversation, sets engineers' teeth on edge, and makes all the hairs bristle at the backs of their necks.

Quantum ramjet.

The quantum ramjet relies on the well-established theory of quantum fluctuations in the energy of the vacuum. These occur throughout the universe on extremely small scales of time and distance. Over times on the order of 10^{-15} second and lengths of about 10^{-55} centimeter, masses as high as 10^{-5} grams and energies as large as 10^{-6} ergs pop in and out of existence interminably. Conventional physics supports this picture, but it is an entirely different matter to make use of vacuum quantum fluctuations to propel a starship. A quantum ramjet, first proposed by H. David Froning (an engineer!) back before the Collapse, would work by "ingesting" the energy of the quantum fluctuations and converting it to propulsive energy. If the quantum starship could tap only a very tiny fraction of the theoretically available mass/energy of the vacuum, it could accelerate rapidly to relativistic velocities. But until Ikimono Roshi tried visualizing something in his mind, as he sat zazen in his ship in the Belt one day, and found himself half a lightyear from home before he could stop doing it, no one had a clue how this might be accomplished. It almost certainly never occurred to anyone before then that human attention might be a necessary condition for the phenomenon. It was fortunate indeed that Hoitsu Ikimono *was* a Roshi—a Zen master, for whom sustained attention was a given—or he might never have made his way back to Sol to spread the news.

The philosophical implications of the quantum ramjet alone are startling. If, as the inflationary theory of cosmology mandates, the universe evolved from a quantum fluctuation that somehow grew to its present enormous scale, the same thing might occur as a matter of course in the heart of the quantum ramjet. Does each quantum ramjet create and destroy countless universes as it travels our cosmos, and are their crews as gods to the countless beings in the universes that support their flight?

The engineers have already left the room to vomit. And I can't really say I blame them. But who knows? You, maybe?

To an engineer, it's simple. If you can explain what you're doing in numbers, and prove them, it's science. If you can't, it isn't. End of story. There is much to recommend this view: it is essentially what keeps the black heart of the Prophet rotting in his stained coffin where it belongs. And any Relativist will happily admit she does not know how she does what she does. Nobody does. It's not at all certain, in fact, that anybody ever will.

One thing is generally agreed, however: the man who had so far come *closest* to providing an explanation—who had at least provided some useful mathematical tools for approaching the problem, and pointed out a promising theoretical path through what had been an impenetrable thicket, was a Nobel prize-winning physicist from Ganymede named Ben Johnston.

My late father.

No wonder Kindred was terrified of me. Kindred did not want even the slightest morsel of understanding of the process by which he made himself one of the wealthiest individuals alive to creep into his mind. The thing that most Relativists fear the most is burnout: utter annihilation of personality. Not Kindred. He might even have yearned for it a little. As London had said, he was terrified of the Centipede's

Dilemma. Once the centipede got to pondering just how he managed all those legs, he couldn't do it anymore. Kindred feared that if he understood what he did, he might stop being able to pull it off. For all he knew, my father might have told me some significant datum before he died, shared some crucial insight that I might be stupid enough to blurt out, whether I understood it myself or not. The risk was tiny, but to him the stakes were everything. So he averted his eyes and fled.

An engineer would call that raw superstition, primitive bullshit, childish magical thinking. But nobody cares what an engineer thinks about this topic, until he can make a big can full of people move at close to lightspeed without carrying any fuel for its primary drive. So of course they're working on it, and good luck to them.

But I can't think of any engineers I'd have been as excited to talk with over postprandial coffee as the three Relativists who remained at the table.

Nearly at once, and without warning, I found myself skateboarding right off a conversational precipice.

One minute I was enjoying the ride; the next, I looked down and saw, kilometers below, the rock-strewn base of the cliff I had just left behind me.

Why it took me by surprise, I cannot tell you. I admit it: in retrospect, I look dumb. How smart would I have had to be to guess that one of the very first polite questions to be directed at me would be:

"And what do you do, Joel?"

Now, *where* did I put that parachute?

It happened to be London who asked. The correct honest answer was: it *sheets the bit out of me.* I hadn't even had time—during my walk here from my room—to draw up a master list of my options, arranged by category, much less zero in on anything. What I did these days was mostly get loaded, and mourn my lost love. It seemed to be all I had been doing, for quite a while now.

I kind of did not want to tell three of the most interesting people on the ship that I was that big a fool. But I had no other answer to give them.

Technically I could have said, "I'm a farmer," without perjuring myself. I had contracted, as part of the price of my ticket, to spend twenty-one hours a week working down on the *Sheffield's* Agricultural Decks, sharing my putatively valuable experience and expertise in hydroponic farming. Somehow I didn't feel like going with that answer, either.

I am no longer sure, but I think I had decided on an enigmatic smile as my best response, when Sol answered for me. "You're going to love it. Joel plays the sax."

"And composes," Herb amended for me.

I opened my mouth

"How wonderful," said Hideo the little monk.

I closed my mouth

"Saxophone? Oh, I *do* love it," London said. "Are you any good, Joel?"

That one, at least, I had numerous stock answers for on tap. I tossed out the first one that came up. "I think so. Being tone deaf, I've never been sure."

"Sol?"

Sol shrugged. "I haven't heard him play yet."

"Herb?"

Herb shrugged, too. "Hasn't played a note in my hearing yet either. Stingy bastard."

"Nonetheless I am prepared to bet cash he's very good," Sol said.

"On what basis?" Hideo asked.

"I've examined his instrument closely. It is the saxophone of a man who loves it dearly, and is loved in return."

I stared at him. "You can *tell* that?"

He just nodded.

"Well, we simply have to hear you, then," London said. "Solomon, do you think the management would have any objection if we were to send for Joel's instrument and ask him to play for us, here? Failing that, we could adjourn to my cabin."

I took advantage of the discussion that ensued to think, hard and fast. I was on the edge of being committed, to something I had not chosen. Lately.

Playing sax and composing music *had been* what I did, once. They had been just about all I did, aside from thinking about Jinny. They and she had together constituted what I was, what I wanted, what I was for. Together. It had been a long time since had thought of a future as a composer without finny as part of the picture.

Maybe when all the dust settled, and all the fallout faded to endurable levels again, I would still—or again—want to be a composer/ musician. I had to admit, in fact, that it was highly likely. What the hell else was I qualified for? What else did I love nearly so much? (Don't answer that one.)

But I had not *made* that decision yet. That had been the old plan, for a universe that had Jinny in it.

And more than just that, I suddenly realized with dizzy shock—it had been a plan for a universe that had the entire existing musical establishment of the Solar System as part of the given. All the other musicians, critics, and composers, all the vast potential audience, all the sources of funding, all the supporting institutions. In a society of many billions, composer is an honorable and even sometimes honored occupation. With a target audience that huge, one need not reach all that many of them to earn a living, and respect. Now that I was going to be living, forever, in a society of five hundred people and their offspring, everything needed to be rethought.

Another not inconsiderable point: I had hired on this tub as a farmer's helper. The Colonial Council might decide to hold me to it, feeling that the colony needed shit shoveled more than it needed sax played, and until I could afford to put up enough credits for at least one Basic Share, they had as much say over my time as I did. The prudent man would divide his time between the hydroponic farm, and whatever would bring in the highest possible return in the shortest time—which did not describe sax playing in any known universe. Not even the currently most popular kinds of sax music . . . which were decidedly not what I wanted to compose.

If I did not speak up right now, these folks were going to accept me as a composer/musician. That would be awkward down the line if I ended up concluding that my life was best spent as something else altogether.

What else? I hadn't admitted it to myself until now, but what I had always been *second* most interested in, after music, was history, particularly PreCollapse history. Terrific. If anything, history was even less use than serious music, to a frontier society. If, after a long day in the fields, my hypothetical descendants had any curiosity at all about the planet the Old Farts were always nattering about, they would be more than satisfied with the copious data we already had aboard, and any new historical fact I could ever learn would already be over ninety years old back on Earth, already chewed to death. The Libra colony would one day be interested in its own history—presuming it survived—but not until at least two generations after we landed, which itself was decades away.

Okay, Joel, don't think about what else, now But start backtracking, *right* now . . . right up to the point where you'd have to commit to some other track. Otherwise you may spend the next twenty years being thought of as the composer who couldn't cut it.

"Sol and Herb spoke a little hastily without realizing it," I heard myself saying. "Music is what I *have* done. I'm not certain it's what I will do now, aboard the *Sheffield.* Or when we hit dirt at Brasil Novo either, for that matter. I'm still giving that thought."

"What other areas interest you?" Itokawa asked.

"Well, I've always wanted to try space piracy," I said.

"A step up from musician," Sol agreed drily

"Or perhaps dowsing."

London whooped with laughter, a bracing sound. "Yes, I imagine aboard a ship would be a good place to learn how to locate water. You could check your answers without having to dig all those pesky holes."

I smiled back at her. I wanted to banter with her, but also wanted this part of the conversation over as soon as possible. I had given just enough comic answers to hint that a serious one would not be forthcoming.

"You will find your path," Itokawa said. He sounded a lot more certain than I felt.

"With luck," I agreed. "Speaking of things we weren't speaking of —"

But I didn't have to manufacture a subject change, because one presented itself just then, my axe. The decision to send for it had apparently been made while I was deep in thought. Nothing for it but to play now.

But first they all had to ooh and ah, of course.

I had brought four saxophones with me, actually: soprano, tenor, alto, and baritone. (Musical instruments did not count against personal weight allowance.) But someone, almost surely Sol, had sent for my personal favorite, the one I considered my primary axe: Anna, a genuine Silver Sonic—a PreCollapse Yanigasawa B-9930 baritone, solid silver with a gold-plated hand-engraved bell and keys. The Selmer is more famous—but how often is the most famous really the best? Anna is a thing of beauty even to a layman, so elegant and precise you'd think she'd been finished by a jeweler ... and a special joy to play for those who can handle her. Featherlight keys, lightning-fast response, tone-boosted resonator pads . . . never mind, I see you yawning. Let it stand that three people who spent their working days contemplating the infinite beauty that underlies the universe thought her special enough to admire extravagantly.

Even before they'd heard a note.

The baritone sax has never been a terribly popular instrument with musicians, because it is, physically, such a screaming bitch to play. It's huge and ungainly and requires you to move an immense volume of air. But some of the greats—Gerry Mulligan, James Carter—understood that it is worth the effort. Baritone sax is probably the most powerful resonant wind instrument there is, the Paul Robeson of horns, and no other is so immediately impressive to the layman.

(A purist would note there are actually two deeper saxes, the bass and contrabass, just as there are two higher than soprano, the sopranino and soprillo, and some even recognize one lower than contrabass called the tubax—but you're unlikely ever to hear any of them.)

While I wetted up my reed, I tried to decide what to play for them.

Naturally, I wanted to play them one of my own compositions. And I was reasonably sure all three were sophisticated enough to appreciate it, if only mathematically—very sure, in Sol's case. But what if they were sophisticated enough to *hate* it? Also, I was far less sure of everyone *else* in the place, and perfectly well aware that some of my work can strike a civilian as dry and complex. To pick the most polite words Jinny had used.

Okay, wrong time and place for an original Johnston. Something immediately accessible, but not crap. I reached into the air, and pulled down a tune Charlie Haden wrote to his wife Ruth called "First Song." It was the opening number of the last set Stan Getz ever played, and it always tears me up. You'd think a tenor piece wouldn't sound right on a baritone, but that one does. It snuck up on me; before long I had forgotten anyone else was listening, and played my heart out.

I hadn't played a note in weeks, hadn't even thought of it. My fingers were stiff, my embouchure weak, my wind less than optimal. I *killed* them, that's all. You can tell when it's working. I was playing smarter than I actually am, and could tell.

For the first three or four minutes, I was imagining accompaniment. Kenny Baron, who backed Getz by himself on that long-ago night in Copenhagen. Piano as crisp as snapping sticks.

And then suddenly the piano was really there.

I nearly clammed the phrase I was playing, and spun toward the bandstand. It was empty.

Wherever the keyboard player was, he was really good. *Really* good. I quartered the room without finding him, then eighthed it with no better luck. There were several side rooms and alcoves in which he might be lurking—or he could have been anywhere on the ship, listening in and tapping into the house sound system to play along. I decided to worry about it later, and put my attention back on Anna.

That piano was just the floor I'd needed to set my feet properly. We talked, briefly, and then he set me loose to wander. Before I knew it I had disappeared down the mouthpiece. When Getz played the song that night, he was saying goodbye to his life. I used it now to say goodbye to mine. God knew what new life I would build for myself, but the old one was over for good and for all, as unreachable as a moment ago, or the second before the Big Bang. Out of the bell of my Anna I blew my scholarship, and the mentor who would appear someday to nurture and teach me, and my master's, and my debut at the legendary Milkweg II in Amsterdam, and my discovery by the contemporary serious music establishment, and Systemwide recognition, and the respect of an entire generation of my peers . . . I blew away my courtship with Jinny, and our marriage, and our wedding night, and our first nest, and our first child, and all our children, and their childhoods and adolescences and adulthoods, and their children, and all the golden years she and I would have spent loving and cherishing them all . . . I blew away both my dead parents, whose widely separated graves I would never see again . . . I blew away Ganymede my home, lost to me for so long and now lost for good, and all those who still lived on her . . . and not incidentally I blew away a quantum of wealth and power that perhaps could have been expressed as a fraction of all there was using only a single digit in the denominator.

I didn't get it all out—didn't come close—but I made a start.

I actually didn't hear the applause; Herb told me about it later.

I left the Horn of Plenty that night minus about a million kilos I'd been carrying on my shoulders . . . and with a steady gig, two nights a week, Tuesdays and Fridays, for a scandalous sum, tips, and all I could eat. Plus the private phone codes of three Relativists. Four, since London and George R lived together.

On the down side, I also left without finding out who had been playing that piano. Nobody seemed to know. The sound source had apparently been the house MIDI system—but the originating keyboard might have been in a sealed booth somewhere in the Horn, or up in the Control Room, for all anyone could tell me. All I could positively rule out was a player back in the Solar System . . . because our communication had unquestionably been conducted in realtime, without any lag at all. So I didn't worry about it. I had twenty years to find him. He could hide, but he couldn't run.

On our way back to our room, I tried to thank Herb, to explain just how much he'd unwittingly done for me, but he brushed it away "I think everybody made out on that deal," he said. When I pushed it, though, he allowed me to promise to bring home a doggy bag on Tuesday and Friday nights. And perhaps a doggy bulb of good Scotch.

After half an hour at his desk, Herb gave me a data cube and suggested I play it privately. I did so at once, so I could stop thinking about it. It was little Evelyn Conrad, back in the Solar System. Audio and video, stereo both ways. She told me gravely that I was very welcome. She said she was very cross with her gran'ther for making me go away. She said she was going to marry me one day, just the same. She told me not to marry anyone else without checking with her, first. She gave me a "private" mail address, but warned me it was not totally secure. And she closed with a solemn Bon Voyage and a blown kiss. By that point I was grinning and crying at the same time. I popped out the cube, stretched out on my bunk, and slept like a stone for thirteen hours. And when I woke, rude things and implausible suggestions had been written all over my face and hands with a laundry marker. I guess I snore.

Eight

The squeaking of the pump sounds as necessary as the music of the spheres.
—Henry David Thoreau

The first thing I did when I woke next morning was to sit down at my desk and summon a list of Positions Available. There were a *lot* more than I expected. It had apparently occurred to the expedition's planners that not only could nearly all the actual useful work of preparing to start this colony be safely put off until the last few years of the voyage . . . it probably would be anyway, humans being human. Therefore, it would be good to keep them all occupied doing some damn thing or other for the first eighteen or so years. Lots of helpful suggestions had been provided. The full list of jobs the Colonial Authority was willing to pay someone to do took well over three hours just to scroll down through at normal reading speed.

But basically most of them broke down into categories you could skim in less than half an hour, if you were a fast reader. Here's a typical screen's worth, which was sent in response to my query by an astronomer named Matty Jaymes:

•—Refining knowledge of the location and plasma properties of the heliopause between the solar wind and the interstellar medium, on the way out of town—and then the same for the heliopause of Immega 714 when we got there.

•—Again as we were leaving, helping refine our comet map of the Oort Cloud, detecting comet nuclei with radar.

•—Once we were good and gone, measuring, in situ, the density, charge, mass, species, velocity, and temperature characteristics of interstellar plasma and gas.

•—Continuous measurement of the orthagonal components of the galactic magnetic field.

•—Continuous monitoring of the interstellar medium for molecular species. Determination of mass, composition, size distribution, and frequency of interstellar grains. Performance of interstellar erosion experiments with various models of shield configurations.

•—Using the long baseline formed by the starship and Solar System to carry out high-resolution astronomical measurements with optical and radio interferometry. Performing astrometric measurements of nearby stars, extrasolar planet detection, extrasolar planet imaging, and atmospheric spectroscopy. Using the same long-baseline techniques for astrophysical measurements, for example, to image radio galaxies, quasars, and neutron stars.

(It had long been hoped that with multiple starships under way at the same time, the capability of this long baseline interferometry could be vastly enhanced by combining their observations of distant sources. It didn't seem to be working out well: the problem in this kind of interstellar interferometry was how to agree on common time-tagging of data from probes moving in different directions at significant fractions of the speed of light.)

•—Observation of low energy cosmic rays, normally excluded from the Solar System.

•—Attempting detection of gravity waves from astrophysical processes such as supernovae or neutron stars, by tracking anomalies in the Doppler effect of our signals.

•—Refinement of the dark matter map of the Galaxy ...

. . . and so on. Mind you, all these are from the list of jobs Dr. Jaymes figured he could train just about any chimp aboard to do satisfactorily. But before he sent me those, he sent another, shorter list of jobs for especially smart people, with specific qualifications, which I won't even bother to excerpt, because I didn't understand it.

He *appeared* to be saying that he wanted to make an extremely intensive examination of the sun—our sun—okay, our *former* sun—of Sol, all right?—even as we were leaving it behind us forever at high speed. Why, I couldn't imagine. You'd think if there was an adequately studied star in the universe, it would be Sol. Studied even from vessels receding at fractions of c, if that made some sort of difference. And information about that particular star was going to be of purely academic interest to anyone we would ever meet again. But Dr. Jaymes certainly sounded terribly concerned about it. When I told him I lacked the qualifications for his first list of jobs, he allowed his disappointment to show even through mail; whereas when I politely declined his second list, too, he didn't seem to care one way or the other.

Now, I don't know about you, but if I had been forced to pick one of those I just listed as my shipboard occupation, I think the option I'd have selected instead would have been euthanasia. Like any literate citizen, I love to read what astronomers have to say after years of patient data collection and astute analysis . . . but the actual gathering of the data was not my idea of a way to spend the next twenty years.

When I came right down to it, not much was.

It was that growing realization, about five or ten scrollings down the list, which caused me to stop and approach it from the other direction. Instead of wading through the Big List of Jobs, the sensible way to do this was to make a Small List of Jobs I would be willing to endure for twenty years, if I had to, and then see if by chance any of them were on the Big List.

By dinnertime I had settled on the following:

•—Teach the saxophone. Or composition. Or music history. Or history.

But did I in fact have any pedagogic skills? Forget the skills: did I have the *talent?* The indefinable intangible something that would make strangers find learning from me preferable to learning by themselves? How the hell did I know?

•—Conduct. Assuming an orchestra of some kind could be assembled out of five hundred people, and made good enough to be listened to by the rest.

Again: Did I possess whatever variant offshoot of charisma it was that would make musicians find watching me more helpful than listening to their own internal metronome?

•—Act. An orchestra might prove to be beyond the resources at hand, but surely a theater company or trideo studio would form sooner or later.

Let's just keep assuming the unanswerable question, "But did I have a particle of talent for that endeavor?" from here on.

•—Direct, either for live or canned drama.

•—Write, either live, canned, or prose fiction. Or nonfiction if necessary; I'd been given to understand that it did not pay a writer to be too fussy. Just possibly journalism, if it turned out that a town of five hundred souls produced enough gossip to need writing down. Herb could give me pointers.

And finally, of course:

•—*Play* the furshlugginer saxophone. There were other venues aboard offering dining or entertainment or dancing. If I could line up enough different sorts of gigs, in different musical genres, then between that and private parties it might just be possible to make a whole entire livelihood out of my single favorite activity, pushing air out the end of a pipe.

That, God damn it, was finally something I did know I had the talent for. The crucial question however was: Did anybody care? Or rather, did enough people care that I would be able to live on my tips?

I looked back over my list gloomily, and detected a pattern. All the occupations that interested me shared two characteristics: they all might just manage to sustain me during the two decades of the voyage ... and they would all become nearly worthless when we reached Immega 714.

Pioneers don't have a lot of time or energy for art, either making it or consuming it. It was unlikely that anybody would be willing to feed me just because I made a pretty noise, or made up stories, or pretended to be someone more interesting.

But what did it matter? Doubtless I would end up scratching so hard to feed myself and get warm and dry that most of those things would lose their appeal for me, too.

I brooded about it for the rest of the evening without useful result. I was about to collapse my keypad for the night when I noticed that I had incoming mail. That was odd. Practically everyone I knew lived in my room. Surely my Relativist acquaintances were all too busy for chat. Then I saw the header title, "Where are you?" and felt my pulse begin to rise as I leaped to the conclusion that it was from Jinny.

But no. Instead, it was from the Zog. My job search was over, at least for a while. Reality had caught up to me.

I wrote back that I would report at the start of shift next morning, at 0900. Then I went directly to bed and immediately to sleep, determined to be at his office no later than 0800.

I had formally reported to the Zog back on the morning of my second day aboard the Sheffield—but found now that I had almost no memory of the event, or the man. Indeed, I had very little recall of anything that had happened that day, or for that matter any of those last days we'd spent in Terran orbit. This was not surprising, for two reasons.

First, it turns out to be oddly difficult to make a human brain remember events that occurred in free fall: the sleeping brain, which does the filing, insists on treating such experiences as dreams. The phenomenon wears off after a few weeks of zero gee, but we hadn't hung around in orbit that long.

And second, I had spent that whole period in a mental-emotional state approaching fugue—the sort of zombie numbness one must maintain during the process of sawing off the trapped limb. The Zog must have taken one look at me and realized I would be useless until we left the Oort Cloud.

With that symbolic cutting-of-the-cord, and the colossal bender with which I had marked it, and finally my musical catharsis with silver Anna at the Horn of Plenty, I had finally snapped out of my funk, rebooted my brain—just that day, really.

And several decks away, a man who had seen my vacant face exactly once, for less than a minute, had sniffed the air that morning and somehow sensed that I had finally germinated, and was ready to plant. That's the Zog for you.

Kamal Zogby was a Marsman who made you think of Martians. He didn't have three legs—as far as I know—but he was unreasonably tall and thin, even for a Marsman, and bowlegged, and slow moving unless he was in a blurring hurry, and he had an almost Martian distaste for sitting down or any posture but bolt upright. Also he was as taciturn as a Martian, with a similar sort of gravitas, and sometimes could be almost as hard to read. And like a Martian, the Zog never needed to look any thing up.

But no Martian ever had a nose like that great ice-axe Lebanese honker of his—or many humans, for that matter. Nor did Martians have teeth anywhere near that big and white and frequently displayed. And he was unlike any Martian ever hatched in two important ways that made it possible to work for him. He genuinely cared about everybody he ever met, found them interesting. And he had a strong and subtle sense of humor.

He was not a botanist, or an agronomist, or a plant physiologist, or a hydroponicist, or an anythingist, really—not on paper, anyway. He had no degrees at all. He was just the Straw Boss.

Back on Mars, literally dirt poor, he had once kept a whole dome-town in food, water, and air for twenty years after a catastrophic ecocollapse nearly wiped them out. They said if a thing could be grown, under any circumstances, he could grow it hydroponically. He could grow *lemon trees* hydroponically, or succulents, or even fungi.

And in theory we might even have managed to survive a hypothetical total failure of the hydroponic farm—because with part of his time the Zog also oversaw an experimental two-hectare half-meter-deep dirt farm that took up an entire deck, just above the Hydroponics Deck. It attempted to mimic the conditions we expected to find on our new home-to-be, Brasil Novo, second planet of Immega 714. The hope was that by the time we got there, we would know as much about how to dirt farm there as we knew about hydroponics now. And meanwhile, if something ever went horribly wrong down on the Hydroponics Deck, two hectares of land were just barely enough to feed five hundred people. In theory.

Finding the Zog's office, down on the Voyage Farm Deck, was easy Gaining access was even easier, even though I had arrived well before the beginning of shift as planned. There was no execassist or persec or even door sentinel program to run interference for him. There was no *door.* Just an open doorway beneath a sign that read "Straw Boss." Unfortunately, there was no Zog on the other side of it either. Or anyone else; the office was empty. I waited expectantly for his desk to tell me where he was, or at least when he would arrive, but it didn't. So I told my own doppleganger to consult the ship system and locate him. After a noticeable hesitation, the ship politely declined to cooperate: the Zog was delisted. If he had a schedule on file it was not public. The ship declined to make an appointment in his name. It advised me to either take my chances and wait, or leave a message for him and go do something else.

I didn't much like either alternative. Especially after looking around the office: my strong impression was that he dropped by there once or twice a week at best. So I decided to hunt around for him,

The choices were a) this, the hydroponic Voyage Farm Deck, or b) the dirt-based Destination Farm Deck immediately above it. The choice kind of made itself.

The hydroponic farm operation was as intricately choreographed, complexly layered, and densely packed as any terrestrial jungle, with trays of assorted growing things stacked up to four high in places on frail-looking frames, and a bewildering variety of different lighting, watering, drainage and airflow systems, each tailored to a different variety of crops. The longest uninterrupted sight line on that deck was about three meters—and the lighting was so weird, with LEDs, metal halides, and sodium bulbs of assorted colors and intensities competing and clashing in odd ways at different places that you wouldn't have wanted to see much farther than a few meters in any direction anyway. The air circulation was so intense, in order to carry away the heat from all those lights, that there was a constant wash of white noise muffling all other sounds.

The farm immediately overhead, on the other hand, was basically a huge heap of somewhat modified dirt, above which a few seedlings, sprouts, and shoots should just be starting to become visible. If the Zog was on that deck, I could probably pick him out by eye very quickly. It was definitely the place to start looking. And I had a hunch it was where I would find him: where green things grew up out of soil you could plunge your hands into.

It wasn't quite that easy, in fact. But close. The Destination Farm was designed to be as close as possible to one enormous deck, with *long* sight lines in nearly all directions. But it was also designed to be kept at destination-normal conditions. That meant, among other things—at least at the moment—air that was half again as rich in oxygen, slightly denser, a *lot* more humid, and a bit warmer than ship-normal (Terran Sealevel Standard). All of which meant, among other things, weather—specifically, fog. It was controlled somewhat by air circulation, but less than it could have been, obviously by intent. Apparently we were all going to spend our golden years on a planet that was prone to lowlying fogs and mists for at least part of the year. Brasil Novo would be a kind of Jungle World, a steamy hothouse of a place.

(It began to dawn on me that there was a *lot* I did not know about our destination planet—my new home-to-be. I had more or less presumed that if a whole lot of people were willing to go there, forever, it must be a nice place. It might, I thought, be well to delve into that just a little deeper.)

Another problem facing me was that since this was the deck with the most open space and the most experimental food, this was the deck where the majority of the livestock was quartered and processed. Not to put too fine a point on it, the fog *stank,* and rude noises seemed to come distantly from all directions, as if some mad ventriloquist had descended to fart jokes.

And finally, it was blinkin' dark in there. Brasil Novo had a day just a hair *over* twenty-four Terran Standard hours long—thirty-six minutes longer. Therefore so did this deck, which meant that its day and ours diverged. And had been diverging since whenever the Zog had started its clock. It was the beginning of the morning shift everywhere else in the *Sheffield,* but here it appeared to be at least an hour before dawn.

Despite all these handicaps I found the Zog within a minute or two of my arrival. I had heard him laugh once before, and heard him now from a few hundred meters away. That got me started in the right direction, and luck took me the rest of the way. If that's the word I want: he was at the goat quarters, one of the riper of the animal enclaves. Goats just are not happy unless you give them some equivalent of a cave or shed to hide in at night, even though there's nothing to hide from . . . and then it concentrates the smell wonderfully. Maybe that's what they like about it.

Admittedly they are worth a bit of smell. A goat eats ten percent as much as a cow, but produces twenty-five percent as much milk. And many, among them me, say it tastes better than cow's milk. It's also easier to digest.

"Ah, Joel." He looked up from a hoof he was trimming and gave me a slow once-over, beginning and ending at my eyes. He had done that the first time we'd met, too. I wondered why I didn't find it offensive. When he was done, he smiled with his whole face. "I'm very glad to see you're in better spirits."

"Director Zogby, I want—"

"Zog, please."

"Zog, I appreciate your understanding and patience, this last week. I needed to work some things out, and I have."

"I can see that. You're ready to come to work."

"Yes, sir."

"This is Kathy—she's a Marsman like me, new to farming."

Intent on my new boss, I had almost completely tuned out the companion holding the goat for him. She was about my age, slim, fit, and extremely uncomfortable holding a goat. We exchanged polite noises.

"Kathy, Joel's from Ganymede. He has a lot of farming experience, dirt and hydro both. You'll be his assistant." She nodded, too busy to keep eye contact.

I took a deep breath. I was not looking forward to this next bit, but there was no sense putting it off any longer. "Uh, Zog, perhaps I should correct one small mis—oh, shit."

The sentence aborted in that odd way because I had just seen what she was about to do. There was no time for me to say anything to stop her—and it wouldn't have helped anyway, because there was nothing she could do about it. She couldn't have gotten a hand free without being kicked. There was just time for me to drop to my knees, cup one hand behind her head, place my other index finger just below her nose, and press hard. She let out a yelp and tried to shake free, but I wouldn't let her until I was sure the job was done. Then I released her at once and backed away

"I'm very sorry, Kathy" I said. "I had to do that."

She was staring at me as if I'd grown fangs. *"Why?"*

"It's the only sure way I know to stop someone from sneezing."

"What?"

"Excuse me just a minute, Kathy," Zog interrupted. "Joel, what was it you were just about to say?"

"Oh. Uh . ."

"You were going to correct something?"

"Why shouldn't I sneeze if I want to?"

"You *really* don't want to sneeze in a goat shed," I told her. "Look, Zog, I—"

"Why the hell not?"

"Kathy, please, he'll explain in a minute. Go on, Joel. Correct what?"

"No, wait a minute, Zog," she insisted. "That hurt."

"I know," I said, "and I'm really very sorry"

"No, you're not."

I started to argue, and stopped. "You're right. I kind of feel like you had it coming, for not knowing what you're doing. And now I'm also a little annoyed at you for presuming that *I* don't. If you'd—"

"Joel," Zog cut in firmly, "I understand that you'd rather have that conversation. First, though, we're going to have the one where you tell me just what misunderstanding on my part needs to be corrected. Kathy, pipe down and let her go."

She sighed in exasperation and released her hold on the goat, which sprang up and trotted to the far end of the small shed, limping slightly on its half-trimmed hoof. I turned to meet the Zog's eyes. Irritation was in them, but compassion as well. "Well, look, what you have to understand—"

Kathy sneezed.

I think it was at least half deliberate, a gesture of defiance. Her hands were now free; she could have done as I'd just shown her. Instead she sneezed. And not just a ladylike little *choof,* either, but a breathquake that might have snuffed out a blowtorch.

Unfortunately, a human sneeze apparently sounds very much like the word for "Run for your life!" in Goat.

So we all got very busy there for a while.

When things settled down a bit, I poked my head up and found that I was in the corner of the shed farthest from the exit. The original exit. I had begun to congratulate myself on my good instincts when I realized there were now several brand-new exits, one of them less than a meter from my head. A goat hoof can be a weapon of terrifying power, and a partially trimmed goat hoof could only be worse.

Then I discovered Kathy, underneath me. Maybe my instincts were okay after all.

I rolled off her, intending to ask if she was all right. Instead I let out a squeal and kept on rolling. Killer monkeys—

But, no. Within a revolution or two I had seen that what was dangling from the ceiling was not the huge ape my brain had first decided it was seeing, but someone with considerably better instincts than mine. Only by luck had Kathy and I managed not to be in the path of a fleeing goat—but *none* of them had been running up. Zog let go of the rafter and dropped back to the floor. He landed just beside Kathy, and lifted her to her feet with one big hand. "Are you all right?" he asked, and she ran a quick inventory and assured him she was.

"I'm sorry if I squashed you," I said, getting to my own feet.

She shook her head. "No problem. You know how to use your elbows."

I found myself blushing.

And her blushing back. "Besides," she went on quickly, "if I'd only listened to what you were trying to tell me—"

"No harm done," Zog said. "Except to the shed." He glanced around at the damage and sighed. "It was guaranteed goat-proof."

"I'll bring it back to the store," she said.

He shook his head. "Traveling at relativistic speeds voids the warrantee."

"Figures."

"I'll go round them up," I said.

"We all will," Zog said.

"That's okay," I said. "I'm the new guy. And I really should have taken the time to explain to Kathy why—"

"We all will," Zog insisted. "Once we patch this shed together well enough to hold them again."

And of course he was right. Catching a goat is just barely possible for three people working together; I doubt any two of us could have caught even one. The hairy little bastards led us a merry chase. A goat can leap pretty well even in terrestrial gravity; in one-third gee they begin to seem more like large birds than mammals. Large smart birds, with offensive armament.

By the time we were done, I was thoroughly exhausted, and quite understood why many cultures have used goats to represent Satan. I left the shed and flopped down not far from the entrance, with my back against an intact section of wall. Zog took a seat beside me—with noticeably less effort, even though he had nearly twenty years on me—and Kathy dropped into a tailor's seat facing us. The three of us sat in silence for a while, Kathy and I because we were getting our breath hark, and Zog because he had nothing to say.

Finally Kathy frowned, shifted position slightly, reached beneath her, and removed something. She held it out on her palm to examine it. A slightly squashed goat berry. I managed to choke off the giggle and to slap on my poker face, but it took me a few seconds, and I was sure she'd heard me at it. She looked up, our eyes met, I waited to see if she would flare up at me—

It so happens that the average goat turd is just the size, shape, and color of the data beads used to hold video or audio programming. When she took it between thumb and forefinger, and pretended to be trying to insert it into the docking slot on her wrist CPU, it wasn't what you could call a hilarious jest. But it was excuse enough for a tension-releasing blurt of laughter from both of us.

"That music sounds like shit," Zog said, and we laughed harder.

After a while we went back inside, and Zog had Kathy and me finish hooving that goat together, and pass out treats to all of them, to calm them down and by way of apology for our carelessness. Then we left, and Zog said, "Joel, I believe you were about to correct a small misunderstanding on my part about your background."

Ah yes. "Well . . ." His eyes met mine, and I heard myself say, "Not a misunderstanding. I lied, Zog. Not about dirt farming—but pretty much everything I put down about my experience in hydroponics is pure goat berries. I'll come in real handy in twenty years, when we all start doing this kind of farming on a large scale, at our new home. But right now, you're going to need short words and long patience."

He just nodded. "Why did you lie?"

"It was the only way I had to get a berth aboard the *Sheffield.* And I *really* wanted one."

I'd been sweating this moment for days now. He nodded again, and that was the end of it. "We'll begin your education in hydroponics tomorrow. For now follow me," he said, and took us on a grand tour of that deck.

It really was a wonder, a Garden of Eden such as no planet had ever seen, designed and constructed so that the local light intensity of any given square meter of that vast area could be varied from zero to noon in Baghdad, with equivalent control of humidity, airflow, O_2 and CO_2 content, and some other factors I forget. Those crops that were able to thrive on a twenty-four-hour light cycle (or other variant) could do so, without disturbing the slumber of the ones nearby who liked things the old-fashioned way. Those that were reasonably happy in the different conditions that obtained on our destination planet were already enjoying them, and all the rest would, hopeably, be successfully reconditioned to enjoy them over the course of the next two decades.

The goats notwithstanding, the staple meat aboard the *Sheffield* besides chickens was not chevon but rabbit—low fat, a milder taste than chevon, and easier to cook. (You couldn't subsist on rabbit alone —not enough vitamins A or C—but we weren't trying to.) They're less fussy eaters themselves, too, happy to live on alfalfa with a pinch of salt, which both upper and lower farms produced in plenty. Each doe and her litter took up about a square meter of living space—but a stackable square meter—and about twelve times that in alfalfa; the yield works out to about 150 kilos of boneless meat per hectare per day.

What was left of the rabbits was fed, along with each day's dining-hall waste, to chickens. They too insist on a dark stinky home, like goats. But it's safe to enter it even with a head cold, and the reward is four or more eggs per colonist per week, plus fried chicken.

And finally there was fish—the last stop on the tour. Mars-bred fish, as productive as the rabbits in terms of protein, and less trouble to care for. As we were strolling there from the chicken run, Zog told us that one of the very few stabs at genetic manipulation the Prophets had ever approved was an attempt to breed a chicken that would reliably lay an egg a day—the Holy Ones *liked* eggs. "The Church's breeders were successful, technically," Zog said, "but unfortunately the resulting chicken was literally too dumb to eat. If you want to take that as a metaphor for the True Church's whole approach to science, you're pretty astute in my opinion."

"God," Kathy said, "what a shitstain in history."

"Middle Ages were worse," Zog said.

"Maybe—but *we could have had immortality by* now! We could have beaten cancer by now. We might have had telepathy by now." She sounded angry

"We have telepathy," Zog said mildly.

"Sure, terrific. But only in identical twins, and fewer than four percent of them—and we don't have the faintest idea how they do it, or why they can and the rest of us can't."

"True. There remain mysteries to be solved."

"It's infuriating."

She really seemed upset. I decided to distract her with a diversionary anecdote. "Let me tell you both my very favorite mystery," I said. "You reminded me of it just a second ago, Zog, and it's related to what you're talking about, Kathy. Kind of, anyway."

She didn't answer. "Go ahead, Joel," the Zog said.

"I ran across this in a book. Just before the Hiatus, natal medicine got so good that they were sometimes able to save babies born so prematurely that they had not yet even developed the sucking reflex. And now that the Prophets are all finally holding services in Hell, we can do that again: rescue babies that are, in the Zog's colorful phrase, too dumb to eat."

"How?" Kathy asked. "Force-feed the poor things?"

The Zog shook his head. "They'd never learn, then."

"No, they train them to suck," I said.

Kathy frowned. *"How?* If something is too dumb to figure out that eating is pleasant, what the hell do you reward it with?"

I smiled. "Music."

Her face smoothed over. "Oh, I love it."

"Rhythm?" Zog asked.

"You'd think so, but no," I said. "Melody. The little buggers will work hardest to bring about repetition of a favorite scrap of melody. *That's* how hardwired love of music is, in the human brain. It *predates* survival instinct."

"It doesn't seem reasonable," Zog said. "How would a brain evolve so?"

I spread my hands. "Ask God. I just work here. All I know is, it's my very favorite mystery."

"You like music, too?" she asked. "I like it a lot."

"What kinds?"

The question seemed to puzzle her, but she gave it a try "Audible."

She liked everything? It seemed to me, in my sophistication, that people who liked everything must understand hardly anything. I was eighteen, all right?

"For the past hour I've been thinking this place could use a banjo player," I said.

"There are two listed," she said, "and one other who isn't. They're all pretty good."

"How do you know that?" I asked.

She shrugged. "I did a data search for musicians, way back on Terra, and listened to all their audition recordings. I also asked the ship to alert me anytime someone makes live music, and let me listen in if they haven't put privacy seal on it. I discovered at least half a dozen unregistered musicians that way. In fact, the best musician I've heard aboard so far was unlisted. He came aboard at the last possible minute, so they waived his audition."

I opened my mouth, closed it again.

"What's his instrument?" the Zog asked her.

"Saxophone. I sat in with him, remote, for a few numbers. I wanted to introduce myself afterward, but by the time I got the system to give up his phone code, somebody he was sitting with put a heavy privacy shield on the whole table."

"Have you tried him since?"

My kindly wristband produced the chip-chirp indicating a watch alarm. Today's shift was over. Saved by the chip. "Zog," I said, "I really hate to act like a clock-watcher on the first day I've bothered to show up, but I really do need to—"

"There are things we need to talk about," he interrupted.

"I know. Uh . . . I could meet you somewhere in a couple of hours. Your office?" I shifted my weight from foot to foot as if I badly needed to pee.

"Go. Our AIs will work something out."

"Thanks Zog nice to meet you Kathy see you both tomorrow." I fled.

Nine

One can travel this world and see nothing.
To achieve understanding it is necessary
not to see many things,
but to look hard at what you do see.
—Giorgio Morandi

"I don't get it," Herb said, squinting at images on his wristband's monitor.

"This girl is clearly much better-looking than you are, even with the baldness, string warts, and that glass eye. You raved about her piano playing—and you say she appears able to endure your own instrumental atrocities, so it's certain she has a forgiving nature. Did she google up bad?"

"I haven't tried yet. I mean, I haven't tried. I'm not interested, I keep telling you."

"Age, height, mass, marital status, economic status, state of health, attractiveness, talent, all apparently compatible within reason. And you can forget *all* those factors, and remember just the three important things."

I rolled my eyes. "Go ahead."

"She is a female mammal, she has a pulse, and she thinks you're the best musician in the colony."

I grimaced in exasperation. "Didn't you hear me? I'm . . . not . . . interested. I told you: I *took* that class. I'm done with women."

He put his own exasperation into a sigh instead of a grimace. "Joel, twenty years is a long, long time. And it's going to seem even longer, with an attitude like that."

"She and I have nothing in common. Didn't I tell you what her greatest dream for mankind is? Telepathy, for Murphy's sake!"

"Something wrong with telepathy?" he asked mildly.

I blushed. "Aw, you know what I mean. She's talking about the kind where nobody has any secrets and yet we all love each other. Fantasy."

Herb had successfully passed two other Secret Messages back to little Evelyn Conrad for me so far. Her replies always cheered me up. But they always came back via conventional electronic mail rather than telepathic courier; for some reason she was willing to accept information from a telepath but not give information to one. I was a little afraid she might be overestimating the security of whatever mail route she used. So I kept my own messages to her to a minimum, for fear of getting her in trouble with her elders.

Thinking about telepathy gave me an idea. "Hell's bells, Herb, why don't *you* take a run at Kathy?"

He looked at me strangely "Really?"

"Well, you're obviously interested in her. And she doesn't find telepathy weird."

"You wouldn't mind?"

I closed my eyes, counted to five, opened them again. "Why would I mind? Haven't you been listening? I'm through with romance, I'm through with love, I'm through with counting the stars above."

"You're really serious about that, then."

I rolled my eyes upward and asked the ceiling to bear witness to the tribulations I had to endure here below. "Yes, for the love of—is that you or me?"

He brought his wrist to his ear. "You. Go ahead."

I tapped my own wrist. "Yes?"

The face on the screen was unfamiliar to me, as his first words confirmed. "Mr. Johnston, we haven't met yet. My name is Paul Hattori. I am the colony's banker. Forgive me for disturbing your privacy, but there is a matter we should discuss at your earliest convenience. A matter of some importance."

I thought for a second. The day was young—hell, it was still before noon. But my morning had been overfull of stimulating inputs. I was tired, and confused, and wanted only to put my feet up and try to get some thinking done about everything that had happened that morning. "How about tomorrow?" I temporized.

He hesitated. "I will of course follow your wishes. But I have information you really should have as soon as possible."

What could he possibly be on about? Was this some sort of pitch for investment advice or banking services? He had access to my financial records—record—surely he must know I was a dry hole. "Can you give me some idea what it's about?"

He was smiling, but there was something odd about the smile, something I couldn't put my finger on. It wasn't phony, exactly. Just odd. "I can, but if you will forgive me, I would greatly prefer to tell you in person."

I met Herb's eyes, raised an eyebrow. He shrugged. "Are you sure you don't want Communicator Johnson? Same address, he's my roommate."

"No, it's you I need to speak with, Mr. Johnston." He gave an address only one deck below the officers and crew. He was a VIP.

"All right, I'll be there in half an hour. But I still think you have the wrong bloke."

"Who was that?" Herb asked.

"Never mind," I said. "It can't be important."

I started to change to better clothes—and changed my mind. Why should I dress up for this joker? I wasn't the one who'd asked for this meeting. Showing up was courtesy enough; putting on formal tights and collar would be obsequious. I had no reason to impress the man . . . because I had absolutely nothing to impress him with. He had nothing I wanted. Pausing only to empty my bladder and comb my hair, I left dressed just as I was: like a man who had recently been in a goat shed when somebody sneezed.

I took my time on the way, too. So I had time to develop a dark suspicion as to what he might want to talk to me for, which quickly built itself into an ugly and plausible theory.

Hattori was a banker. Bankers know all about very large sums of money. Did I know anyone who was connected in some way with very large sums of money? Had 1 not, indeed, recently roundly pissed off some people of that description? If they took a notion to have some sort of heavy weight dropped on my scrotum in retaliation, might not a banker be their chosen instrument?

It was hard to sustain alarm. As far as I knew, I really was bulletproof, from a financial point of view: I had nothing to steal, no credit to ruin. If the Conrads wanted vengeance, they would just have to have me beaten or killed like civilized people.

Nonetheless by the time I reached Hattori's cabin I was paranoid enough to be feeling just a bit belligerent. I was going to stop just outside his door and take a few deep breaths to calm down, but the door recognized me and opened before I had the chance.

I had expected his quarters to be impressive. They exceeded my expectations. They were tasteful, supremely comfortable despite a Zen simplicity, luxuraous without ostentation. A Hawaiian slack-key guitar played at background level—Cyril Pahinui, I think. I was given an understanding chair, and offered a beverage impressive enough to denote respect, which I accepted.

Banker Hattori was a pleasant-looking cobber. I'd have guessed his ancestry at a combination of something like Hawaiian or Japanese and

Scottish or German. He was short by Ganymedean standards, a little short even by Terran reckoning, but well proportioned and clearly in excellent physical shape. Back on Terra, he might have sailed, climbed mountains, run marathons, flown an ultralight. Now that those joys were lost to him for the next twenty years, he probably played a competitive but noncontact sport, and worked out. But he was not hard to take the way some jocks can be, did not challenge.

In person, his smile was as subtly *off* as it had been over the phone. The surprisingly few seconds he wasted on polite ritual and pleasantry gave me just enough time to figure out what was odd about it. He was clearly a man who smiled a lot, in his off hours—the placement and depth of the smile wrinkles at his mouth and eyes told you that—but he was unaccustomed to smiling like that *at work*.

In retrospect, it's actually pretty impressive that he didn't drag it out longer than he did, surround it with even more of a big drumroll buildup. I couldn't have blamed him if he had. He must indeed not have gotten to impart news of that particular sort very often.

But he was a professional, and also I think a reasonably kindly man, so he merely teased me with it until I wanted to throttle him.

"You have made no financial investment in this colony so far, Joel," he began. We were Joel and Paul by then. "Looking over your records, I see that your motives in joining us were personal and emotional rather than economic. I would like to explain, briefly, why I think that was a mistake, and then—"

"Paul, excuse me for interrupting, but your pump is sucking air. I have no capital at all."

He held up his hands. "Please—indulge me for just a moment. Think of it as a hypothetical. I did say 'briefly'."

He really did have a nice smile. Odd or not. "You have the floor."

"I say I am the ship's banker, and that is one of the things I do. I am also our colony's chief financial adviser, and act as its representative."

I nodded, impressed. "Quite a job. It can't be easy, arranging to borrow such stupendous sums, let alone handling them wisely"

"Let me give you an imaginary hypothetical conversation between me and a Terran banker, shortly before we left the Solar System."

He proceeded to act it out, using different hokey but clever cartoon voices:

"Banker: Greetings, gentleman merchant adventurer, hereafter known as GMA. I assume you're here to ask about a loan, and I'm sorry to say money is very tight just now—

"GMA: I have some lubricant with me.

"Banker: Excuse me?

"GMA: I can help solve tight money. I am here to discuss a loan, as you suggest. But I don't want to borrow. I want to lend *you* money."

"Banker: Really? Well, now. That would certainly be agreeable, in principle. What sort of terms and conditions did you have in mind?"

"GMA: Here is a check, representing gold dollars in Zurich.

"Banker: How m—oh my, a great many

"GMA: A very great many.

"Banker: I . . . see. And you want to give it to us.

"GMA: I want you to invest it for me at compound interest. A rate of eleven percent a year would be acceptable.

"Banker: That is a very high rate of interest!

"GMA: Not if I undertake not to touch the money for twenty years ...

"Banker: Ah. I begin to see. But what's in it for me—besides the usual fees? How does this loosen tight money?

"GMA: You have the full use of that money for twenty years, and keep all the profits. All you have to do is invest soundly enough so the capital sum remains intact . . . a trick venture capitalists like yourself are rather good at.

"Banker: Well, thank you. But I don't see what's in it for *you.* For the same twenty years, you're depriving yourself of that same money, receiving no payments.

"GMA (smiling broadly): Yes, but you see, I intend to age more slowly than you. . . ."

He smiled.

"I get it—I think," I told Paul. "It really is a clever swindle."

"It's not a swindle," he said.

"It has to be. People are earning large sums of money for either sitting and waiting, or else for traveling expensively. *Somebody* has to be getting swindled for it. TANSTAAFL."

"That principle doesn't apply here. In this one case, there is such a thing as a free lunch. Wealth is being created by *time.* Nobody's being swindled because nobody's *losing* anything."

I must have looked stubborn.

"The key phrase was, 'You will have the use of that money for twenty years.' Suppose the moment we get to Immega 714 we do an instant one-eighty, slingshot around it and hotfoot it right back to Sol at the same speed. It took us twenty years to get there, twenty years to come back; we arrive at Terra forty years older than we started. But what we find when we debark—"

I started to see it. "Finagle on fire!"

"—is a Terra more than one hundred and sixty years older than when we left it."

"With a hundred and twenty years of free interest!" The beauty of it washed over me.

"Not free," he said. "We had to get our butts up to a large fraction of c, and keep them there for forty years. But real cheap. Are you ready for more of the special blend?"

"Oh, that really is lovely, Paul," I said as he poured generous refills for both of us. "You're absolutely right: for the first time, I genuinely regret not having been able to kick any money into the pot myself."

"Well, theoretically, of course, a person could choose to buy in even now—or for that matter, at any point in the trip, although the degree of participation would naturally go down some as the voyage gets longer."

I grinned, and a faint tingling of the lips told me the special blend was beginning to hit me. "With what I make turning shit and piss back into food, plus what I hope in my wildest dreams to earn in tips playing at the Horn of Plenty, by the time we reach Peekaboo I can confidently expect to see profits in the low five figures."

That mysterious smile had never quite left him, even when he was playing Banker and GMA. It was still there, and now his eyes were twinkling, too. "Joel, let me tell you about another starship, a long time ago. One of the unlucky ones. There was bad sickness aboard, one you didn't get over. Both their telepaths died in the first wave, so the only reports were by radio and laser. Some of their Relativists died, and then it was reported that all the others were infected, and the quantum ramjet was being shut down. That cut the power for the radio and lasers, and the ship passed from human history."

This was sounding oddly familiar. Hard to pin down the memory, though: when I closed my eyes to try, the room began to rotate around me. Counterclockwise. "Heard about a ship like that, once." No, clockwise. "Lost in the stars, forever."

"Only, not," Paul said. "They were very lucky. Their first bit of luck was that their plague, whatever it was, burned itself out completely with seventy-five percent of them still alive. They were able to keep the antimatter engine alive, stroke of luck number two, which gave them enough, power to survive, and run all the machinery. Including the databanks they'd brought along with them, the total accumulated knowledge and wisdom of the human race at that time."

"Very important," I agreed. "Keep them from going crazy with boredom and despair."

"Way more important than that, because of their third bit of luck."

I knew he was toying with me somehow but it didn't feel unpleasant, so I played along. "And what was that, Mr. Interlocker... Mr. Inneroculator ... what was that, Mr. Hattori?"

"One of the Relativists had conceived and bore twins on the voyage. The children lived."

"Really? Oh. Oh. I think I get it! When they—"

"When they grew old enough, they studied everything they could find on their mother's profession. One day when they felt they were ready, they somehow relit the quantum ramjet—and resumed the voyage."

"That is amazing! What a story. Oh, they must have flipped back at Terra when they started getting radio messages from a ghost ship! How long did . . . wait a minute . . . oh, hell, I can't do math when I'm sober."

(The gene for my father's kind of mathematical talent is, fairly self-evidently, recessive.)

"Nonetheless, your intuition izh correct—excuse me, is correct." Nice to know he was feeling it, too. "If the happy news came by radio, we would not be receiving it for several years yet. That's the fourth bit of luck. One of the twins inherited some of her father's talent, as well—and Dad had been a Communicator. She scared the witch—the wits—out of her uncle back in Luna, the first time she made contact. He thought he was being haunted: his late brother had never mentioned any offspring."

I shook my head, which stayed on. "Incredible! I have to tell my friend Herb that story—he's a writer, *and* a Communicator, he'll make a meal of it. A dozen movies will be made about it just in the next year, and at least one miniseries. Thanks for telling me, for, thanks for, why the hell did you *tell* me that, Paul? I mean, it's a great story, but what has it got to do with what we were talking about, swindling money out of time? What's the connection?"

That omnipresent smile suddenly blossomed into a fullblown grin that lit up his whole face, and his eyes beamed happiness. "The name of the prodigal starship, Joel."

All the pieces finally fell into place, and I knew exactly what he was going to say next. Unfortunately it cost me the power of speech, so he said it anyway.

"It's the *New Frontiers*."

I suppose a similar effect could have been achieved by turning every other atom in my brain to antimatter.

"Your father meant for you to be a rich man, Joel," Hattori's voice said from the far side of the cosmos. "Now you are. All shares have been reactivated, and you have a *lot* of them. Should you choose to, you could become one of the *Sheffield's* biggest investors . . ."

I began to laugh. Then I laughed some more, after which I kept on laughing, and finally realized I was not going to be able to stop anytime soon. I was on the floor by then, in fetal position, Hattori fussing futilely over me, and I discovered that I could convert the laughing to crying for minutes at a time, which was a change at least.

All I kept thinking was that I had abandoned everything there was, left everyone I knew, burned every bridge ever built, and literally fled the Solar System on a one-way trip, to escape the dread danger of becoming rich. . . .

Some days, you just can't lose a buck.

I had to do some fast talking to get out of Hattori's office without being reported as emotionally unstable and sent for therapy. I'd freaked him out a little with my outburst of hilarity. And I had to edit what I said on the fly, too: if I had tried to convince him I'd been betrothed to a niece of Conrad of Conrad, he'd have been *certain* to send for a counselor. Especially once I told him I'd broken the engagement.

But after hearing a version of my recent history that dialed Jinny back to "a girl from a very wealthy family," he finally agreed that hysterical laughter was an appropriate response to the way things had turned out, and stopped physically recoiling from me. He even had the grace to postpone picking my pocket, urging me to take my time, and come back for further discussion of my participation in the colonial partnership when I'd had a chance to, as he put it, "encompass everything."

I thanked him and left, with every intention of finding Herb and asking him to be my designated keeper while I got hammered. If he was not interested, Balvovatz or Pat would do. And if none of them were available—well, I had survived a solo bender in Vancouver, a very tough town. I could probably handle the *Sheffield.*

But halfway back to my room I remembered that I had already *done* so. More than once. For most of my first week aboard, actually. Nobody had reported me because—well, a *lot* of us had spent some portion of that first week drinking or smoking or snorting more heavily than usual. But if I were to start back up again after only a day of sobriety, eyebrows would be raised, and sooner or later someone would mention my name to the Healers. I was damned if I wanted to waste hours explaining myself and my decisions to some well-meaning headcandler, who might take it into his head to start messing with my brain chemistry. Ganymedeans didn't hold much with that sort of thing.

So I did the sensible thing instead, and didn't get hammered.

That was a pity, because then I had no excuse at all for the fistfight. Or my miserable performance in it.

The way I remember it, I plodded back to my room in a fog, like a cow on its way back to the barn, so confused by my own thoughts that I could barely lift my feet. And then I raised a weary arm and palmed my door open, and there were these two guys.

You know how sometimes you'll meet a stranger, and it's as if a closed caption appears at the bottom of the screen, summing them up in a word or two for those who just tuned in? "Professional victim," or "Could bore the balls off a buffalo," or "Wants money," or the like? My first sight of these two went freeze-frame for a second, and below each of them I clearly saw the subtitle "Perpetrator." Only after the action restarted did I notice their armbands, and realize I was meeting my first transportees.

They were big guys, too. Bigger than me, anyway. They didn't look sophisticated enough to be political prisoners or incorrigible monoreligionists. The one sitting on Pat's bunk had the arms, shoulders, and thighs of one who lifts weights regularly and faithfully while he's in jail, but has been out for some time now. He had short black hair just beginning to thin and a short sanitary sideless black beard, of the type called a "doorknocker." He had a glass of some dark fluid cupped in his right hand, and took a quick pull from it when he saw me—but he didn't drop his eyes.

His partner, sprawled on Balvovatz's desk chair, looked more as if he tended to win his fights by knowing more dirty tricks than the other guy. He had the body of a high school sports star . . . who had been expelled before graduation, and had expended as little effort as possible ever since. Instead of pumping iron when in jail, he just hung out near his friend. He wore his dirty blond hair in an arcane style that involved grease, and hinted that it came from a motorcycle or copter engine. There is no name for his beard type, nor is it likely any will be needed. Sweeping scimitar sideburns failed to reach *quite* as far as his mustachios . . . which did not descend *quite* far enough to reach the goatlike goatee. The net effect was of a satyr too dumb or drunk to realize his gay barber is making fun of him. He was as unguardedly furtive as his friend was poker-faced. That caused me to notice that Balvovatz's desk monitor was darkened, not switched off.

"Oh, hi," he said, too heartily "You're back."

The one on Pat's bunk said, "We're real sorry to barge in like this, okay?"

"Yeah, but everything's totally cool," Weird Beard said. "Nothing to freak out about."

"How did you two get in here?" I asked the dark one sitting on the bunk.

He shrugged, being careful not to spill his drink. "Everybody's got things they're good at," he said reasonably.

I nodded. "And this is okay with me because . . ."

The other one said, "Because this is one of those fuckin' situations where, you know, like it says upfront, viewer discretion is the better part of value."

His friend stared at him, took a deep breath, let it out, and turned back to me. "We have a proposal for you. A business opportunity. Joint venture. Low risk, high return. But yeah, Richie's right, it's definitely what you'd call a little gray-market."

Well, I thought to myself, you happen to catch me at a moment when I have a few gigabucks I need to invest somewhere. "How gray?"

"Just barely beige," Richie said. "And only right at the end. Up until then it's mostly red, and some green. Tell him, Jules."

"Richie, will you take it easy? Joel—can I call you Joel?—it's real simple. You work down on the Farm Decks, right?"

I agreed that this was sometimes so.

"Dirt or High Japonics?" Richie asked.

I looked at Jules. Jules looked at me and his face said, *What am I* supposed *to do?*

"Both," I said.

"So you like to make stuff grow," Jules suggested.

"Like you said, everybody's got something they're good at."

"And you know your way around down there. Like, where things are, what parts get looked at all the time, what parts don't get looked at so often."

Light was beginning to dawn. "Why?"

"We got some stuff we'd like to grow."

"Without bothering the Zog with a lot of fuckin' paperwork and formalities," Richie put in.

"And we figure a smart guy like you could work that out."

I closed my eyes. The world spun as if I were drunk. But the moment I opened them again, it *slammed* to a halt. "What sort of plant are we talking about?"

"Just flowers," Jules said.

"Herbs," Richie amplified, pronouncing it like my roommate's name. "From the country."

" 'Erbs," Jules corrected, glaring at him.

"Well, sure, *now,"* Richie said, annoyed. "But *originally* they grew it in the country"

Jules and I exchanged another glance, and he took a deep pull on his drink, wiping his mouth with his wrist. *YOU wanna try it?*

"Richie," I said gently, *"which* Herb, exactly?" I pronounced it like my roommate's name, and Jules nodded. *That's the way to deal with* him. Richie frowned. "Look, if you're gonna get all technical on me—just because I haven't got my grade eleven, you—"

I turned back to Jules. "Why don't you tell me which flower you mean?"

He looked me in the eye. "Poppy flower, okay?"

I took in a deep breath, and then when I was done, I found more room in my chest somewhere and took in a lot more breath. "Get the hell out of my room before I call a proctor," I said, loudly enough to use up a lot of it, and began exhaling the rest.

Jules didn't move, or even wince. But Richie came up out of Bal's chair like a boxer out of his corner, yelling something of his own—

and then a whole lot of things happened too fast to grasp—

and then a proctor with somebody's blood on his tunic blouse was holding me gently but firmly by the upper arm, a really nice guy from the smile on him, and offering me a mood elevator. That sounded like a great idea; it was only after I let him put it under my tongue that I realized the elevator's cables had been cut, by my anemones. It got exciting then for a few years, but fortunately the basement, when we reached it, turned out to be made out of marshmallow, and I decided it was safe to take a nap after all.

Not really.

I walked corridors for a million years. The same ones, for all I know. I didn't mind. I wasn't tired. I wasn't even bored. Funny things kept happening as I walked. Silly-funny. A cat danced with a fire extinguisher. Doors grew phallic knobs, then dilated and swallowed them. The floor was furry beneath my bare feet, then grassy, then hard and cold as ice. A section of pale yellow wall started to melt like frozen urine from the heat of my passage—nothing odd there, but it ran up instead of down. *Less* than zero gee whiz. It started to collect overhead, but I ignored it and walked on. Goats sang harmony—in Rabbit rather than Goat, a ludicrous choice. A bubble began to keep station on me, ahead and to my left, and inside it grew a hobo, a lifesize headshot. It was Jinny—hundreds of years older. She smelled like fields of barley, light as flax. Her face was in ruins, beyond the power of even power to save. Her hair was still widely red, but often misunderstood. Her eyes were hazel, stoned, rolling. Then Ganymede devalued the debit, the economy went bad, and her bubble burst. Well, at least the goats finally got their butts out of their heads and started singing in Goat. I began to encounter members of a race of Easter Island statues, huge mouths gaping like Art Deco urinals, making fluttery sounds like pigeons as I went by.

Then one short one blocked my path, and turned into my roommate Pat. "Joel?" he asked me. I waited with interest to hear the answer, but it didn't come. He asked if I could hear him, and after considering it, I said, "Sometimes." A pigeon fluttered, and Pat said loudly, "Just a moment, please, Proctor," and then softly, "Take this." A piece of notepad paper, folded three times. He folded my fingers around it, used them to tuck it into my breast pocket. "A time will come for you to speak," he said, very quietly, but with an unmistakable urgency that reached me in my fog. "When that time comes, say exactly what is on that piece of paper, and nothing else. You hear me, Joel? Say it back to me."

I nodded. "When it's time to talk, say what's on the paper, just that."

He nodded back. "Okay," he said loudly, and was dissolved by the sudden strong tide that swept me forward. I remembered that I should have told him about his bunk being destroyed. Instead I tried to interest the goats in a strained pun about a farmer who cared for seven or eight goats, even though he never cared for chevon or ate goats. It shut them up, at least. I trudged on in comfortable silence until I came upon my mother. I knew her at once, and was delighted to learn what she looked like, how she moved, how she smelled. It was only when I saw the concern in her troubled eyes that I began to realize how much trouble I must be in. That made me dizzy, and I told her so. She said I could sit down, so I did, and by the time I realized she'd meant I should sit in some chair somewhere nearby it was way too late. My tailbone hit the floor with a crash, angering the floor so much it reared up and smacked me on the back of the head. It burst, like Jinny's bubble had earlier, disintegrating me just as effectively.

Ten

No, no, you're not thinking: you're just being logical.
—Niels Bohr

I was wide awake and clearheaded. I was in an absolutely anonymous cubic, a generic plasteel box of air, about the size of a small studio. Its only features were doors at opposite ends, generic chairs, and a monitor. I was seated on one of the chairs, facing one of the doors, the monitor on the wall to my right. Seated facing me was Solomon Short. Behind him was another man I did not know, who sat facing the monitor and seemed absorbed in it. My tailbone hurt, quite a bit, and so did the back of my head, but I did not mind much.

"Do you accept me as your Advocate, Joel?" Sol asked me. I blinked. "Sure."

"I understand Pat has given you your lines."

I remembered what he must mean, and patted my pocket; the folded note was still there. "Yes."

He nodded, and gestured to the monitor. "Stick to the script. Now pay attention to that—"

The screen showed a room larger than this one. At its far left, three people sat behind a long table on a short shallow stage. On the right three mailer tables faced the stage, with people seated at them, one at either end and two at the center table. They were the only ones I recognized: Richie and Jules. "Is this realtime?"

"Yes."

Oh, fine: they got to tell their side first.

"Closest to us on the left," Sol said, "is Coordinator Merril Grossman, representing the colony. Beyond her is Magistrate Eleanor Will, and after her is Lieutenant Frank Bruce, Third Officer, representing the crew. With me?"

"So far."

"Good man. Nearest to us on the right of the screen is Prosecutor Arthur Dooley, representing the Covenant. Look him over carefully. I believe you've met the next two, transportees Butch and Sundance. Beyond them is their own Advocate, Counselor Randy Lahey." He spoke over his shoulder. "Sound please, Tiger?"

The man addressed, a Japanese of great grace and dignity, lifted a remote control he hadn't been holding a second ago, and turned up the volume on the scene we were watching.

Coordinator Grossman was speaking. ". . . chance to rebut or amend afterward before this recording is formally entered into evidence. Do you both understand?"

"Sure," Richie said sullenly "If it's bullshit, we can tell you after, I got it. Only I'll tell you right now, it's bullshit."

His partner Jules threw him a glare. "We understand, Your Honor." I noticed that his right hand, under the table, visible to the camera but not to the panel onstage, held a half-full drink.

Dr. Will, a striking slender brunette with skeptical eyes, spoke up in the formal tones of one reciting ritual for the record. "The *Sheffield's* AI began this recording when one of you spoke one of its trigger phrases, `gray market.' Under the terms of the Covenant, the recording was brought to official human attention only upon the observed commission of a breach of peace which occurs several seconds in. It is that breach with which I am primarily concerned today."

I was delighted. If there was an audiovisual record of what had occurred, I had nothing to worry about—and Jules was going to need whatever he had in that glass he was always holding. I could remember everything that had happened, very clearly. Well, clearly. Clearly enough. The broad outlines at least.

Let's see now. Richie and Jules had confessed that they were trying to recruit me into a conspiracy to traffic in heroin, or morphine, or possibly opium. Any of the three was an offense not merely detainable but serious enough to get one sent to Coventry . . . in jurisdictions where one existed. On a starship, for all I knew it was a spacing offense. Naturally I had been angry and afraid. I had asked them to leave my cubic, and had been ignored. When I tried to urge Jules toward the door with a hand on his shoulder, Richie had abruptly attacked me. Releasing a lot of my own pent-up frustration, I had admittedly overresponded a bit, knocked him all the way across the room—back onto my own bed, destroying it. Then Jules had sucker-punched me from behind, and we'd all ended up entangled on the deck, where I'd managed to keep them both restrained until the proctors arrived.

Yep—that was everything. I realized it was a bit unusual for someone of my size, mass, and background to make such easy work of huge bruisers like those two, so I was glad to know a visual record existed to back up my account.

"Sheffield, please begin playback."

"Yes, Magistrate," the ship said.

I settled back to watch myself in action.

. . . *"gray-market,"*Jules's recorded voice said.

"How gray?" I heard myself ask after a pause that now seemed to me incriminatingly long.

"Just *barely beige,"* Richie answered. *"It only gets black for a day or so right at the end. Up until then it's mostly gray, and some green. Tell him, Jules—"*

That's odd, I thought. Poppies aren't black at any part of their life cycle. Or gray, or beige. I'd grown them for the Lermer City Hospital, back on Ganymede. They're extremely colorful flowers, which ultimately yield a white or pale yellow seed pod that oozes a white sap. How could a drug dealer know less about his product than I did? Or was Richie simply talking through his ass?

I glanced at Sol when Richie's "High Japonics" line came, expecting to share at least a grin if not a chuckle. I was sure it would delight him. He didn't crack a smile.

Solomon short failing to find humor in a situation was so out of character, I was still puzzling over it when I suddenly realized the crux of the whole matter was approaching, and resumed paying close attention. Here came the sentence that would exculpate me. My heroic battle scene would not be far behind.

Richie's voice blathered something about his grade ten. My own voice asked Jules, "*Why don't you tell me which flower you mean?"* Here it came

"Happy Hour," Jules said.

My jaw fell. I was so shocked, I stopped paying attention to the events unfolding onscreen. Someone had to have altered the recording!

"Sol—" I cried.

"Shush," he said loudly and firmly. "Reserve your questions and observations."

"But damn it, he said—"

"Pipe down, I said!"

Damn it to hell, he'd said *poppy flower,* not *happy hour*.

Developed in one of the L-5s—all of them publicly disavowed blame and all of them privately claimed credit—Happy Hour was a flower whose leaves contained a mildly entheogenic alkaloid just slightly stronger than marijuana in effect, and no more habituating. It was about the opposite end of the spectrum from opium poppies. It just barely qualified as a restricted drug on Terra, and there were jurisdictions—among them Ganymede—where its use was legal. I had no idea what the *Sheffield's* policy on it might be. There were shouts and other loud noises from onscreen, but I was oblivious, aghast at this unexpected turn of events, trying to reconcile the impossible. The only rational explanation was that someone, somewhere, somehow, had been able to corrupt the *Sheffield's* AI. If so, I was about as screwed as screwed could be. I began to panic. "Sol, you have to listen to me!"

"I know," he agreed, eyes on the screen. "Isn't it terrible?"

"But I—",

"Don't call *me* Butt-Eye," he said, and used the remote to raise the volume enough to drown me out.

It wasn't easy. The fistfight playback had finished while I was distracted, and the sole audio output now was the soft voice of the magistrate. But Sol mashed down on that volume-up button, and only backed it off when I resumed paying attention to the screen.

And found Dr. Will in mid-lecture, a more-in-sorrow-than-in-contempt tone in her voice. "—even mention your ridiculous attempts claim your names were actually Corey Trevor Jay Rock."

"I told you, it was a fuckin' reflex—" Richie said off-camera.

"However," she went on determinedly, "this court does take notice of your special request regarding language, and reluctantly agrees with your argument that for you to defend yourself adequately you must be allowed to use your own natural idiom. To require you to use my vocabulary would be a distraction roughly equivalent to you asking me to speak to you freely and eloquently . . . without ever using any words that contain the letter 't.' I rule that you—only you—may use profanity in my court."

"Wow. Thanks, Your Magistrate, that's really fuckin' awesome."

"Richie," Jules began.

"Well, it is," Richie said. "Okay, so you saw it. That dick got all pissy for no reason, and started talking about proctors and shit. Well, I'm already on probation, like you pointed out before, and who's a proctor gonna listen to, me or some citizen? So I got mad and told him he was being an asshole, 'cause he was. And what does he do? He punches me in the face!"

No. That wasn't possible. Surely I hadn't—

Dr. Will said, "At that point, a proctor would have seen your face and his knuckles and believed you. Why didn't you call one?"

"Well, I would've got *around* to it," he said defensively "I was kind of fuckin' busy just then."

"Busy whacking him," Jules muttered.

"I was trying to, like, knock his punches aside," Richie insisted. "So I kept missing. Big fuckin' deal. What am I, a boxer? Anyway Your Wordship, my point is, after that the whole thing kind of got out of hand and nothing that happened was really anybody's fault, and the stuff that *was* somebody's fault wasn't really, so much, because all of us were full of shit, so what I say is, why don't we let water under the bridge lay where Jesus flang it, and just forget the whole thing? That's fair."

Jules said, "I hate to admit it, but he's right, Your Honor. It's a wash. No harm, no foul."

Dr. Will sat breathing through her nose for a while, looking at the pair of them. Finally she said, "Here is my judgment. You will both apologize to Mr. Johnston for invading his privacy, disturbing his harmony, and ruining his furniture. You will repair the damage yourselves. For the next month you will each be confined to your quarters whenever you are not either working or eating." She closed a folder that lay before her. Richie couldn't believe his luck. "That's it?"

She cleared her throat meaningfully, and his grin vanished. "I would be considerably harsher," she assured him. "But the Sheffield's Senior Healer, Dr. Lewis, has advised me that she considers moderate recreational use of happy hour acceptable on this voyage, and the Captain concurs. Neither of you knew that when you approached Mr. Johnston—but it was a fact all the same. You have narrowly escaped serious sanctions. Consider yourselves lucky that camera's microphone did not malfunction."

"We do. Thank you, Your Honor," Jules said at once. "Let's go, Rich."

They both got up and left the frame, and a few seconds later, the door I was facing dilated, and they both came out together, accompanied by Lahey, their potbellied Advocate. They were striving hugely, and without much success, to suppress grins big enough to frighten a hired killer or even a real estate agent. When they saw me, their grins did not falter, just became more wolflike somehow. "Hey, Farmer Brown," Richie called. "Knock knock."

I was so confused and demoralized I played along. "Who's there?"

"A fucked-in-thehead dipshit with manure on his shoes who goes around punching people 'cause he doesn't know his ass from his elmo," he said triumphantly.

I opened my mouth . . . but if there is a comeback to that remark, I still don't know what it is.

"Good luck in there, arsehole," Jules said, and took a sip of his everpresent drink. I hadn't noticed it on the monitor, but he had it now. "Come on, Rich, let's go." They both walked boldly through us, making us step out of their way, and left through the door behind us.

"You have your lines?" Solomon asked again.

I started, and patted my breast pocket. "Damn. I should have studied them—"

"Too late now," he said. "Let's go."

I soon found myself in a surprisingly comfortable chair, facing The Three Bears.

To the left sat Coordinator Grossman. She wasn't *that* big, physically. But she was a little bigger than the human average in all dimensions—and more important she was one of those largerthan-life people who can dominate any room she cares to. Right now she was just observing, but she was doing even that with gusto, with appreciation, hoping I would prove entertaining.

Directly ahead of me was Middle Size Bear, Magistrate Will, average height and mass. On the monitor outside her eyes had seemed skeptical. Now they were more ... knowing. Mothers always know what you're thinking, I've been told. Until you reach a certain age, anyway. Apparently I hadn't reached it. I was glad there was a third bear because it gave me a reason to pull my eyes away from hers—

--and then was sorry I had. Littlest Bear, Lieutenant Bruce, was really more of a bantam rooster. Most small men learn to deal with it, but if they get picked on enough, early enough, sometimes they never do get over it. He was permanently pissed off at everyone. And me he was *allowed* to be pissed at. I tried not to look, and failed, and sure enough, his feet did not quite reach the floor, even with the lifts he was wearing. And he caught me looking.

"Good afternoon, Joel," Dr. Will said.

I turned back to her and opened my mouth, and only then realized that every molecule of moisture in my oral tract had gone someplace else.

I made a faint croaking sound. Solomon said, "Good afternoon, Doctor," and gestured to someone outside my peripheral vision,

"You speak for Citizen Johnston, Dr. Short?" Lieutenant Bruce asked, surprised.

"Yes, Third Officer."

A bottle of water was put before me. Once again, I was glad—but only momentarily. The instant the first sip touched my lips, I suddenly knew exactly where all that missing moisture had gone to, where all the moisture in my body had gone to.

Use of his honorific had pleased Lieutenant Bruce. "Do you mind if I ask why, Dr. Short?"

"He plays the saxophone, sir."

This response clearly baffled Bruce. He wanted to find it contemptible—but even he couldn't be contemptuous of a Relativist.

Dr. Will cut in, and *again* it was one of those glad-but-only-for-a-second deals, because with her first words, I realized she was speaking in courtroom tones. "Joel, we're here to adjudicate the events that occurred in your quarters earlier this afternoon. First we will establish what facts we can. You will have an opportunity to explain, interpret, argue, or rebut, afterward, but please reserve your comments if any until we've finished examining the record. The Sheffield's AI began saving this recording when one of you spoke one of its trigger phrases, 'gray market.' Under the terms of the Covenant, the recording was brought to official human attention only upon the observed commission of a breach of harmony which occurs several seconds in —"

Oh, shit, here we go, I thought. Okay, okay: when it gets to the crucial point in the playback, they'll all hear how *close* it sounded like "poppy flowers." They'll see how it was an honest mistake.

The playback began on the monitor before me, with a peripheral echo over on Prosecutor Dooley's table.

And of course they'll agree that if somebody had *been* trying to peddle poppy products in a small society like this one, they should have been spaced. Anybody might take a poke at guys like that, before getting control of their emotions.

Reluctantly I admitted to myself that onscreen, they did not look particularly like villains. They looked like idiots—somehow still optimistic enough to think they might put one over on The Man despite a consistent record of failure. Worse, they were clearly harmless idiots, not nearly as menacing as I remembered them.

Richie said his High Japonics line again, and Sol brayed with laughter, even though he'd heard it already, outside in the anteroom.

Then the recording reached the point at which I'd heard "poppy flower," and what Jules said onscreen now sounded nothing at all like "poppy flower," it was clearly and unambiguously "Happy Hour," and nothing else.

And then nothing that followed was as I remembered it. I watched in growing dismay at what resembled nothing so much as a performance by an ancient comedy team called The Three Stooges.

I did not land a single punch. Nobody did. I was the only one who even tried very hard.

The me-onscreen cussed Richie and Jules out, and told them to get out of his room or he'd call a proctor. Richie jumped up indignantly, shouting, "Hey, fuck that, I'm on probation, okay!" He put a hand on my shoulder—to turn me around to face him, so he could argue more effectively; it was quite clear he wasn't attempting a sucker punch. And I tried to spin on my heel and punch his face in. And tripped over my own feet and missed by a kilometer and fell heavily into him, staggering him a little. And behind me, Jules tried to step forward and pull me back by the collar, except the place he planned to put his foot turned out to be full of my tangled ankles, so he tripped and fell into *me.* That tipped Richie the rest of the way over backward, and we all crashed onto Pat's bunk together, tearing it right out of the wall and dropping us to the deck. Richie and I both got the breath knocked completely out of us, but Jules was able to rise far enough to reach a musclebound arm up and grab hold of my bunk, which promptly also tore out of the wall and whacked him hard enough on the head to knock him cold. It drove his head forward and down, so it slid off the *front* of his head, and landed edge-on on the middle of Richie's contorted face, smoothing it out completely, at just about the same instant that Jules's kneecaps impacted both of my kidneys. Then it fell over onto the back of *my* head, and Jules's face landed on it. And then we all were very quiet and still ...

"Do you wish to see the recording again, Joel?" Dr. Will asked.

My mouth had once again become dry as a balance sheet. I shook my head no, reached for my water, and allowed myself the tiniest possible sip.

"Is there anything you wish to say on behalf of the colony, Prosecutor Dooley?"

"No, Doctor. I believe what we've seen twice now speaks for itself."

"It certainly does," Bruce muttered sotto voce.

"Joel, if there is anything you would like to say, now is the time."

Oh. Oh. I was ready for this one. Thank you, Pat! I fumbled at my pocket, took out my lines, tried to unfold the paper under the table unobtrusively, so it wouldn't be totally obvious I was using a crib sheet.

And when I had it open, the damned thing was blank.

I looked at Sol. Sol looked back at me. I looked down at that piece of paper. Then I looked back up at the judge and shook my head no.

She merely nodded, but her mouth changed slightly in a way that gave me the impression my response pleased her for some reason. "Anything to add, Advocate Short?"

"Yes, Doctor," Sol said. He tapped a few keys on the table's terminal. "You will all find my representation before you. It speaks to certain facts and circumstances which I hope you will agree are mitigational in this matter."

As all three looked down at their screens and began to read, I looked at ours, but it was blank. I looked at Sol. Sol looked back at me. I faced forward and waited. "I see," Magistrate Will said after a few moments. "Thank you, Advocate."

Coordinator Grossman was next to finish reading; she sat back, turned her head five degrees to the right, and studied me, frowning slightly.

When Bruce spoke, there was something odd about his voice. "You appear to have been under a great deal of stress lately, Colonist." It took me a moment to identify the subtle change in his tone. He was addressing me with respect. It confused me so much, the interval into which I could have inserted a response passed before I could think of one.

Dr. Will polled her companions by eye. There was some brief silent communication I didn't get. "Very well," she said then, and fixed me with an eagle's remorseless gaze. "Citizen Joel Johnston, physical violence aboard this ship is intolerable. You have damaged fellow citizens and colony property without cause. Examination suggests that you may have done so because of situational emotional imbalance, and possibly perceptual error, rather than from an unhealthy belief that you are entitled to correct the moral lapses of your fellow citizens with assault. Therefore, this matter will be held in abeyance indefinitely. You will not be required to accept remedial neurochemistry at this time. You are released in your own recognizance, on the conditions that, first, you enter treatment immediately, and satisfy all requirements of your chosen Healer to the best of your ability, and second, you either make peace with Transportees Bent and Rafuse, or mutually file a standard hundred-meter restraining order. In addition you are fined their medical expenses, and the cost of materials for repairing the physical damage to your quarters."

"Do you understand all that, Joel?" Grossman asked. Her voice was deep, raspy, kindly. "Settle the score, bury the hatchet, do as your Healer tells you, this all goes away and you get to keep on being who you are right now. Otherwise your brain chemistry gets readjusted until you're fit to live with people. It's our only choice, I'm afraid: we have no Coventry aboard."

I stood there listening to the blood in my ears until Bruce said, "Is there anything you wish to say for the record, Citizen Johnston?"

I looked at Sol. Sol looked back at me. I looked down at my crib sheet, and it was still blank. I looked up at the panel, and found that there was enough moisture in my mouth to permit speech, and that decided me.

I said, "Thank you," to Magistrate Will, and "Very much," to Coordinator Grossman, and "All of you," to Third Officer Bruce.

All three gave the same inclined nod of polite acknowledgment. All three stood up. So did Sol. So did Prosecutor Dooley. So, finally, did I. "Hot jets, Citizen," Dr. Will said formally

"C-clear skies," I responded automatically, but she had already spun on her heel and left, followed by her fellow panelists.

I turned to Sol, and found him beaming at me. "Some people are *really* hard to drag to a shrink," he said. Then his expression changed slightly "Whoa, now. Okay. Let's sit down and have a nice drink of water. That's better. Now a nice deep breath. Hold it for a moment. That's it. Let it out. Wait. Deep breath again. Hold. Release. Hold. You've got it. A little longer each time." The breathing thing was very hard to do, but soon it did start to clear my head a little. My heart was pumping a klick a sec. I felt like I was on the Upper Farm Deck: the temperature seemed to have shot up five degrees. I was pouring with fresh sweat from head to toe.

"Idiot," Sol said, shaking his head. *"Before,* you sweat."

"I don't know why I hadn't figured it out for myself, but I hadn't," I said. "I'm usually much quicker on the uptake, but it never occurred to me I was in danger of being put on neuromeds until she said I wasn't anymore. It's kind of a phobia of mine, having my personality altered by someone else. You probably think Ganymedeans are backward primitives in that regard, but—"

"It is precisely because I share your unconventional horror that I chose to act as your Advocate."

"Sol—"

"Don't thank me until you hear my fee. I want a new composition. It has to be at least fifteen minutes long. It can have anything you want in it as long as there's a lot of sax, baritone. Theme, style, tempo, key—all up to you. And it has to have my name in the title. You have until we reach our destination."

I looked at his goofy kindly smile for a long moment. "Sold," I said finally "Thank you, Solomon."

"Don't forget to thank Pat for writing your speech. You delivered it eloquently. I might almost say movingly."

"I won't. Which one of you put the other up to this?"

He was gone like the Cheshire Cat, leaving behind only a ghost of his dopey grin.

Eleven

Life is painful; Suffering is optional.
—Sylvia Boorstein

My Healer said, "Will you excuse me for just one moment, Joel?

"Of course, Dr. Louis," I said, and she put her full attention on her screen for a few moments, keying in an occasional input. To pass the time I examined her office, a fairly large cubic, soothingly furnished, gimmicked so that no matter which way you looked, the light was never directly in your eyes.

Suddenly I burst out laughing. A small outburst, easily suppressed, but audible. She looked up and met my eyes again and smiled faintly "You got it, did you?"

"Just now," I agreed.

Behind her, a midsize image hung framed on the wall, a rather striking photo of a large lizard, of a breed that had adapted better than anyone had expected to Martian conditions and was now considered a minor pest there. I had noticed it when I'd come in, but it had taken until now for my memory to yield up the odd name of that odd creature Gila monster. It was a visual pun. She was the Healer monster.

"That's about how long we've been around," she said.

"Healers?"

"Meddlers. Busybodies. Pains in the ass. Healing is merely one of the few remaining socially acceptable excuses for poking one's nose into another Citizen's affairs. Excuse me again for just one moment."

She went back to her screen, and this time I decided to pass my time by studying her more closely instead of the room.

She was perhaps twice my own age or a bit more, I guessed, of average height and weight, and looked healthy, fit, and content with her life. In another context I'd have called her attractive for her age. She wore her brown hair short, so nothing obscured any part of her face. In its various contours and configurings I found evidences suggesting decency, kindness, patience, considerable humor . . . and beneath all these a strength, or perhaps simply a determination, so awesome even in repose I had the crazy idea that if she were ever to go out the airlock, get a good grip on the frame, and plant her feet on the vacuum, the *Sheffield* would slowly come to a halt. Her clothing, however, was slightly more casual and comfortable than many would have deemed appropriate for our situation, indicating that the strength was not the kind rooted in iron stupid discipline.

I glanced around again. A pair of flat images on the side of a bookcase caught my attention, precisely because they seemed so pointless. Each photo had been cut out of a magazine or other hard copy and put there with pins. The one on top was of a donkey, or burro. Below it was a medium shot of a golfer lining up a putt. And just below them both was a line cut from some advertisement: *"For those who* know *the difference!"* If there was a point to the arrangement, it eluded me.

"Thanks for your patience."

"No problem, Dr. Louis."

"Call me Amy, please. Joel, I think there are four questions you urgently need to consider."

"That many?" I said sourly

"I don't think you've thought through any of them yet." Perhaps my least favorite criticism; I swallowed a comeback. "And you must. They're all very important."

"Somehow, Amy, I have an idea you're going to tell me what they are soon."

She shook her head. "Not if you're going to get cranky right at the jump, just because I said you have some thinking to do. If you like, we can spend this whole session dicking around. But we're going to get to it eventually. Suit yourself."

I think if she had looked back down at her screen, I would have gotten up and left, then. But she didn't. She just kept looking me in the eye, waiting, not offended by my antics, just waiting patiently until I decided to move on instead.

"Hell of a thing to say to a man, that he doesn't think things through," I grumbled. But it was clearly a backing-down grumble.

She nodded sympathetically. "It is an embarrassing thing to be caught at. But, Joel, face it: you're *caught.* Your presence here is not voluntary, remember? Ergo, you have screwed up *big-time.* The embarrassment is one of the smallest things you're going to have to deal with."

She paused, visibly giving me a few seconds to see if I was going to jump salty again.

Well, God damn it, Joel, is she right or isn't she? Can you face facts, or not?

"The majority of clients I deal with have been driven into this room by their own egos. You have not, for once, so I don't want to waste as much time dealing with yours. Can we simply assume goodwill on both sides, and start with the basic agreement that you need help, and that I may have some?"

The stars themselves knew I needed help. And I knew she had some. I'd known that before I'd gotten from her door to the chair I sat in. "I guess. . ." I began.

And a stuck switch somewhere in my brain went spung, and I burst out laughing—a hold-your-belly-and-fold-over guffaw.

She was not offended in the least, just surprised. And interested. I wanted to explain but was laughing too hard. But she was in no hurry. Finally I got enough air to hoot, "I do! . . . I do! ... Honest!" which only further confused her until I was able to get one arm free and point to the clip art pictures on the side of her bookcase that had puzzled me earlier. "I do know!" At once she began to laugh, too.

I *do* know the difference. Between my ass, and a hole in the ground. "Sometimes, anyway—"

She had a great braying loon hoot of a laugh, and knew it, and was not at all selfconscious about it. So we had us a good one. By the time was done, I was pretty sure I trusted her. It's humorless people who frighten me, because I can't begin to understand them.

At last I said, "I'm sorry, Amy. Please tell me the four questions you think I need to address first."

She nodded. "Who. What. Where. Why."

I blinked. "Not 'when'?"

She shook her head. "The answer to that is always 'now—I took a deep breath. "In that case, let's do it."

"First, 'who.' That's almost always a good place to start. Who are you? Not, who did you plan to be, or who are you expected to be, or even, what would you like to be. Who are you? Who the hell is this Joel Johnston, when he's at home? I don't think you know. And I'm certain I don't. It would be a useful thing to know, don't you think?"

I was past sarcasm or irony. "Yes, Amy, it would." My voice was hoarse. From the laughing.

"Next, 'what.' What led you to this place? To this ship, this twenty-year voyage to the back of beyond? What led you to abandon literally every single thing you've ever known except the concept of associating with other humans? Why did you leave the world, leave the rest of the race, leave the Solar System, for good? This is probably the question you think you know the most about, and I'm pretty sure you're wrong. Or only part right."

It was a broken heart! Wasn't it?

Wait. Had I expected heartbreak to be *permanent?* Did I really intend to die a virgin? If my Jinny was not to be with me, nor I with her, how was it any better if she was eighty-five lightyears farther away?

"The third question, 'where,' might actually be your best place to start. Where are you going? I mean that not rhetorically, but literally"

I didn't understand. "Literally? That's easy. To Peekaboo Two. Brasil Novo, if you want to be formal. The second planet of Immega Seven-Something."

"Tell me about it."

"Huh?"

"Tell me about the planet. When it was discovered. Its physical parameters. Its atmosphere. Its geography, and geology. Climate. Seasons. Flora. Fauna. Most intelligent-seeming organism identified. Most dangerous-looking predator identified. Intended location of our First Landing site." She paused expectantly.

"Uh . . . it's real hot and damp, for . . . for extended periods, and there's a whole lot of oxygen," I said, and realized with dismay that I had shot my bolt.

"You're going to spend twenty years getting there, and you'll stay there the rest of your life. I would spend some of the twenty years studying just what you've gotten yourself into."

All at once I felt immortally stupid. She was absolutely, shockingly right. Not thought this through? Hell, I hadn't *started* thinking. Look before you leap, my father had often said. I hadn't even looked *after* I'd leapt. After weeks on board a starship, my principal curiosity about my destination so far had consisted of wondering what to wear to work on the Upper Ag Deck. I had just sort of assumed there'd be a planet of some sort at the end of this, and what of it?

Could a broken heart cause brain damage? On this scale?

"Finally, why. Once you know the destination, the question becomes, why are you going there? Why go anywhere, for that matter? For what reason? What will you do there? Above all, why will it *matter?* Here, take these. Basket over there."

I accepted the box of tissues she offered out of politeness, and was startled to discover that my face was soaking wet and I really did need to blow my nose. The wastebasket had been placed so that it was a hard shot to miss. I hit it six times running before I was done. By then I was seeing little black spots overlaying everything.

"So that's it?" I said, my voice quavering. "That's everything? Shit, I thought I had a problem."

"You do," she said simply. "And that is a *lot* to chew on. So much that twenty years might not be enough time. And I promise you it will be painful. And you may fail completely. Would you like the *bad* news, now?"

I giggled. "Sure."

"You have no fucking choice."

"Tell me there's good news." I tried to parody desperation, but did too good a job.

She smiled. "You have the best Healer on the ship. I will give you some good tools, and yell encouragement, and take your crap, and share your breakthroughs, and tell you when your exciting new profound insights are horseshit."

"Tools?"

"Techniques. Disciplines. Attitudes. Drugs. In addition, I will listen to anything you want to tell me, and give advice if I happen to have any."

"That sounds good," I said. "When do I start?"

"Now."

"Okay. *How* do I start?"

"First, you have to stop."

"Stop what?"

"Everything."

"Huh? I mean, Crave pardon?"

"To grow, you must learn about yourself. To learn, you must listen to yourself. To listen, you must first learn the hardest trick of all: to shut the hell up."

I was so startled, I did. And then realized it would have been a not unclever reply, if I'd done it intentionally. So I tried to pretend I had, and made an elaborate show of obligingly cocking my ear to listen to some imaginary sound, and then tried to pantomime hearing some transcendent insight. She just kept looking at me with no expression, and suddenly I had a sense of seeing myself from the outside, watching myself mug and fidget. And *finally* began to get a sense of what she was driving at. I let my face go as blank as hers, took a deep breath, and tried my best to listen. To myself . . . to her . . . to whatever. After a few seconds I closed my eyes to help myself concentrate.

I don't hear a damn thing/wait/is that the air *circulator?/it's gone now/this* is *silly/really silly/stupid* kid's *game/hide and go* fuck *yourself/wait, now/a* hum/a *note at the very upper* limit *of audibility, somewhere right around 20,000 cycles per second/no, two of them/dysharmonic/I never diss harmonic/what's* wrong with dat *harmonic?/God,* I'm *sleepy/hey, why can't I hear my* own *pulse?/I wonder* if—

"There's a certain interior monologue that never stops, isn't there?"

Her voice startled me, enough that I opened my eyes. "Yes. Yes, there is."

"Try and make it stop."

"Stop thinking? Completely? Hell, that's one of my best tricks."

"Go ahead."

About five minutes later, I admitted defeat.

"Whose is the voice you hear?"

"My own."

"To whom does it speak?"

"To . . . to me."

"Why?"

It was a good question. How could it be so important to tell myself things I already knew that I couldn't seem to stop, even for a second? I had always prided myself on controlling my own mind . . . but it now seemed I only had limited control of what it thought *about.* But I could not make it stop.

"I don't know," I admitted. "It must be terribly, terribly important, because I can't make it stop even as long as I can make myself stop breathing. It's like my heartbeat—if it ever pauses, even for a few seconds, I'll die. But that can't be true: I've stopped thinking altogether a lot of times. Drunk . . . stoned . . . sedated . . . anesthetized for surgery . . ." I trailed off, realizing I wasn't sure whether I'd stopped thinking at those times, or just stopped recording the thoughts. "Maybe not. I don't know."

"You don't need to be afraid of it, I promise."

"Are you sure?"

"Your record says you're a musician and composer, but is vague about what kinds of music you're interested in. Do you know the classics? The Beatles?"

"Sure."

"Turn off your mind. Relax, and float downstream. It is not dying. That advice was ancient back then."

I shrugged. "Okay. How?"

"People have been trying to make their minds stop for thousands of years. It's called meditation. There are some useful tricks that have been passed down. Come here and I'll show you some."

She got up and moved to an area with no furniture. I could tell she was a Loonie by the way she handled herself in a third of a gee, but it wasn't so much awkward as unpracticed. She had the necessary strength to handle twice her normal weight, and would get more graceful at it with time, like perfecting an accent. I got up and followed her. She was just placing on the floor two objects like giant black cloth hamburgers. Pillows, it seemed: as I watched, she dropped effortlessly into a cross-legged seat on one of them, seeming to melt slowly like the Wicked Witch of the West despite the double gravity. She gestured at the other. "Sit down, Joel."

I did so far more clumsily, despite being in my native gravity. Pillow? It was just barely a cushion—made of soft cloth, but filled with something unyielding, as soft-but-firm-underneath as a ...

"It's called a zafu," she said. "Don't sit square on ii, but a little forward on it, almost falling off the edge, and put your legs like so." She demonstrated.

I dug in my heels. "Hold on a minute. Is this some kind of religious thing? Buddhism or something?"

She smiled. "Atheist?"

"Agnostic."

"Fear not. Buddhists are only one of many groups of humans who have found this a useful posture for meditation. So have Hindus, Taoists, TM'ers, and a dozen other groups. And in any case, Buddhism isn't a religion, strictly speaking."

"It isn't?"

"No god, or gods, or goddesses—except in a couple of the more obscure sects. No heaven or hell in the theological sense. No patriarch or matriarch, no Prophet or Pope. They don't go in for holy wars, or heresy hunts."

"Really?"

"Buddhists believe the Buddha himself was simply a man, who woke up one day. As far as I understand it, anyway. I know hardly anything at all about Buddhism. If you're interested, you can talk to Tenzin Itokawa, the Relativist. He is a Zen priest, of the Rinzai school. Right now, forget Buddhism. Forget religion. Just put your legs like this and trust me, okay?"

I tried. "Show me again."

She unpretzeled, and then pretzeled again slowly. I tried to copy it. This time I came closer.

"Other way round. This one over that one. There—that's it. Now work your knees around a little until they're comfortable."

Suddenly I seemed to just snap into place. "Like that?"

"That's it. Good. Okay, now Spine straight. Stack those vertebrae. Hands together, palms up, left hand on top, with the thumb tips touching. Settle your skull on those stacked vertebrae. You've got it."

It did indeed feel like a position I could hold for a while in relative comfort. "Now what?"

"Don't just do something: sit there."

I mentally shrugged and did so. Or rather tried to stop doing anything. As before I tried to stop thinking, too—with no better success. But I did become aware that I was starting to relax. My thoughts didn't exactly slow down . . . but they became less intense, somehow.

After a few minutes of silence, she said, "Now we do a breathing exercise so childishly simple it can't possibly have any effect."

"Sounds good."

"There really is nothing to it. In your head, count to four, at intervals of about four seconds, or a little longer." I did as she asked. "Okay. Now, you inhale for a count of four . . . then hold your breath for a count of four . . . then exhale for four . . . then hold for four. In, hold, out, hold. Repeat, and keep repeating. Try it."

I played along. A full cycle, then another, then another. After half a dozen or so, I found the rhythm, and settled into it. Easy as pie. Considerably easier than pi. Stop that, Joel.

"Good. Now with each cycle, slow it down just a skosh. Not much, and when it seems to be too much, let it come back up again, until you find your slowest natural speed. As soon as you're sure you've found it, stop counting and just breathe."

It wasn't hard. It was mindless, was what it was. Silly, and pointless, and . . .

. . . and I could feel my shoulders settling. Feel my facial muscles relaxing. Feel my pulse slowing, and deepening, and steadying. *Hear* my pulse, playing bass under the alternating E-A E-A organ chords of my breath. As I became aware of it, I had the idea I could hear it slowly changing from electric bass guitar to acoustic standup bass, quieter but more resonant.

I let myself sink into it. I closed my eyes, and paradoxically as I did I became more aware of the room, of my position in it, of its position in the *Sheffield*—and as I followed the thought to its logical next stopping place, it was as if the ground fell away beneath me without warning. Have you ever been so stoned or drunk that you suddenly fancied you could actually *perceive* the vast slow spinning of whatever planet you live on? Not just as something known intellectually but as something felt in the gut? Ever find yourself clutching the ground, to keep from falling off? Well, something like that happened to me then. For the very first time, I suddenly *got* where I was.

I was in an incredibly, pathetically flimsy bubble of moist air, hurtling through interstellar space at a speed so intrinsically terrifying that its friction with *nothingness* was enough to require powerful and clever shielding, propelled by a force no man really understood, so powerful it could have wrecked my star if invoked too near it. With a would-be village of other misfits and refugees I was plummeting through the universe so fast Time itself couldn't keep up—living by Dr. Einstein", Clock, while behind me the rest of the human race continued to age as God or random chance had intended. In these hairraising conditions I would, if I was very lucky, spend approximately the next fifth of my life racing toward a destination I had not given a second's serious consideration, a place where, if I was incredibly lucky, it would prove possible to raise turnips and keep hogs, and the monsters wouldn't be able to kill me.

All this in a microsecond—then in the time it took me to open my eyes the feeling popped like a bubble and I was back in my body again, was just a guy sitting in a room doing nothing at all. It happened and then was over so impossibly fast that I was still relaxed: there hadn't even been time for my heartbeat or breathing to increase. But when I did get my eyes open the first thing they saw was Dr. Amy's eyes looking straight into them, and I knew at once that she knew what had happened to me. She'd been expecting it to happen. No, that was wrong. She had known it might happen, and had hoped it would. My whole head vibrated for a few seconds, like a hummingbird in denial. "Whoa!" I croaked.

"See, Joel? You sat still and quieted down . . . and you noticed where you are. Sit still longer and you'll start to notice where you're going. Sit still long enough and you may figure out why you're going there. You could end up with some clues to just who the hell is doing all that."

"And that would be a good thing?"

"Yes," she said, raising her voice two notches higher in volume for the single word. "Stop looking dubious. When you peel back enough layers of your own bullshit to finally get a good glimpse of yourself, you are going to find you respect yourself a good deal more than you expected to."

I said nothing.

"I promise that, Joel. The journey you need to take isn't going to be easy . . . but you're going to like the destination. Certainly a lot better than where you are now. Now lie to me."

"Beg pardon?"

"Tell me you believe me."

I tried unsuccessfully to suppress my grin. "I believe you believe it."

She nodded. "Close enough. That's enough for one session. Here's your homework. First, I want you to spend an hour a day sitting zazenthat's what you just did—and I'd like you to do it in a Sim Room."

"I was thinking of a spot on the Upper Ag Deck."

"Later. Starting out, use the Sim. Accept the simulations it offers you for the first two weeks, the ones I'll program for you. After that you can override if you want, using your judgment. After three or four weeks we'll slowly bring you back out into the real world again. The Ag Deck might be a great place to start."

I thought up some objections, and decided to hell with them. If she wasn't smarter than I was, this was all a terrible mistake. "Okay. That was `first.' What's next?"

"I want you to get in shape. You're healthy enough, but you're quite out of condition for your age. Do what the Gym tells you."

It was easier to think up objections this time, and they were better objections. The one I wanted to admit to was, "Where do I find the hours?"

"Shave them from either your farmwork or your music. Whichever is less important to you personally."

It is annoyingly hard to object to a reasonable proposal. She was right. I was out of shape. "Okay. Meditate, work out. What else?"

"Study your destination. Learn everything you can about it. The star, first—where Immega 714 lies in the sky, why it took so long to discover, how it's different from Sol. Then the planet: What kind of world is Brasil Novo, how is it like and unlike Ganymede, what's living there already, what kind of place is it going to be for a kid to grow up in?"

To that I had no objections. "Done. Meditate, exercise, look out the windshield—anything else?"

She nodded. "Yes. I want you to start dating. Joel? *Joel!"*

"You go too damned far," I said on my way to the door. It would not iris open fast enough to suit me, so I tried to hurry it with my hands and it jammed in its tracks, not quite all the way open. I had to stop in my own tracks, my exit spoiled by an absurd social dilemma. I could not walk away and leave her with a broken door like some kind of barbarian, but I had no idea how to repair it. I stood there, unwilling to turn around until I had some idea how to cope with the situation. I'm pretty sure in another second or two I'd have remembered that I was a rich man, now. But before I could think of it, behind me she said drily, "My door is always opeh."

It is very hard to remain annoyed at someone who has just made you burst out laughing. I gave up and turned around and she was laughing, too. She had a great whoop of a laugh. We got into one of those things where each time you're just about to get it under control, the other cracks up again. It always ends eventually with you smiling at each other, breathing like runners after the marathon.

"Okay," she said finally. "If you can laugh like that, you can take a few weeks before you start dating again. Go do your homework." I nodded and gestured at the door. "I've got this."

She nodded and put her attention back down on her screen, as she d been doing when I'd first seen her.

I guess that was really the day I finally joined the colony, became a Brasiliano Novo—or at least, decided to try. I had already been utterly committed, physically, since the *Sheffield* had left orbit, but it was only after I left Dr. Amy Louis's office that afternoon that I finally started to become *emotionally* committed to anything but numbness. Until then, I had been not only drifting, but paying no attention where I was drifting. Reefs or deeps, rough seas or doldrums, all had been the same to me. But from then on, I was at least back on the Bridge, trying to work out my position and best course, trying the rudder, learning how the sails handled, testing the diesels, scanning the horizon for clues to the weather ahead.

I don't mean to suggest it happened in an hour. It took weeks to happen, months, years. But that's the hour when it began happening.

Twelve

There is no easy way from the earth to the stars.
—Seneca

The first thing I did about it was not move out.

Everyone seemed to assume that now that I was stinking rich, I would of course move out of the prematurely decaying hovel I had been sharing with three hapless losers, leave Dear Old Rup-Tooey behind me in the dust, and settle into vastly more lavish solo quarters several decks higher, and with all the privacy, comfort, and (most prestigious of all) roominess that could be desired by a healthy young nouveau millionaire whose Healer had advised him to start dating.

But I had lived alone before. I had *always* lived alone before. Until I'd been accepted into the Tenth Circle, I'd had no idea how much that sucked. I remembered it well. I had no particular reason to suppose money would make it all that much better.

Also, I kept remembering that I might very well have been spaced as a danger to the *Sheffield* by now, if it had not been for my bunkies Pat and Herb. And for Solomon Short, who was One of the six wealthiest people aboard, and had chosen to be my friend when all I had to my name was a good sax.

Besides, as Mark Twain says, two moves equals one fire. I'd already moved once recently.

So I stayed where I was. But I reached out to another friend, as wealthy as Sol and considerably more practical, and sought his counsel. And George R smiled, and pointed me toward the best mechanics, engineers, artisans, electricians, cyberpeople, and plumbers aboard, and snipped some bureaucratic red tape to get me permission to clear out storage cubics immediately next door on either side and cut through some walls. When all the busy beavers had gone away again and the dust had settled, RUP-0010-E was the most solid, reliable, comfortable, luxuriously appointed, and technologically advanced living space on that deck—and its 'fresher was probably the best in the *Sheffield,* so unreasonably large that all four of us could have used it at once, with a guest apiece. And so advanced in terms of hedonic technology that we all suddenly found ourselves very popular fellows in shipboard society: people wanted to be invited over for long enough to need to use the 'fresher. It didn't work well because we were usually in there ourselves.

Pat got all the data-chasing and pattern-spotting software his heart desired, and enough processing power to provide practical, realtime access to any historical datum on board. Or behind us in the Solar System, although that was already becoming more and more out-of-date as Einstein effect started to mount up. But historians aren't in a hurry.

Herb received the power to seal off his quadrant of the room at will with two mirror walls that would not pass light or sound in either direction, within which he could not-write in privacy.

So did Balvovatz, but I doubt he got much writing done, because he never activated his field if he was alone in there, and never stopped smiling when he came out. He told me years later, weeping drunk, that it was the first place he had ever lived that a woman who did not love him desperately would come to. I laughed so hard he stopped weeping and began laughing just about the time I quit laughing and started to cry.

For myself, I settled for two major infrastructure improvements. First, a robot that made French Press style coffee from fresh-ground recently roasted beans on demand and adulterated it to my taste; it claimed to be fully automatic, but actually you had to push a little button. And second, a bunk that was as comfortable as any in the *Sheffield* . . . and on top of which I, my roommates, *and* Richie and Jules could all have piled at once and done jumping jacks without making it creak, much less rip free of the bulkhead. Nothing in that room was breakable by the time I was done with it.

So much for change in my *physical* environment.

On my way to the Sim Room for my first session, I wondered what sort of exotic locale Dr. Amy had programmed for me to meditate in. The *Sheffield's* Sim gear was less perfectly convincing than what I'd experienced at the Conrad enclave back in British Columbia . . . but not by much. It was one of the few areas Kang/da Costa had splurged on. I guess I expected something grandiose and imposing and sacred—the Eiheiji monastery in Japan, or Jaipur Lake Palace in India, or Vatican City before the Prophet's Angels got ahold of it. Or possibly some secular but stunning scenic vista: Vancouver Harbor, or Rio de Janeiro in old Brasil, or looking east from Olympus Mons on Mars, or Titan seen from the Rings, or my own favorite, Jupiter from Ganymede, at night, through an aurora. Nor would I have been surprised by a simple flood of sheer kaleidoscopic imagery, like a screensaver display, or the fireworks you can sometimes see behind your closed eyelids.

I got a blank white wall. About half a meter from my nose.

I've since learned that several schools of Buddhism do that, too: meditate facing a blank wall. It makes a certain amount of sense. Minimal visual distraction, maximal visual canvas for any visualization imagery you may find useful—and a constant, ongoing, gentle reminder that you are doing something not-ordinary, that you are now removed from the conventional world where sensible people do not sit staring at blank walls.

An equal number of Buddhists find this appalling, and instead sit with the blank wall *behind* them, facing another one across the room ... and any co-practitioners in the way. What distinguishes Buddhism from any other faith I've studied—from most human beings, really—is that the people who face the wall and the people who face away from it have never fought a war over it. They're never going to agree . . . but they feel no need to. Buddha himself is supposed to have said, "People with opinions just go around bothering each other."

I thought both sides were crazy myself, when I first started, and Dr. Amy too for assigning me that program. My second day I mutinied, and reset the Sim for a Ganymede vista, as close as it could come to my own pasture at night. But at the end of the hour, I realized I had wasted the whole thing thinking. And worse, feeling, which was even less helpful. Nostalgia hurt too much. I tried it her way the rest of the week.

I spent nearly every minute of that first week more than half convinced I was wasting my time, waiting for something to happen and then uncertain whether or not anything had. But at the end of the week, I found that I was looking forward to it. Imagine that you've been carrying twenty kilos of sand in a backpack without knowing it, all the days of your life. Then one day somebody shows you how to take it off for a moment. It was that much of a relief, I learned, to be able to set down now and then, for whole minutes at a time, the ongoing burden of thought, to briefly silence the constant chatter of my mind compulsively reassuring itself that I was still alive. For periods measurable in whole long seconds, I could sometimes become transparent to my own feelings and emotions. Occasionally there would be what I can only call moments of clarity, when I seemed able to see without distortion and accept without fear. After a week of staring at that silly blank white wall, I was sorry when the time came to change it.

Until I saw the new Sim.

It was a series of paintings, or rather two series, acrylic on canvas, by a PreCollapse artist named Alex Grey, who lived and worked on Terra, in New York, in the twentieth and twenty-first centuries. You sat zazen for a while, and then you started up the image slideshow and looked at the paintings, and at programmable intervals they changed. That doesn't sound very dramatic—but I'm talking about the kind of art that ought to be served with a whisk broom, so the customer can brush the sawdust off his shirt when he gets back up. Grey made timeless art that probably would have spoken to a Neanderthal. Indeed, many parts of his vision were at least that old.

All the twenty-one paintings in Grey's Sacred Mirrors series are at least man-tall. First in the sequence is a pale gray human silhouette, facing you, arms slightly apart from its sides, palms outspread, almost as if to say, "Here I am."

Second painting: the background goes to black, and the silhouette is filled by an extremely realistic skeleton, man-tall and detailed. Third painting: the same skeleton is overlaid by an incredibly detailed and accurate rendering of all the nerves in the human body; the complete electrical wiring system for the skeleton, brain at the top, and nothing else.

The golden nerves seem to leap off the canvas, rendered with the same sort of gilt that medieval manuscripts used to he illuminated with. Fourth painting: the nerves vanish, replaced by the circulatory system, rendered in blue, heart in the center of the breast—and for the first time the body is recognizably male, with testicles. The fifth painting details the complete lymphatic system—but this body is female. Successive paintings detail male viscera, then a female musculatory system complete with fetus in a cutaway womb. And finally the body grows flesh, becomes a naked Caucasian woman, facing you calmly. The next painting morphs her into a naked Caucasian man; the next an African woman; then an African man; then an Asian woman, and finally an Asian man.

Each of these figures, from the skeleton on up, has been depicted with such exquisite realism that the next painting has more impact than it might have alone. It shows the psychic energy system. The flesh has melted away, leaving bones and organs and nerves and veins and staring eyeballs . . . but all are shot through now with gleaming shimmering crackling filaments of energy, and the six chakras of so many mythologies are visible at brain, throat, heart, navel, abdomen, and groin, glowing with power like white coals, and the entire body is enveloped by a translucent pale blue aura made up of infinitely tiny threads of energy, and it is quite clear that all of it—body, chakras, and aura—are physically connected to the rest of the universe, exchanging energy with it. The next painting takes that even further: the flesh and meat and bone melt away, leaving a human-shaped form composed almost totally of the strings and threads of energy that generate it, extending outward to meet the cosmos at head and feet, wrapped in a great bubble of unimaginable power. And in the next painting, even the vague body shape is gone, leaving only a boiling torrent of loops and circles and lattices of universal fire that Sol later told me was remarkably like the mental picture he had going through his head when he was doing his job.

There were more paintings in the series, but most were topheavy with denominational religious iconography, so I usually chose to fast-forward through them. Such imagery was perfectly fine back in those days, indeed laudable . . . but now of course feels faintly indecent, a reference to a bloody period in history we would all prefer to erase, if it were not that the horrid lessons learned in it must never ever be forgotten. Those images have all joined the swastika: symbols of spirituality perverted, than which there is no greater evil.

After that came a different series of thirty paintings, which Grey called "Progress of the Soul." Each depicted one or more of his strange, skinless, fleshless glowing people, connected by powerful invisible energies to the world around them, carrying out a variety of utterly basic human activities. A man with bowed head, praying, a halo of golden energy pouring from his head. A man and woman side by side, staring rapt at the heavens together, information flowing in *both* directions. A man and woman kissing in close embrace—surely the most intimate embrace ever rendered, since you can pick out every sinew, nerve, or capillary in their bodies, *see* the normally invisible pulsing energy they create being passed back and forth, heterodyning, lighting the world. The same couple, copulating—an almost nuclear explosion of energy indescribable in words. Then the same couple standing, he reaching around from behind her to touch the hugely swollen belly inside which their child can be seen; that particular painting is framed on either side by an ontogeny sequence of ten images, one for each month, starting with sperm meeting egg, and ending with a full-term fetus. Then one I found it easy to stare at forever, called "Promise," in which the expecting lovers face one another, and promise each other what they will do for this child they're making together. On the ground between them is a two-year-old . . . holding a skull.

There are quite a lot more in the series, but I'm going to stop describing them now, because the next one in sequence, "Birth," is simply so powerful that I've never been able to endure looking at it for more than a few seconds; then my eyeballs start to cook and I have to look away.

But near the end of the series is one often considered Grey's masterpiece, called "Theologue." It depicts a man doing exactly what I was doing the first time I saw it: sitting zazen, legs folded beneath, hands placed on his lap in the mudra position, head slightly bowed, meditating. A translucent golden round halo surrounds his head, and a transparent Dlue egg-shaped halo surrounds his whole body. He is seated at least a foot off the ground, on a kind of net made of interwoven strands of energy running in three directions, bright white and so intense flames lick up from them in the vicinity of the seated man, but do not come close enough to burn him. Behind him, through the grid, gray mountains can be seen to recede forever. All six of his chakras shine with universal fire.

It is clear that he is engaged in theologue: in a dialogue with God. Who is himself.

Maybe I've conveyed nothing at all to you. If so, just take it from me that a few weeks' exposure to those paintings helped me heal—physically, mentally, psychically, spiritually. Grey himself said one of the specific purposes of his work was to make people healthier. He had seen a study which showed that people who had just seen a frightening, disturbing 2D movie called The Exorcist left the theater with their immune systems weakened, more vulnerable to disease. He decided if art could do that, it could damn well do the opposite, too, and should—so he devoted his life to learning how to create images that left the viewer healthier. I could not begin to describe how he does it, even if I understood it. Just take it from me that if you are ever mindblown or heartsick, what you want to do is look up the works of Alex Grey, in the best reproduction you can find, and let them work on you.

Then for two weeks, I reset the Sim to place me on an imaginary satellite orbiting low over Brasil Novo's equator, at a speed that kept the primary, Peekaboo, always behind me. I forgave the simulated satellite for impossibly having local gravity, since sitting zazen in orbit would have been impossible without it. And finally, I moved out of the Sim Room altogether, and set up my personal traveling zendo in the second of the two good spots I had mentally marked on the Upper Ag Deck.

As Dr. Amy had decreed, in addition to sitting, every day also had sweating.

For the first several weeks I chose swimming as my primary exercise, because it develops every one of the useful muscles and none of the others. That meant long trips to the upper decks, just below the Bridge Deck. The *Sheffield* kept its swimming water as far forward as possible, to act as some additional protection against the constant shower of deadliness from dead ahead—the bitter complaints of the very tiny, very nearly nonexistent bits of the universe we were enraging to white heat by hitting them at a large fraction of *c*. (Our drinking water was stored at the opposite end Of the ship, against the day when we would flip over and begin decelerating for the last half of the voyage.)

The Pool area turned out to be a lively, buzzing social center, one of the primary places where the people aboard *Sheffield,* colonists, crew and transportees alike—went to meet each other for sociosexual reasons—practical when you think about it, since everyone there would be naked sooner or later. While I still was not ready to follow Dr. Amy's advice, I did notice that I worked harder at my swimming than I would have exercised if I had been alone.

While swimming there I got talking with Tiger Kotani, the kindly man I'd met briefly in the antechamber before my examination by Magistrate Will. He turned out to be a soft-voiced dignified astrophysicist from Terra. He persuaded me that simple fitness was not enough, and talked me into signing up for a self-defense class he taught.

Nowadays, of course, most citizens reliably expect to live out their lives without ever being involved in a violent altercation. People looked at me a little funny because I had been. I agreed that it had been a shameful event I should have been prudent enough to avoid. But I also found myself thinking that I was on my way to a frontier world, where people often acted in primitive ways, and where native fauna often acted in murderous and unpredictable ones. If, Heaven forbid, violence should ever come my way again, it seemed to me that it might be very nice to *win* the fight this time.

By the time Tiger-Shihan was through with me, I had reason to be confident that I might at least survive. He did not teach me to be a killing machine. But he did teach me to be pretty damn unkillable, and to sharply discourage attempts. I believe he himself could have massacred the entire ship's complement, proctors and all . . . if we'd attacked him first. All his technique was defensive.

He was also kind enough to teach me a few utterly nonviolent evasive techniques, which became necessary when I learned that some girls who take self-defense classes are the kind of girls who find a man who has been in a violent confrontation with other men interesting. Thanks to Tiger's footwork advice, I was able to keep them all at arm's length ... but sometimes I worked harder in the corridor outside the locker rooms than I did in the dojo.

The one female I was always happy to see was little Evelyn, so many trillions of kilometers behind me, whenever one of her rare brief letters came in. She always found some way to make me smile. I tried my best to return the favor.

One day another student of Tiger's named Matty Jaymes, a pleasant-faced man in his forties who showed a lot of quick in class, happened to come past as I was explaining to a persistent brunette that I couldn't join her for coffee because I had to study: my Healer had told me to learn everything I could about our destination. This was the truth; I simply omitted to mention that I had already been ducking the task for over a month, and fully intended to keep ducking it that night. Matty stopped short, managed to accept the date I had just evaded without awkwardness for any of us, then placed a tractor beam on me somehow and took me in tow. He wanted to discuss music history, about which it soon developed he knew about as much as I did myself.

But he was no musician. By the time we got back to his quarters I knew he was an astronomer, like Tiger, and when I saw that he shared the space with no one, I twigged that he must be *the* ship's astronomer. The same one who had originally tried to interest me in his intensive study of Sol, back when I'd made my abortive stab at a job hunt.

If I'd met Matty—he flatly forbade me to call him Dr. Jayrnes—in person back then, instead of by e-mail, he would definitely have met my definition of interesting. I haven't met a lot of men with genius-level minds whom women found irresistible—but at least a dozen of them called warm greetings to him during the few minutes we were in transit.

He certainly saved me a lot of time, once I got him off music history and onto his own field. Except for Claire Immega herself, there may not have been a better expert on Peekaboo and Brasil Novo anywhere in the Galaxy—because it had been to Matty that the report of Immega's successor Anabel had been addressed, a fact he mentioned as if it were of no significance. If you don't count the telepathic communicator who passed on the message, and probably had no idea of its importance, Matty had been literally the first person in the Solar System to know that Immega had discovered gamma Bootes was *not,* as thought, an A7 III star—a giant—but a binary star, whose companion was a G2 very like Sol. Her robot probes had found a very promising planet orbiting the new G2 star—news that had rocked four different planetary stock exchanges when it became public, and had ended up causing the construction and commissioning of the RSS *Sheffield.*

It didn't seem to impress him much. Matty spent the entire trip to his room explaining to me the problem with his Sol study, and I think he believed I understood what he was saying, even though I did *not* try to fake it. He simply was so focused and so excited, he failed to notice my incomprehension, which would have been incomprehensible to him. All I gleaned was that his research was really frustrating to him, because for some reason he absolutely hated the data he was getting.

He had happened to catch a perfect solar eclipse by Terra as we were leaving the Solar System, a major stroke of luck—I understood that much. And something about the displacement of a few stars *behind* the sun was very very slightly wrong, and somehow that was very very bad. It indicated something about the "J2 component of angular momentum" was bollixed.

But when I tried to find out just what that meant, and why it bothered him so badly, he changed the subject back to the star he was supposed to be telling me about: the one at the *other* end of our trajectory. Immega 714, AKA Peekaboo.

"In all the catalogs, gamma Bootes or HR5435 is commonly listed simply as 'gamma Boo,'" he explained cheerily "So when Claire Immega of the 44 Bootes colony sent back word that gamma Boo was not a single star but a binary, with a G2 companion, the formal name of the G2 became Immega 714 in her honor—but it took about fifteen seconds for the System's media to name it Peekaboo. And when she added that its second planet looked *extremely* promising in terms of habitability, naturally that became Peekaboo Two. The name was just annoying enough to stick in a lot of minds, and the da Costa consortium became interested right away."

But of course, you don't start outfitting a starship on the basis of promises, however extreme. It wasn't until Immega's robot probes confirmed the good news that da Costa formed its partnership with Kang and began seriously planning our expedition. That took a while. Long enough that Immega herself did not live to learn just how spectacular her find had been.

Picture the geometry 44 Boo, a variable star (eclipsing binary), lies a little more than forty-one lightyears from Sol System. From there it's another forty-three and change to the newly discovered Immega 714. The first colonists to settle on 44 Boo's fourth satellite were a bit too busy surviving to stargaze a whole lot, but eventually two of them combined to produce Claire Immega. She became an astronomer, and soon discovered Peekaboo and Peekaboo Two. She was twenty-five before she had amassed sufficient clout to browbeat her fellow colonists into letting her divert what must have been scarce resources for ultrahighspeed probes. Even though these very tiny but very intelligent robots managed a very high fraction of c on their journey, it naturally had to take them *well* over forty-three years to make the trip, and then another forty-three years for their reports to make it back to 44 Boo at lightspeed.

From there, of course, the colonists' telepaths were able to pass the data back to their siblings back at Sol System in zero time. But Claire Immega was over thirty years dead by then. So she never knew, at least not for sure, that the new planet she had given mankind was one of the best it had yet found within its reach.

"G type stars like gamma Boo are damned scarce within eighty lightyears or so of Sol," Matty told me, "and G2s that happen to have planets of the right mass orbiting within the zone that will permit liquid water to exist are less common than buttons on a snake. By now nearly all the really promising ones already have colonies either in place, or on the way there. And so far, nobody else has drawn the kind of jackpot Immega did."

"It's really that good?"

"Well, if you had your heart set on skiing, or ice fishing, I'm afraid you're screwed. If you like bonebreaker gravity, you'll hate the place. If you adore hostile environments, harsh conditions, scarcity, and surly natives, you'll be bored silly. But if you can steel yourself to a world where your feet never hurt, food and energy are cheap, and everybody goes naked most of the time . . ."

Thirteen

That is happiness: to be dissolved into something complete, and great.

—Willa Cather

As soon as we got back to his luxury digs, he started bringing up Brasil Novo stats for me. Normally I'd rather read figures in printout than onscreen . . . but what he used for a monitor was an entire wall, bigger than any two walls in my place. So I sank back into an armchair so comfortable I kept murmuring thanks to it, sipped Matty's excellent Scotch, and learned.

Brasil Novo is roughly the same size as Mars, but thanks to a smaller iron core, it is twelve percent less dense, giving it a surface gravity of .33 gee rather than Mars's .38 gee. It lies more than 1.1 AU from its star—but Immega 714 is slightly brighter than Sol, so it seems normally bright in the sky for a sun, despite being ten percent farther away.

Here is how the planet stacks up beside Terra:

	Brasil N	**Terra**	**BN/Terra**
Mass (10^{24}kg)	0.5648	5.9746	0.095
Volume (10^{10}km3)	16.318	108.321	0.151
Volumetric Radius (km)	3390	6371	0.532
Mean Density (kg/m^3)	3461	5515	0.628
Surface Gravity (m/s^2)	3.26	9.8	0.333
Escape Velocity (km/s)	4.43	11.19	0.396
Distance from Primary (AU)	1.1	1	1.1

And here, for perspective, is a set of similar comparisons between Terra and another reasonably well-known planet of comparable gravity:

Mars Terra Mars/Terra

Mass (10^{24} kg)	0.64185	5.9736	0.107
Volume (10^{10} km3)	16.318	108.321	0.151
Volumetric Radius (km)	3390	6371	0.532
Mean Density (kg/m^3)	3933	5515	0.713
Surface Gravity (m/s^2)	3.71	9.8	0.379
Escape Velocity (km/s)	5.03	11.19	0.450
Distance from Primary	1.38-1.66	1	1.52

Brasil Novo comes complete with two moons, quite similar to those of Mars. For that reason, and for emotional/political reasons less susceptible to analysis, it had been rather illogically decided to name them, too, Phobos and Deimos.

"What difference does it make?" Matty asked when I raised the issue. "Nobody's likely to confuse them in conversation with the ones we left eighty-five lightyears behind. And very soon after arrival, everyone is going to become sharply aware that those two moons will have radically different *effects* than their namesakes, at least."

Always happy to play straightman to a speaker who truly enjoys his subject. "Why's that?"

"Because of something Mars lacks that Bravo has in great plenty."

It took me a second to recognize "Bravo" as an Anglicized contraction of Brasil Novo. It was the first time I'd heard the shorthand, but it would by no means be the last. Within a year, even the two dozen or so real Brazilianos aboard would be using it. "What's that?" I repeated.

He blinked at me. "Water. Teratons of water. The original Phobos and Deimos have tidal effects, but there's not enough surface water on Mars to make them visible. Bravo is going to have *very* complicated tide, and I suspect its version of a king tide will be an *emperor* tide."

I thought about it. "So, moist air, then."

"It better be."

The only reason it didn't get tedious saying "Why is that?" to this man was that he always answered, and the answer was usually interesting. So I said it again.

"We expect, or at least hope, to live there. So we'll probably want to breathe a lot. You have probably noticed that we are not carrying along with us in this bucket five hundred and fifty Mars-type low-pressure masks, plus several thousands more for replacements and the next several generations of offspring, nor are we spending any time drilling in them or trying to become acclimatized to them. If not, you've surely noticed that you don't wear one when you're working on the Upper Ag Deck."

He paused, and did not say, "Think it through."

Let's see. Atmosphere breathable without assistance. But even less gravity than Mars or home. So to get Terra-standard pressure, there are only two possibilities: the atmosphere must be thicker, or it must be much higher in oxygen.

Okay, take Terra. Its surface gets that much pressure from lying under a troposphere about twelve kilometers high. Brasil Novo's lower atmosphere would need to stand an unreasonable thirty-six klicks tall to yield that much pressure. So ...

"The place is a tinderbox!" I exclaimed.

He shrugged carelessly "The drier parts of it, yes. The air is a little over thirty percent oxygen. Here, take a look at this." He gestured shamanically with his hand, working some virtual remote control only he could see, and the wall display changed to:

ATMOSPHERIC COMPOSITION

Gas	**Bravo**	**Terra**
Oxygen	30%	21%
Nitrogen	60%	78%
Water	4-8%	0-4%
CO_2	0.10%	0.04%
Other	1%	1%

"Clearly it's going to be a warm, moist planet, by human standards. A jungle world, very much like the Amazon Basin of Old Brasil back on Terra, I imagine. Its fauna seem to be fantastically better at photosynthesis than ours. But your guess is correct: that thirty percent oxygen is going to make for severe fire danger. I suspect that if an expedition to one of the drier regions were to be struck by lightning, the lucky ones would be those killed outright on the spot. I doubt the rest could outrun the flames."

There are times when I'm happier to have a vivid imagination than I am other times.

"But there will be no shortage of damp places. Bravo has almost as much salt water cover as Terra—a bit more than half its total surface, compared to Terra's seventy percent. What you get basically is three major continents, more or less evenly spaced around the globe, each supporting a large dense jungle, with a major river flowing out of each, as in the Terran Amazon or Congo. There are also several large continental islands analogous to Australia, and if you'll pardon the technical terminology, umpty gazillion smaller islands, ranging in size from humungous to teeny-weeny"

"Okay, got it. The farther from the seashore, the more fire danger ... but there's a *lot* of seashore."

He nodded. "The planet's axial tilt is only fifteen degrees, as compared to Terra's twentythree point four five degrees. So there will be distinct seasons . . . but less pronounced than on Earth. No freezing winters. No polar ice caps."

That was good. I hate wearing stanfields—as long underwear is called in Canada, for reasons probably lost to history and certainly unknown to me. A world without snowdrifts was just fine with Joel. And no polar ice meant more of the total surface available to live on; more places to put usable seashore.

"And the day/night cycle—"

That one I could address. "—is nearly identical to Mars. Twenty-four hours, thirty-something minutes. Uh, thirty-seven."

"Of course, that must be what the Zog has you using on the Upper Deck. Well, the farming is probably going to be even better on Bravo than it is in Zogland."

"Really?"

He caused images to slideshow on his wall, some still, some moving—and all striking. "As you can see, the place is tectonically quite active. Volcanic mountain ranges. Good thing; it keeps the atmosphere replenished. So volcanic ash fertilizes the land—and the mountains present sent useful minerals and metals which we reach by blasting a little bit sideways instead of digging way down and hauling it back up. But from a peasant's point of view, the best part is going to be the weather: probably the most stable climate humans have yet encountered."

Well, I hadn't said it in several minutes now "Why is that, Matty?"

"Consider the geography" He smiled. "Or bravography, if you will."

"I won't, but you go ahead."

"Thank you. Look at those three major continents. All more or less equatorial. Roughly evenly spaced. Each of them will have a bravographically anchored transportation zone, where jungle trees pump a regular fountain of water into the atmosphere. Ergo, climate patterns will be anchored, too, with weather infinitely more stable and reliable than anyplace in the Solar System."

I understood what he meant when I saw the planet in 3-D projection. Terra is continually plagued by nerve-racking El Nino events because the committee that designed it (it had to be a committee) inexplicably omitted to place a large jungle in the middle of the Pacific Ocean, to anchor that evaporation zone. Bravo lacked this defect. "And that stable weather forecast will be . . . gray skies, lots of clouds? Rain in the morning giving way to rain in the afternoon, followed by a high probability of rain all night?"

"In general, yes, around the equator. With more temperate zones to north and south. But the three big continents themselves will be fairly temperate, and covered with boreal forest."

"A lot of our oldest myths will still work."

He nodded happily "And some others will become for us historical curiosities, requiring footnotes. On Terra, there tend to be large deserts to the north and south of all the jungle areas, including the Sahara, Kalahari, Gobi, Patagonian, and Sonoran deserts. But Bravo does not seem to have real deserts, probably thanks to its more favorable climate distribution."

"Okay by me," I said. "I never met a desert I liked much."

"Oh, I have!" he said emphatically "I'll miss them. Splendid places to do astronomy. But by surrendering them, I'll get to see something unique in their place. I've *seen* a desert. I've lived in a few. But so far, as far as I know, *nobody* has yet seen a Hungry Ghost with his own personal eyeballs, much less spent time in one." He sounded gleeful at the prospect.

"A Hungry Ghost?"

"A firestorm the size of a state or province."

The name sort of explained itself to an extent. One-third gee, and a teeming stable biosphere—the land would be lush with life. The trees must grow to fantastic heights, and sprawl across the sky in the competition for sunlight. But the air they spread through was nearly a third oxygen, fifty percent more than a sensible planet needed . . . which they themselves were replenishing! Let things get dried out in the stable weather, let the ground cover vegetation and tree droppings crisp up nicely into tinder and kindling, let one of the inevitable sparks occur in a very bad place ...

"Tesla's eyebrows, Matty! It must be all the circles of Hell."

"Worse, I think." The bastard was still gleeful. "I'm not saying those were fun, but they all *stayed* put. Once you reported to your Circle and took your assigned spot in the lake of burning pitch, you pretty much knew your address and postal code for the next quadrillion eternities. But Bravo has more sunlight and higher temperatures than Earth, so —"

"—so it's going to have *serious* winds."

"Sometimes. And sometimes hurricanes. Primarily in tropical ocean regions. But also in high elevation land plateaus . . . where forests tend to dry out."

"Oh, that's not good!" Now I fully understood the aptness of the name he'd picked. I had all too vivid a mental picture of a firestorm, the size of Central British Columbia, say . . . that lurched and lunged randomly across the landscape at hurricane speeds, gulping biomass like a drunken sailor on a spree, spewing flames to altitudes previously reached in human experience only by mushroom clouds and weather balloons. Hungry Ghost indeed! Like the Hungry Ghosts I had encountered in my quick surface reading of Tibetan Buddhist mythology: spirits consumed with lust for things that never satisfied, hunger that could not be eased, thirst that nothing could quench. Damned souls condemned to yearn forever, and destroy all they touched, knowing it was pointless. I wondered if a Hungry Ghost typically had an eye, like a hurricane, and how long you'd have to live if you ever found yourself in one. Would it be even theoretically possible to move quickly and correctly enough to *stay* in such an eye, until the Ghost's terrible Hunger burned itself out?

"But that's only going to worry certifiably insane explorer types like me, who go looking for danger," he said with a chuckle. "Farmers who pick their homestead site intelligently, on the other hand, are probably going to be very happy people in Saudade."

Incongruous image of pigs on the Ag Deck. "Sow what?"

"That will be the name chosen for the first town we'll settle. You heard it here first."

"How can you be so sure, this far in advance?"

"Because that's what I strongly feel it should be, and nobody aboard with a contrary opinion is a bigger bully than me."

"It would be impolite to argue with my host. Say the name again, and tell me what it means."

"Saudade. 'Sow,' like a female hog. 'Da,' like the Russian for 'probably not.' `Day,' light come an' me wan' go home."

"You can't possibly know that song."

"Neither can you, son. And if you do, you ought to know the word *`saudade.'* It's a Portuguese word, and the heart of the Portuguese music called *fado.* You could say it is as important a word to fado as 'soul' is to blues, or 'cool' is to jazz. And as difficult to define."

It came back. "I know that word. I've seen it written, anyway, I just had no idea it was pronounced like that. It means . . . well, sort of . . ."

"The best I've heard it rendered into Basic so far," Matty said, "is 'the presence of absence.'"

"The thing you know because it isn't there."

He nodded. "Which, when you think about it, is a pretty fair description of what powers this ship."

"Do you understand the relativistic engine, Matt?"

He smiled. "You flatter me. That's my point: there is some reason to believe there's literally nothing there."

I shrugged. "Big deal. Is nothing sacred?"

He winced politely "I asked George R once, what do you guys actually *do* down there in the Hole? He looked around, leaned close, lowered his voice, and told me the secret. They strap toast onto a cat's back and toss it in the air."

And he waited. I *knew* there had to be a gag, and if I didn't guess what it was, he would win the exchange I had begun by essaying a pun. Well, it served me right. "But how do dat make de ship go, Mr.

Interlocutor," I asked ritually, conceding defeat.

"They butter the toast, you see."

Light belatedly dawned. "Ah. Of course. The toast *must* fall butter side down—"

"—but the *cat must* land on its feet." He spread his hands: QED. "Hence the array spins forever, generating power."

It was a good gag; I grinned in surrender. "It's so simple once someone explains it."

He accepted my sword by saying, "To answer your question seriously, I confess the word that best describes my understanding of relativism is probably saudade."

"The mystery of the ages," I said, thinking to agree.

"No," he said with a sudden seriousness that took me by surprise. "That it is not. Not even the mystery of *this* age."

"Uh . . . I'll bite. What is the mystery of the ages, this one included?" I said, trying for lightness.

He kept frowning, and had stopped meeting my eyes. "Fermi's Paradox."

It took a second. "Oh. 'Where is everybody?' you mean."

He made a single nod. "Nobody even talks about it anymore. We know that life can come to exist in the universe, because it did, once that we know of. We know life can evolve sufficient intelligence to leave its star, because we've done it. It is, granted, conceivable that this might occur only once every twelve billion years or more." He made a face as if he'd bitten into a lemon. "But as for me, I find the creation myth in Genesis considerably more plausible."

"Didn't someone settle this back before the Dark Age?" I asked. "Webb? Wrote a book listing forty-nine possible solutions to Fermi's Paradox—and demolished them one by one, leaving only the fiftieth solution, namely: we're alone?"

He looked as if he'd chased his lemon with milk. "Webb was an idiot. His analysis presumed that if other life did exist, it could not be more intelligent than him. It was the characteristic flaw of the entire PreCollapse millennium: the assumption of vastly more knowledge than they actually possessed." He closed his eyes and rubbed them. "Over and over like a recurring flu they developed the imbecile idea that they understood nearly everything, in all but the finest details. They had no slightest idea what lightning was, how it worked. They had absolutely no clue how moisture got farther than about ten meters up a tree—the highest that capillary action can push it. Fifty years after the splitting of the atom, they accidentally noticed for the first time that hurricanes emit gamma rays. There were quite a few large, significant phenomena they could 'explain,' often elegantly . . . over and over again . . . and had to, because the explanations kept falling apart at the first hard-data-push. Things like the Tunguska Event, gamma ray bursts, why an airplane wing generated lift, what ninety percent of our DNA was doing there . . . yet they were solemnly convinced they basically understood the universe, except for some details out in the tenth decimal place.

"They somehow managed to persuade themselves that computer models constitute *data.* That very complicated guesses become facts. They made themselves believe they had the power to accurately model, not merely something as inconceivably complex as, say, a single zygote . . . but a national economy, a weather system, a planetary ecosphere, a multiplanet society—even a universe. They made solemn pronouncements about conditions a trillionth of a second after the Big Bang, on the basis of computer models, which they had produced with computers not even bright enough to talk, let alone understand speech. They were unlike all the generations before theirs in several ways, but chiefly in that they had no faintest *clue* how ignorant they were. Previous ages had usually had a pretty good handle on that."

"Things got worse in that direction soon."

"Sure. Scientists were claiming godlike knowledge, and couldn't deliver. It got to where even the average citizen could sense they were bluffing. They could go on for literally days on what happened in the first five minutes of creation, without ever saying a single thing that *meant* anything, did anybody any good. They wouldn't even *discuss* what happened when you died, let alone how random chance produced life. No wonder the citizens decided to go back to a different kind of omniscience, that came with omnipotence *and* omnibenevolence thrown in at no extra charge. Twentieth-century science *handed* the world over to Nehemia Scudder, on a plate. No wonder some people preferred 'intelligent design' to evolution. At least it put intelligence somewhere in the mix. Unfortunately, not much."

I was getting a little dizzy "I think I lost you around that last curve, Matty. What's your answer to the mystery? If intelligent life has arisen more than once, in this corner of the cosmos, where *is* everybody?"

He drew in a long slow breath, and held it for long enough to make me think of the breathing routine I still used at the start of meditation. I kept on thinking of it as he exhaled, and his frown melted away and his face smoothed over and his body language relaxed. He fiddled with his remote, and said, "Authorities differ, but for my money, probably the closest thing to intelligent life we'll find on Bravo is the spit-tooth sloth," and the wall showed what I hoped was an enlarged image of the ugliest creature I had ever seen. "Admittedly it is difficult to assess intelligence based on observations made from orbit. Once a probe is fairly sure a given life-form is not a serious threat to man, it moves on to other things that might be. But the sloth's competition is not impressive."

It seemed clear he was changing the subject, and he had been so helpful and generous with his time, that was fine with me; his reasons were none of my business. We moved on to an interesting discussion of exotic fauna like hoop snakes, snippers, blimps, and the truly disgusting rocket slugs, which dodge predators by expelling feces so violently they shoot into the air and glide great distances. A whole pod of such frightened slugs, Matty said, can apparently fill the air with a ghastly green mist. . . .

Later on, though, after I'd read up on spit-tooth sloths, I became less certain he'd been changing the subject. A sloth sits high in one of those preposterously tall trees, waiting with infinite patience until something preyish-looking happens to wander by below. Then she (once the males are done with their fertilizing, their only remaining function is as hibernation food) spits out a poison tooth, with high velocity and great accuracy. It drops the prey for so long she has time to slowly descend, retrieve it, and bring it back up the tree to consume at her leisure.

In other words, they conceal themselves perfectly, take no risks at all, and attack without warning or mercy.

I would recall that later in the voyage.

It all started to come together at some point. The meditation improved my disposition and outlook, without which no beneficial change is possible. The physical exercise began to pay off next. When you're in better shape, you think better. When you're thinking better, meditation produces more useful insights. As I came to understand Bravo better, my work on the Ag Decks became both more effective and more meaningful to me, and before long I started to acquire something I hadn't even realized I'd been lacking: a feeling of worth, of making a contribution, having something tangible to offer. I actually did have a knack for it, too, I learned—for sensing just how the new conditions would alter plant requirements and capabilities, and figuring out ways to compensate. The Zog told me once, after I managed to bring a fungal disease under control without quite knowing how myself, that I thought like a Bravonian vegetable. I don't know if I've ever been more flattered.

In time, it became possible to dimly imagine a future life on Brasil Novo, an endurable and maybe even pleasant one in which I might have both purpose and value.

Two moons in the sky. Similar to Callisto, Europa, and Io back home on Ganymede. I liked that. One moon wasn't enough to keep a sky interesting, in my biased opinion.

There would also be the giant A7 star in the sky, too. Immega 713, as it had been renamed, in preference to some horror like alpha gamma Boo. (Which Solomon of course liked, saying it would make a great name for a fraternity) According to Matty, since it lay one hundred AU away, it had only four percent of the brightness Sol had from Terra—but that made it a hundred thousand times brighter than Luna. It might only get really dark at night when there was heavy overcast, or when the A7 was on the other side of Peekaboo. I liked that, too.

The music I composed became better, stronger, deeper. The music I played finally started to approach what I'd always heard in my mind's ear; I had better wind, a clearer head, and a much clearer idea of who it was playing. Not only did my reputation begin to spread throughout the ship, I began to feel more and more as if it was deserved.

As I said, after a certain point it all began to heterodyne. I felt better, so I did better, which made me feel even better, which . . . So that first year of star travel would probably have been an extremely happy and satisfying one for me, on balance.

If I had not taken *all* of Dr. Amy's advice, and resumed dating six months into it.

I don't suppose it will stun you to learn that Kathy was the first girl I asked for a date. It certainly didn't surprise anybody I knew in the slightest. I'm given to understand that people I'd never met or heard of on the far side of the *Sheffield* knew it was going to happen weeks before it did. God knows Kathy was not surprised to be asked, and had the kindness to accept before I'd quite finished getting the words out, which cut my interval of agonized suspense down to just the hundred million years it took me to not quite get the words out.

And why should any of us have been surprised? We were such a perfect couple on paper that even if we'd disliked each other's body odor, which we didn't, we'd have had to at least give it a try. Musically we shared a bond, a level of communication, that many married couples never do achieve, and others do at the cost of great struggle. Even tone deaf people in the audience could sense it, and responded to it. She was very good, in the same way that I was, and we brought out each other's best. We helped each other say important things we could not express alone, and how far can that be from love?

Loving Zog's Farms was another profound connection, one that went back in time almost as far as music. Plunging hands into soil together is very close to thrusting them into one another. And of course both of us were simultaneously fertile and ripe, a paradox whose metaphorical impossibility accurately reflects the turmoil of that condition. Afterward you look back on it and call it golden. At the time it is hell on rusty wheels.

Part of the problem was precisely that we were so *self-evidently* perfect for each other—a cliche looking for the spot marked X. Enough so to have made us both selfconscious from the very start, enough to make each of us want to dig in our heels out of sheer stubborn unwillingness to be that predictable. We'd both read and seen enough romantic fiction to know that if the writer seems to insist on throwing two characters together, it's their job to resist, for as long as they can, anyway. A silly reason not to love, I know . . . but are there any that aren't?

But in an utterly closed community that small, you can run but you can't hide, not forever. Twenty years stretched before us. Eventually you say, why not get it over with and find out? Or maybe I mean, why not find out and get it over with? One of those. And that too was predictable. Like I said, nobody was too surprised when I asked Kathy out, including her, and nobody was *too* surprised she said yes, even me. I took her to a play, the second production of the Boot and Buskin Society, and afterward we went to the Horn, ordered Irish coffees, and talked.

Five minutes into a discussion of the play we'd just seen—Simon, very well done—I interrupted myself in the middle of explaining why the lead actress's performance had been so remarkable, and launched into a ten-minute monologue of my own. Kathy listened patiently.

I told her about Jinny—first about Jinny Hamilton, and then about Jinnia Conrad of Conrad—and I worked in my father, and the little I knew of my mother, and my experiences with sudden poverty and solitude, and anything else I could think of that might help justify being a basket case. That was probably pretty predictable, too. At a conservative estimate, I was perhaps the hundred billionth asshole since Adam to try and tell a woman, I find your company enjoyable but I am too damaged for any long-term emotional involvement, so don't place your hopes on me. They almost always listen patiently, for some reason. But I doubt if anything I said surprised her very much.

Probably the only person in the entire ship who ended up finding anything at all surprising in that entire date was me, after I finally shut up long enough for Kathy to tell me that she'd gotten engaged two weeks earlier, to two very nice people, and had I ever thought much about opting into a group or line marriage myself? Because they were looking to expand. Full bore omnisexual, of course. But no pressure.

I haven't the slightest idea what response I made. That date lasted another hour and a half—Herb and Balvovatz agreed I got back two hours after the play ended—but I cannot for the life of me recall another word either of us spoke, or anything that occurred.

Fourteen

If you don't live it, it won't come out your horn.
—Bird

Things gradually settled, as they always seem to do eventually, into a routine.

At what seemed the approximate speed of mold forming on a corridor wall, life aboard the RSS *Charles Sheffield* began to take on discernible shape, and then flavor, and finally texture. Five hundred people slowly got to know one another, heard (the first version of) each other's back stories and dreams, learned each other's strengths and weaknesses, discovered what we needed and what we had to give, slowly began to design and assemble, by trial and error and what few lessons history had made clear enough, a society that would use all of us and feed all of us and give us all something to be part of for twenty uninterrupted years.

Complicating the task, of course, the society was intended to become something utterly different at the *end* of that twenty years, and needed to be kept aimed in that direction at all times. For most humans, anything farther ahead than this time next year is the "far future." It can be all too easy to lose sight of a goal that far off, and we *had* to be ready when we got there. The good news was that Merril Grossman was our Coordinator. She had a keen mind, a great understanding of her job, and a way of bullying people that was so transparently an act of love everyone let her get away with it.

Six months into the voyage, she organized and chaired the *Sheffield's* first town meeting. It had to be electronic, naturally. Any cubic large enough to have held all of us at once, even in free fall, would have been a preposterous waste of space, in a ship that never seemed to have enough. Even the Pool could barely have accommodated half of us, and only on the friendliest of terms. But a well-run ETM works *better* than a live rally in the park, and Coordinator Grossman knew how.

I mean, speeches *were* made, inevitably: we are talking about humans here. But they were kept short, and they assayed out remarkably low in bullshit content. Captain James Bean, a man who looked *exactly* like you want the captain of your starship to look, and had the reputation to back it up, got five minutes, and used three. The whole ship rocked with applause when he was done; he was well liked. Five-minute gab-slots also were awarded to Colony Governor Jaime Roberts, and to George R representing the Relativists. Another would have gone to Governor-General Lawrence Cott, representative of Kang/da Costa, but he was ill so his slot was given by his lifemate Perry Jarnell, who took six minutes. At that point his audio and video both cut out.

After that, even the most pompous speakers quickly figured out that if they hadn't gotten it said within five minutes, Merril wasn't going to let them keep trying. By the time everyone's screens went dark that night we had accomplished what I considered an astonishing amount.

Names, for one thing.

People had been arguing them for months, occasionally at a volume that drew proctors, but somehow our Coordinator cut through the confusion in a way that didn't seem to leave anyone feeling disenfranchised, and before too long we had all finally reached consensus on names for most of the places and things that would really matter to all of us when we got to Bravo.

I for one found most of the choices cheering, too—our colony seemed to be a jolly crew.

The three major continents, for example, were christened Samba, Cerveja, and Carnaval. What lay ahead we knew not, but we intended to have a good time there if we could. At the same time, once he'd explained it to everyone, Matty Jaymes's suggested name for our first settlement, Saudade, passed by a landslide, with fewer than two dozen opposed, the closest to unanimity we came that night. We all understood that our good times would always, always be seasoned with a sharp regret, a longing for all the lost loved ones and planets and habitats we had left so far behind us forever. To pretend otherwise would be foolish.

Nearly as popular a choice were the new names given to our two moons. *Nobody* had liked the unimaginative names Immega had given them, New Deimos and New Phobos. For one thing, they didn't look like their namesakes, and would not behave like them in the sky. For another, a lot of us were *from* Mars, and did not want our good times tinged with nostalgic regret every single damn time we looked at or discussed the night sky (That was one reason the two closest alternatives to Saudade—Rio de Janeiro and Niteroi—had found so few supporters, I think.)

So I'd been expecting the grassroots effort to rename the moons. But the names chosen were a pleasant surprise, from the music of the twentieth century: Tom and Joao. The great composer Antonio Carlos Jobim, known as Tom, and his great disciple Joao Gilberto between them created samba, the lush basis of all subsequent Brazilian music .

. . which became a major influence on the work of my favorite saxophonist of that period, Stan Getz. I took that as a good omen, and made a mental note to find out if Kathy knew his work with Tom and Joao. (She did—and knew a guitarist who could play Gilberto style. We killed 'em at the Horn of Plenty all that week.)

Governor-General Cott's partner had by that point leaned on somebody hard enough to get hooked back online, and expressed his co-husband's strong distaste, on behalf of our noble patrons at Kang/da Costa, for the growing tendency of some colonists to shorten the name of our new home-to-be from Brasil Novo to Bravo. His partner found it disrespectful and Jarnell found it vulgar, if I've sorted them out correctly. He stopped short of demanding prohibition of the name Bravo, but asked for a resolution agreeing that the proper name was Brasil Novo. The Brazilians aboard registered strong support.

Merril sighed and asked if anyone else wanted to address the question. A colonist named Robin Feeney spoke up, pointing out that "bravo" was a word used to applaud a feat of great difficulty, and a jump of eighty-five lightyears certainly qualified: our successful arrival would itself be a Bravo to Captain Bean and his excellent crew. That went over well. The word was also, she added, one we commonly applied to artistic effort that moved us, and as an actress and painter, she hoped hearing it often might help to remind us that the arts would have an important place even in a frontier society. Someone promptly said, "Bravo!" and was widely echoed around the ship. Merril squelched further debate, put it to a vote, and that was the end of the Cott resolution. Many of us would continue to say Brasil Novo, most of the time, because let's face it, it was more elegant. But when we did it was our choice.

More time was nearly wasted on the contentious question of just where on exactly which continent Saudade should be founded. It was a big planet. Almost none of us had an opinion, but the few who did were married to them. Fortunately before it got out of hand, Merril pointed out to us that the reason most of us had no opinion was that none of us was entitled to one. It was not yet possible to state with certainty where the best site for a colony might be: we simply didn't know enough yet. Robot probes were good, but they weren't *that* good. We would simply have to wait until we approached the Peekaboo System and could take a closer look for ourselves.

We did more than just pick names that night. Some sensible suggestions were made. Survivor Gerald Knave, for example, proposed we establish a prize of some kind for Most Constructive Complaint of the Month. Sol Short broke in to suggest we establish some sort of penalty for the *least* constructive, but Merril ruled him out of order and made it stick.

The most popular speaker of the evening was clearly the Zog. He spoke on what it was now believed our new home would be *like*, the local conditions we expected to find, some of the flora and fauna we knew about—not in any great detail, really: just enough to give a *sense* of the place. More than a few of us were still as ill-informed as I had once been, and all were spellbound by his descriptions. He made it sound exciting, enticing, mysterious. A steamy jungle planet, shrouded in mists, teeming with life as exotic as if it had been made up to entertain a child at bedtime. His description of the hoop snakes, which bit their own tails, curled up into the shape of a wheel, and then by deforming their belly muscles were able to roll along the trails carved through the jungle by the snipper beasts, had everyone chuckling. Then his straight-faced explication of the propulsive method used by the rocket slugs caused such a shipwide convulsion of laughter Merril had a hard time restoring order. For months thereafter, the words "green mist" had the power to make us crack up. I remember thinking at the time that it was the first time the entire colony had laughed together about something, and that I hoped it wouldn't be the last.

Zog even managed—don't ask me how—to make the everpresent mortal danger of fire we would face and even the threat of Hungry Ghosts seem like only bedtime-story monsters, thrilling but not truly terrifying. I think if you took a poll, most people would agree with me that Bravo Colony's history as a real rather than merely potential entity begins with the moment Kamal Zogby began to speak that night. Before that we were a big can full of smelly strangers. When he was done we knew that we were a family, and one that was going to create an entire world from scratch together one day, in an environment strikingly like the one in which humans had first evolved back on Terra, and that it was going to be an adventure. Everything we did would be legend for ten thousand years: the first legends of our planet.

There were a couple of obligatory anticlimax speeches and announcements, and then Merril closed the meeting precisely when she had said she was going to, at 2300 *Sheffield* time.

Ship's time, that is. By that point in our voyage, six months out, we were already beginning to use Dr. Einstein's Clock instead of Sol. Lorentz contraction had set in, and we were aging just measurably slower than the people we had left behind.

How much slower? Not a lot—yet. At the instant when those of us in the *Sheffield* passed the six-month mark of the trip, residents of the Solar System were only about seventeen and a half hours older than we were.

But it would get steadily worse as our velocity mounted up. And constant boost mounts up *fast.*

At the one-year mark, the differential would be about seven days and seven hours.

At two years, it would be more than fifty-eight days.

By the fiveyear mark, the divergence of our clocks and mankind's would surge up to almost three years. We would be traveling at more than 0.938c.

And when I had been traveling for ten years, and was twentyeight years old, more than *fortyfive years* would have elapsed on Terra. Behind me Jinny would be closing in on sixty-four.

And receding at 99.794 percent of the speed of light.

Then we would flip over and do the whole thing in reverse. And assuming we got it right, and made orbit around Brasil Novo as planned, we Peekaboobs would be twenty years older, and Solarians would be something like eighty-five years older. Jinny would be one hundred and three, and probably wouldn't look a day over eighty.

Time has always struck me as one of the Allegedly Intelligent Designer's ideas that was never properly beta-tested before its implementation.

I know: they say it serves to keep everything from happening at once. But what would be so bad about that? You'd get to see both the Big Bang, if there really was one, and the Heat Death, if there's going to be one. Either way at either end, you'd know. That and everything else knowable. You'd have what Adam and Eve got cheated out of, what they *thought* they were bargaining for. Gnosis.

So would everybody. No more bullshit.

Okay, so it would lack suspense. But it wouldn't lack surprise. *Everything* would be a total surprise, always.

I have a great career ahead as a consultant in the thriving field of universe design, Sol once told me. I told him he should hire me: some experts said he and his fellow Relativists generated mini-universes like soap bubbles every working day. He said the moment he got a complaint from one of them, I was the guy he would hire to do the renovation.

I don't care what Dr. Einstein says: my own clock seemed to *speed up* as the days went by. Those first few hours after leaving orbit took forever to pass. The first few days went by at a glacial pace. Then for weeks, every minute of every day brought new information, new people, new situations, new problems, new mistakes, new things to learn and unlearn. After a few months, of course, it began to slack off. At six months, I had a fair idea of where to find most of the good stuff and how to avoid most of the bad stuff, and the days started to slide by while I wasn't paying close attention, and events began to sort of lurch forward in quanta rather than unfold in a smooth flow.

Things did move forward, though. By the end of the first year, I was on my sixth girlfriend of the voyage.

I've already mentioned the first one, twice, but you probably didn't notice her go by. Robin Feeney was the female lead in the Doc Simon play I took Kathy to see, on our first and last date—the actress whose performance I was championing just before everything went to hell. When Robin spoke up at that first Town Meeting, in support of the shorthand name Bravo, I was just out of frame beside her, holding her hand and smiling encouragingly. I'm the one who said "Bravo!" first when she was done. It got me soundly kissed about two minutes after the meeting ended.

And that, I'm sorry to admit, is very damn nearly all there is to say about that relationship. That kiss may have been the high point.

If my life were a play Robin would have had to be a pivotal character, vivid and vibrant, the source of several life-changing insights, and utterer of at least one or two lines that would come back to haunt me in the third act. It was a role she was perfectly cast for, too, one she could play the hell out of. Unfortunately she had no one to write it for her—and no skill at improv. Onstage, she was vivid and vibrant. Offstage, she was usually thinking about how to be thought vivid and vibrant the next time she was onstage.

I sound like I'm implying that she was more self-centered than I, which is both unfair and untrue. In all honesty, Robin's principal attraction for me was that she was a female mammal with a body temperature of thirty-seven degrees who was willing to share my company in a social context. I certainly didn't think of it in those terms then, of course, but looking back on it I can see the most powerful emotion I felt throughout was probably relief at finally being able to get Dr. Amy off my case.

We couldn't even manage a meet-cute. She came up to me after a set at the Horn, to ask the name of the piece Kathy and I had just played. "Shaping the Curve," it was: a soprano-piano duet by a twenty-first-century composer named Colin MacDonald. I said if she gave me her address I would mail her MacDonald's own recording, and I did, and after a couple of days of increasingly chatty mail we finally made a date. That was all there was to it.

Herb says a relationship that begins without a good anecdote has no future. He may be right. Jinny and I met online at the campus bookstore, the first week of class. She asked if I had a battery wafer she could borrow, and I did. Yawn. And look how *that* turned out.

For our first date Robin and I picked a common choice: we shared Sim. And once there, the simulation we agreed on was again one of the most common options: background sharing. I showed her typical scenes of life on Ganymede, some of the places and activities that had once mattered to me. She walked me through comparable scenes of life in The Wheel, one of the smaller O'Neills, where she had been born. In my opinion it's also one of the goofier ones, an odd combination of mystical and uptight. They believe in the anthropic principle, and live communally and take entheogens, but nobody ever leaves a surface unpolished or an item out of place. I didn't express this opinion, and in return Robin was far too polite to tell me that Ganymede struck her as materialistic and sloppy. Our truth level never did improve much.

I did notice that she was a different person when we were in The (simulated) Wheel, one I think I maybe would have liked better. But she didn't.

If I want to, or need to, I can reach back into my mental file storage and pull out long stretches of footage representing just about all the major periods and significant people of my life—usually in ultradefinition video with supersaturated color, and full spectrum audio with enhanced treble and bass. In the drawers marked "Dad" and Jinny" there are extended sequences in true 3-D, complete with textured smells, and sometimes even tastes. Sadly such mental files are like analog recordings rather than digital, in that they decay slightly with each playback. At the same time, paradoxically, some of the earliest memories are the most detailed and evocative.

But when I try and retrieve memorable scenes from my relationship with Robin, what I get is a series of disjointed dim still images, like old photographs, that occasionally animate for a few seconds, with snippets of soundtrack that often fail to match the action.

There don't seem to be any inconsequential relationships in drama. I guess they don't have the time. We had *plenty* of time. If we'd been a play ourselves, and unsubsidized, we'd have closed in a week. As it was we managed to keep the house lit for months by giving away comp tickets to each other and pretending not to notice the canned applause. But the reviews were never worth clipping.

The upside, of course, is that in the end *we* were able to disengage without doing any important damage to one another. We carried on as though we had, of course, for the drama that was in it. But we gave it up soon, and with secret relief on both sides. On mine, anyway.

About a week later, as I was wandering around in a daze thinking, *Well, that wasn't as horrible as it could have been,* I had a meet-cute with Diane Levy. She did not notice me sit down next to her at dinner, tried to turn around and grab the sugar from the table behind us, and coldcocked me with her elbow. Or *was it?* I thought, and woke to find her large liquid eyes as close as one might expect to find those of a lover. Four hours later, she was one. To my complete astonishment, I had made her a thankfully unnoticed gift of my virginity.

I lay beside her gasping for air, and grateful for the excuse. What would I say to her, now? My brain settled on something or other just as my lungs returned to active duty; I opened my eyes and opened my mouth ... and discovered Diane was not at all interested in any of *those* organs.

A while later, floating on a rich postcoital sea of relief and pride and satisfaction and regret, I found the perfect words with which to let her down easy. I would simply explain, tell my story truthfully, help her see that I was damaged goods, too scarred by a tragic love to ever love again. If she then chose to take up the challenge to pursue a relationship, my conscience would be clear. (Somebody said the gray component of semen is draining brain cells. It may well be so.)

No sense dragging it out; I opened my eyes to begin her disappointment as gently as I could. And found myself alone.

For the next three days my calls reached only voicemail; my text messages went unanswered. The *Sheffield* resolutely refused to supply me with any useful data, not location of quarters, usual whereabouts, names of friends, or biographical information. The third time I tried to wheedle it, the ship threatened to rat me out to Dr. Amy if I asked again.

By that point I knew the truth. This was love.

The real thing—not the pathetic charade Jinny and I had mugged our way through, but the love of the ages, the true mystical union of two souls. I knew things about Diane that she didn't know herself, and she was going to explain me to myself, and I was absolutely certain that if she would only give me thirteen words I could make her see it all as clearly as I did. I had it down to thirteen words, so good I felt they'd have done the job even as flatscreen text—and I couldn't get a single one of them before her eyes.

The first night I just moaned a lot. The second, I raged and wept and made myself a stinking nuisance to my roommates. Balvovatz finally took it on himself to drink me under the table, and laid me out on my bunk. The third night, I went to the Horn, and laid a drunken monologue on Kathy that would damage our friendship for months to come. At the time, she limited her remarks to a polite hope that things would work out well for me, and a slap with so much wrist to it that a proctor was halfway to the table before I could wave him off.

Tossing in my comfortable bunk that night, I got it down to six words. I'd need eye contact, but if I could just get six lousy words in—

The next morning while I was in the 'fresher, paying in ugly coin for two nights' debauchery, Diane phoned.

"Diane! Uh . . . let me call you back—"

"Joel, dear, I appreciate your interest. I had a wonderful time with you. Perhaps I will again, one day. But it can't be soon. It's just simple math, dear."

"I don't understand. Look, can't I—"

"I have to make a big decision sometime in the next twenty years. It's going to affect my whole life. Obviously my information has to be as complete as possible. Even after I rule out seniors, mono-gays, and other permanent ineligibles, there are something over two hundred possible mates in the world. I like to keep my weekends for reading. So that means I'll work my way back around to you again in a little over forty weeks. Not even a year."

I stared at my wrist, and reminded myself that my guts had been churning *before* the phone had rung. "Are you telling me you've already—"

"Yes, dear, but I assure you I remember you with particular fondness." Spasm. "One day isn't long enough to—"

"I find that by the second or third day one forms attachments, don't you? At that rate I could easily take the whole *voyage* identifying the right husband. I'd still be breaking him in when we hit dirt at Bravo. You understand, I'm sure. Or rather, I hope. If so, I'll see you in forty weeks, give or take. Unless I get lucky and lightning strikes, of course." She hung up before I could wail her name. It didn't stop me.

Let's just say the next five or ten minutes stressed that 'fresher to its design limits and beyond, and leave it at that.

So I sought a mojo.

That's a term from PreCollapse times. It means a love charm. A magic spell or fetish of some kind that I could use to make Diane see her search was over.

Naturally I sought the advice of an expert. Matty Jaymes listened sympathetically to my tale of woe, nodding in all the right places. Until I named my beloved; then his face went blank, and he sat back in his chair and shook his head. "Son, I'm afraid I am powerless to help you."

"Huh? What do you mean? Why?"

"Diane made love to *me,* once." He sighed. "I spent two hours down on the Ag Deck eating dirt, before I resumed my human shape." His left foot was tapping uncontrollably on the deck. "My advice is to be thankful you weren't two hundredth on her list, and quit trying to hog a natural resource."

From there, my love life went downhill. Eventually I gave it up as a failed experiment and put my mind on my work.

Let's see. There was Barbara Manning, a student of Dr. Amy's—her suggestion—and then an engineer named Mariko Stupple—Tiger's suggestion—followed by a physics student named Darren Maeder who had the superstitious notion that perhaps something of my father's innate genius might be exuded in my sweat, or something, followed closely by his former girlfriend when I proved a dry hole—both of those his idea—and then, if I have the sequence correct, there were ...

Can I stop now? This emotional striptease not only embarrasses me, it's boring. *Everyone's* early love life is boring, sometimes even to the protagonists at the time. Let it stand that eventually the awkwardness started to wear off, and when the dust settled, I found myself a normal healthy het-bi bachelor with somewhat less than average interest in casual sex and even less interest in emotional commitment.

That described a lot of us in the *Sheffield.* There was no rush in forming a partnership that had nothing much to *do* for another couple of decades. Unless of course you decided you wanted to arrive on Bravo with children tall enough to be useful, which an unsurprising number of colonists did. But a nearly equal number concluded, as I did, that a ball of mud, even alien mud, had to be a better place to raise children than a metal can. And the last five or six years of the voyage, when things were just starting to gear up to their busiest, would be a poor time to be ass-deep in bored, surly, invincibly ignorant teenagers. Such as I was now.

Sol Short once told me mankind is divided into two basic sorts: those who find the unknown future threatening . . . and those who find it thrilling. He says the rupture between those two sides has been responsible for most of the bloodshed in history. If change threatens you, you become conservative in self-defense. If it thrills you, you become liberal in self-liberation. He says the Threateneds are frequently more successful in the short run, because they always fight dirty. But in the long run, they always lose, because Thrilled people learn and thus accomplish more.

I don't know. In those days, I would have to say my basic orientation was toward the Threatened school. I had begun life by losing a mother I never knew, except as a source of rhythmic thumping sounds and intermittent gurgling noises and comforting warmth. Then, when I was just old enough to get the full impact, I found out how infinitely much worse it is to lose a parent you know. My world had just begun to shake with the changes of puberty when it exploded in my face; at the moment I most needed adult guidance, my supply of parents dwindled to zero.

Then for a while *everything* had been change, and almost all of it had been unpleasant. I had not until then fully realized that I was odd, that there was anything strange about growing up with a single-parent genius. I thought *all* homes had equations scrawled with disc-marker across all the cabinets and walls, and clean laundry in the freezer, and defrosting chicken in the tool drawer. I thought everyone read a book a day and listened to hours of ancient music.

My father raised no wimps. I'd buckled down and got to work, examined my options, made a plan, made it work, started at last to acquire the confidence that I could get a handle on this life business just like everybody else.

And then I'd met Jinny.

So maybe you can understand that my instinctive tendency, in those early years of the voyage, was to tuck my chin down into my chest, hunch my shoulders, cover up with both forearms, and keep backpedaling. The temporary insanity with Diane was my last flirtation with grand passion and romance. After that I was more in the market for companionship, intellectual stimulation, perhaps a little cautious friendly sex every now and again, perhaps not.

I really did comprehend, intellectually at least, that I was engaged in one of the most profoundly thrilling endeavors in human history. How conservative can you be, if you've jumped off the edge of the Solar System? Do conservative people travel at relativistic speeds? By the end of the first year of our voyage, we were already traveling at more than a third of the speed of light—and even though there were no sensory cues at all to confirm that, we were all well aware of it, and believed it, and I think I can safely say we all found it more than a little thrilling. By the time we reached turnover in nine more years, our velocity was going to peak at a hair-frying 0.99794c. Does a conservative man race photons?

It wasn't that I couldn't see the future was going to be thrilling. It wasn't that I was unwilling or even reluctant to be thrilled. I just had little experience with it.

The mores and customs we had all been raised in, fruits of the Covenant, continued to work their unlikely magic: even in close and closed quarters, we found ways to live together without violence, to a large extent without malice, and with as much kindness as we could find within ourselves.

At the end of that first year, we celebrated with a party that would become so legendary I don't think I'll discuss it here. There are several detailed accounts available, and I disagree with every one of them on some of the details. One point on which there is agreement, however, is that there were no quarrels. No relationships broke up, no feuds were born. If anyone had a really bad time, they managed to conceal it from one of the best gossip networks in history.

I'm not saying there were no unhappy people aboard. A predictable percentage of us concluded, much too late, that they'd made a terrible mistake in joining the colony. A predictable few of those became merchants of gloom, prophets of doom, carriers of that most infectious of diseases, fear. And a few just became so profoundly miserable they lowered morale wherever they passed. Dr. Amy and her three colleagues had their work cut out for them.

It made me want to stop being a jerk faster, to free up her time. So I worked at it.

By the end of that first year of the voyage, I had at least a working two-part answer to the question, *Who is Joel Johnston?*

First, I was a guy who was going to sing to the stars.

I would sing with my horn and with all the other instruments of man, to a star whose very existence had been unsuspected for most of history. I would sing of human beings, since words would not do, to a star system that knew nothing of them or anything like them. I would sing of my fellow colonists, in what I hoped was a universal language, to a planet we hoped would see fit to nurture and sustain us all. And I would sing of myself—and perhaps another—to two strange new moons in the night sky, and slightly distorted constellations.

Second, I was a guy who was going to talk to strange dirt.

On the long voyage I would speak softly to alien soil, in my best approximation of its own language, asking it as politely as I could to accept Terran plants that would feed my colony. I would open negotiations with the ecosystem of Bravo, and listen intently to the responses that came back. Zog and I and all the rest of his crew would spend the years staring until our eyes watered at the probes' surface recon images of Brasil Novo's surface, trying to outguess the planet, speculating endlessly over what sorts of new predators, parasites, or other perils were most likely to exist, arguing endlessly over what we might do about them. It's difficult to plan for the unknown—all right, it's impossible—but we were going to do our level best.

It was a place to stand. Sing to new stars; speak to new dirt. Two planted legs to help keep me upright for the next couple of decades. First we love music. Then we love food. *Many* years later, we evolve high enough to love another—if we're lucky.

fifteen

The real miracle is not to walk on water, or on thin air,
but to walk on the earth!

—Thich Nhat Hanh

The second year of the voyage of the RSS *Sheffield* was eventful only by ship standards. People you don't know fell in and out of love, had and did not have babies, worked and goofed off, succeeded and failed at amusing themselves and each other, did mediocre work and accomplished minor miracles and screwed up completely, were and were not happy.

Al Mulherin, said to be the best physicist aboard, and Linda Jacobs, editor of the ship newspaper *Sheffield Steel,* were the first couple to birth a child, a boy they named Coyote, and a dozen more babies had joined the colony before the year was out.

A machinist named C. Platt got careless with a torch and became our first death. He was not widely mourned. Not even his roommates knew what the C stood for.

One of the residential decks beat all the rest at soccer, and you'd he shocked to hear which one, if you cared.

Relativist Kindred had a fairly gaudy nervous breakdown and for a couple of weeks his colleagues had to cover for him, but this had been expected and planned for and caused no difficulties. It would become a roughly annual occurrence. I think most of us colonists half expected that Peter Kindred was going to Burn Out eventually, at some point along the way—but none of his fellow Relativists did. His shift was taken by Dugald Beader, the only one of the Relativists I haven't mentioned yet, because it took me months to meet him. Dugald was sort of the backward of the flamboyantly eccentric Kindred—quiet and sane and empathetic, with a diabolical dry sense of humor. It was said that he'd been involved in the design of the *Sheffield* somehow, but he didn't talk about it.

The story of the year was probably the totally unexpected marriage of the Zog and Coordinator Grossman. Nobody had a problem with the match; they were both widely admired, and when you thought about it, they were perfect for each other. It had simply never occurred to anyone aboard that either party might have *time* for a social life, let alone an active one.

He moved into her quarters, and they honeymooned by sealing the door for a week. Zog left me in charge in his absence, high praise.

So I got to be the only one in the ship to whom Machinist Platt's death mattered much.

A proctor named Hal DeMann showed up at the Bravo farm one day, pushing a body bag on a gurney. He looked like an oldtime pirate or gunfighter, but had a warm, soothing voice, a good combination in his line of work. He explained that Colonist Platt—maybe that was what the C stood for—had left instructions that he wished his body to be recycled, so that he might always be a part of the colony's ecosystem. But old C had given no specifics as to just how this should be done, leaving the question up to the relevant authorities.

Who turned out to be me.

The problem itself was admittedly trivial. Solving it was not. There was certainly plenty of dirt to plant him in, and there were several places where he might even prove useful as fertilizer, and as a check on how Bravonian conditions would alter the usual processes of decomposition and fertilization.

But there was *not* enough dirt to plant him two meters deep. And we had long since learned that no fence is always foolproof. Having his corpse dug up and eaten by pigs or goats or dogs would technically have met the requirements of Plan's will, and I was tempted to, as the poet Buckley said, just "scoop some sand over his wig, and swoop the scene." I was fairly sure he wouldn't have complained, or even minded.

But I was *absolutely* sure I knew what the Zog would say if he came home from his honeymoon to find some of the leftovers being dragged across his Ag Deck by one of his pigs.

Devising a solution wasn't all that hard. Implementing it was. Kathy and I dug as deep a hole as we could, about a meter, and laid Platt in it. Then we stood on either side and covered the corpse over completely, me with broken glass and busted springs, she with curry powder and a spray bottle of lion urine. (Chemically simulated, of course. Zog had fetched a *lot* of odd things along from Sol.) Then we replaced *all* the dirt we'd dug up, leaving a mound of loose earth, but one that was unlikely to be disturbed.

The first problem I had with implementation of this simple solution should be obvious. Nowadays it takes something close to total destruction of the brain to beat the autodocs. I've told you the damage was done by a torch, and you know where the brain is generally kept: work it out. The smell alone was memorable.

My second problem was less gruesome, but bothered me for a longer time. When we were done with our shoveling, Kathy and I stood there for a few moments, catching our breath and thinking deep thoughts. And then as I was about to turn and walk away, she said, "Shouldn't we say something?" Phrased that way, it meant, "Shouldn't *you* say something?"

And of course I was in charge. And of course I should say something; it didn't seem right to just plant the man and go. But of course I had absolutely no idea what kind of words the deceased would have wanted, did not even know if he subscribed to one of the religions humane enough to be permitted under the Covenant or not. If nobody knew what his first initial stood for, there was no point posting a query about his metaphysics on the ship bulletin board. I had no all-purpose nondenominational homilies on tap; I had experienced only one death, and hadn't heard a word anyone had said at the funeral.

I stood there for a long time feeling inadequate, stymied by the question, hating Kathy for raising it. She waited. And finally I heard myself say, "Let the universe take note of this man's passing. Somebody should. He was one of the bravest adventurers our species ever produced: he died on the way to the stars." That night instead of sleeping I thought of better things I might have said, and said them in my head to a man I had never known.

The Zog told me I'd done well when he returned. He'd had a different spot in mind for the ship's cemetery, but was fine with the one I'd picked. I warmed to his praise. But it took me a while to stop resenting Kathy for asking that question.

Third year, third year . . . let me scan my diary.

The social bombshell of that year, beyond question, was the surprise wedding of Sol Short and Hideo Itokawa.

If the nuptials of the Zog and Merril the year before had startled everyone, this one stunned us all speechless. The Zogby-Grossman match had paired two strong people, both administrators, one quiet and the other loud. Sol and Hideo were two *extremely* powerful minds, both mavericks, one loud enough to dominate any cubic he entered and kind and hilarious enough to get away with it, and the other so impossibly quiet and still that the eye tended to subtract him. I hadn't even realized Buddhist priests were allowed to marry.

I don't believe anyone aboard opposed the match, once we thought about it. But to do that you had to first imagine it, and that took us a while.

I found out when Tenzin Itokawa asked me to play at the wedding. I don't remember what I said.

The wedding feast was a memorable blast, and there is nothing in the world duller than hearing the details of someone else's blast memories, unless you were at the same blast, so I won't recount any.

That was the kind of year it was. The most exciting event in it was not really worth recounting, to anyone who was not conceived that night.

Year Four would probably have been downright dull if it hadn't been for the Happy Disaster.

Three months into the year, the Sim Deck went down.

And stayed down, for weeks. The *Sheffield's* diagnostic systems furnished an explanation, and the six people aboard capable of understanding it all agreed that it sounded reasonable to them, but I never comprehended a word of it, and will not reproduce it here.

By that point, most of us were making fairly heavy use of Sim, for recreation and for emotional therapy and for a way to fight the growing monotony and claustrophobia of life in a great big can. If Dr. Amy or one of the other three Healers decided you were using it too much, they could limit your access, and by that third year they were starting to do so often enough that it became a subject of jokes, unhappy ones.

When the Sim hardware first failed, I worried for colony morale. It doesn't matter how huge it is: any space becomes confining if you absolutely can't escape it. Without the escape valve of assisted fantasy, I was afraid the ship would start to shrink on us. A few folks did panic, at first, and the general tension spiked.

It didn't help when Matty Jaymes had a public flameout. He had no regular partner, and Sim use was not monitored by the Healers like drug intake, so no one had really noticed as, over the years, Matty had quietly turned into a *hardcore* Sim addict. But when he was forced into withdrawal, he switched instantly to a hardcore drunk, and that became very ugly very fast. Dr. Amy did all she could, but even sober he was unmanageable, and finally she was forced to put him in his quarters: his door stopped opening for him. It was only the second time in her career that she'd ever suspended anyone's Covenant rights, and it devastated her. And upset the rest of us. Until then he had been much liked and highly respected; his collapse left everybody on edge.

But then word went around there would be an unscheduled ETM, and when we all logged in, it was Dr. Amy leading the Town Meeting. That was surprising in itself, but what she proceeded to do was probably the last thing any of us would ever have expected.

She yelled at us.

She didn't say a whole lot. She never used profanity, obscenity, or blasphemy. But what she did say was as memorable as an unexpected enema.

"If you cannot function without sucking on a holographic fantasy teat that does all your imagining for you every day of your life, what good will you be to Colonia Brasil Novo?

"It usually takes a *life-and-death* crisis to show you what you're made of, and what your neighbors are made of. Thank whatever powers you believe in that all it will cost *you* is a few weeks without your favorite soap operas.

"The overwhelming majority of your primitive ignorant ancestors managed to get through their lives without 3D-5S Simulation somehow. It must be possible, don't you think? Children in an empty playroom can amuse themselves, for Covenant's sake.

"Some say anyone who goes to the stars is a loser, running away from reality. I have never believed that of anyone aboard this ship. I'd rather not start."

Those were some of the highlights.

I guess she summed it up in her literal last word, and in the force of the exasperation with which she delivered it:

"Cope."

And do you know, later on when the dust settled, it turned out the Sim systems failure had been a *good* thing, after all—maybe even one of the luckiest things that had happened to us so far. Forced to amuse and inspire ourselves, we rose to the challenge. Social groupings of all kinds sprang up throughout the colony. Get enough people talking long enough and sooner or later someone will say something interesting or useful. Happy meetings occurred. Good conversations got held. With more time to read, we spent more thought on what might be good to read, and began to learn things. Creativity that begins with off-hours amusement soon accidentally spills over into work, and into social interaction. Weddings and less formal partnerships of all kinds spiked to record levels. The theater group acquired competition, and rose to the challenge. The ship's daycare program finally got serious—none too soon. Shipwide drug intake went *down.*

And when the system finally came back up, Sim use never did reach its previous level again, let alone exceed it.

Indeed, toward the end of the year I developed a funny suspicion about how well it had all turned out, and queried the *Sheffield* as to whether any previous starships might ever have suffered Sim failure, and discovered an overall benefit. I was absolutely certain it was physically and emotionally impossible for an untrue word to pass the lips of Dr. Amy, but for all I knew any or all of her three colleagues could have conspired to hoodwink us all for our own good. But if that was the case the ship's AI was in on the gag: it told me only nine previous ships had even carried 5S Sim gear, and none had ever experienced more than momentary failures, save for the one that had blown up.

Clever con or sheer luck—either way it was damned good luck. The colony was emotionally healthier than it had ever been as it entered its fifth year of star travel, gaining confidence in its own ability to cope. That proved useful when disaster struck.

What goes on in the Power Room of a relativistic starship like the *Sheffield?*

Maybe God knows, if She exists. The Relativists themselves aren't at all sure.

I remember I was sitting at a table at the Horn once with Herb and all five off-duty Relativists, everyone but Kindred—I can't recall what led them all to be awake at once—and Herb asked what it was like.

I'd never have had the hairs to ask, myself, and there was a silence that lasted nearly ten seconds. Then Dugald Beader shifted his pipe in his mouth and said, "It's like staring at a random-visuals screensaver until you can predict what it's going to do in the next second."

George R said, "It's like playing jai alai with fifty different opponents at once, in zero gravity, blindfolded."

London, her head on his shoulder, said, "It's like being inside a spherical mirror, in free fall, and remembering at all times where the door is."

Sol grinned. "It's like running full tilt across a tightrope in spike heels with your eyes closed while cooking an omelette with a blowtorch," he said, and turned to his husband. "Your turn, Spice. It's like . . .— "

". . . not being .....Hideo said.

"Aw, come on," Sol said. "I declare that answer void."

Hideo blinked at him, and then nodded. "Very well. It is for me like an archery exercise, in which you must first hit the bull's-eye, then hit that arrow, then hit *that* arrow, and the next, continuing until you can retrieve all your arrows with a single tug, without taking a step forward." He turned to the rest of us. "The secret," he confided, eyes twinkling, "is to aim."

Sol hooted with laughter and hugged him. "Much better."

Dugald took another crack at it. "Sometimes I think of it as looking for a hayseed in a giant needle stack."

"Oh, Duggie, that's *good,"* George R said, wincing as he mimed rummaging through needles.

His wife said, "To me it's always seemed very much like hearing a very complex unfamiliar four-part harmony in the distance, and trying to instantly, intuitively improvise fifth, sixth, and seventh harmonies."

That one boggled my own mind. Most people have trouble intuiting the third harmony.

Nobody else came up with anything better that night. But I later learned someone had asked Peter Kindred, and he'd offered two of his own, "It's like looking at a Rorschach blot until it means *everything,"* and, "It's like repairing nothingness."

None of which tells me anything.

Despite years of friendship with five Relativists, and close friendship with Sol, George R, and London, I don't know what it looks like inside the Power Room, or even the antechamber; nobody does who hasn't been inside one. The convention that has become established in film and other forms of fiction is to portray Relativists sitting before banks of instruments with lots of blinking lights, intently studying gauges and readouts, constantly making fine adjustments with levers, dials, wheels, or mice that invariably cause beeping sounds. But no such layout has ever been certified authentic, and as far as I or anyone really knows, it is equally likely that what they do in there is simply sit in meditation in a bare white cubic . . . a meter off the floor, held aloft by sheer spiritual purity. I have no idea what takes place in a Power Room, and I particularly have never been able to conceptualize what it is like in there at the moment of transition, when one's shift ends and another's begins—how that handoff is accomplished.

I am not one of those fools who believe Relativists guard their guild secrets to protect their monopoly. None of the ones I knew had an avaricious bone in their bodies. Avarice would appear incompatible with the mindset that produces a Relativist, or that a Relativist produces—a rare case of fortune bringing immense wealth to people fundamentally indifferent to it. But I have no idea why it is that they *do* discourage specific questions about their daily activities. I simply know it is their right if they choose, and they do. It is purely my own intuition that they do so to *protect* the rest of us from the knowledge, for some reason.

It may equally well be that they simply literally *can't* explain what they do—that you and I have no referents for the information, nothing in our experience that any words we know could evoke. Maybe I'm like a cat trying to understand exactly how the fish get into those little cans, or a man trying to understand women: unequipped.

For all I know, something happened in that room, every day, all day, that was simply beyond ordinary human understanding. That's the way I lean, anyway.

The one thing I'm absolutely certain of is that my last chance to ask any of the Relativists I know about such matters is gone for good. I waited too long.

Anybody who was aboard can tell you where they were and what they were doing when it happened.

Any society has such events, benchmarks in its shared history. Usually they involve great tragedy. It may be the untimely death of some universally beloved public figure, or a natural disaster of uncommon magnitude; in the old days it was most often a war, and sometimes a plague.

But in those times, war and plague were expected dangers, and survivable ones. I doubt there have been many humans in history who've known anything like the instant ice-cold horror that comes to every passenger aboard a relativistic starship when they suddenly find themselves in free fall.

Where I was that day was on Bravo Ag Deck, goofing off behind the goatshed, chewing the fat with Sol Short, while the two colonists I'd drawn as my unskilled labor that shift, John Barnstead and Adewale Akbage, listened and tried not to look awed. We were passing around a flask of wine Zog had made from the Brasilian flower Muira Puama *(Ptychopetalurn Olacoides),* which was making a very happy adjustment to Brasil Novo conditions.

I can even remember what we were talking about. At the gentle urging of Dr. Amy, and with Sol as intermediary, I had long since buried the hatchet with transportees Richie and Jules, going so far as to comp them for a night at the Horn so they could hear me play. It made a difference; Richie came backstage after to stare at the floor and say he "apollenized," and Jules put one arm around me and hugged me, and from then on whenever we encountered each other in the corridors, they were both loudly friendly.

So I had begun a small but precious collection of Richie-isms, and loved to compare specimens with Sol, who appreciated them as much as I did. That day, I recall, I had shared with him, "Don't kill the goose that laid the deviled egg," and, "You can't sell a fuckin' book by looking undercover." John threw one in, then: he'd heard someone ask the pair why they were constantly together, and Richie had said, "Two heads are better than none."

And Sol had just gifted us all with the gem "Atojiso," as in, "I knew that would happen. I hate to say atojiso, Jules, but I fuckin' atojiso," and we were roaring with appreciation, when all at once the ceiling came down to join us, and the floor fell away.

Sudden unexpected weightlessness can only mean drive failure, and this is never good news.

But if you're on a starship, it probably means you're dead. You and everyone in your world.

It is just barely possible to restart a quantum ramjet at velocities higher than 0.5c. But time is critical—and luck even more so.

It had been done. Twice before in history, in each case by a Relativist said to be particularly adept. Successfully, I mean. There had been two spectacular failures—by colleagues generally agreed to have been equally good. That was why the *Sheffield* needed a minimum of four Relativists—six hours was the longest one could reliably sustain the necessary concentration—and why it carried six. We'd have carried more, if Kang/da Costa had been able to hire more.

If the quantum ramjet was *not* restarted, and damn quickly, the *Sheffield* would literally never get anywhere. There would be plenty of power for life support—and nowhere near enough to slow all those megatons of mass appreciably. We would drift for all time through the void at more than nine-tenths of the speed of light, forever unable to decelerate to any more reasonable speed, incapable of making any port.

John and Adewale and I were none of us spacemen. We panicked. The blood did not drain from our heads because there was no gravity; but we didn't become as ruddy as we should have. We'd all been in free fall long enough to learn some basics, but none of us had free-fall instincts or reflexes. All we had was enough intelligence to understand how much trouble we were in.

The goats didn't even have that—they knew only two gradations of terror: none and total. They simply happened to be right for once. The goat shed exploded, and jagged pieces of its walls became lethal Frisbees, followed by a second wave of hay, hooves, and horns.

Miraculously, none of us was hurt by any of these. It was Solomon Short who broke my collarbone, using it to launch himself toward the stairwell, and who dislocated Adewale's shoulder using him to leapfrog, and busted John's nose when he couldn't get out of the way fast enough.

I figure I'm responsible for my concussion; I could probably have ducked that goat, if I hadn't been watching Sol dwindle in the distance. But how can you look away from somebody crying like that?

To be honest, I don't think I'd have been much help to him even if I hadn't gotten my skull kicked. I was already thinking in terms of coping with my own responsibilities: my livestock, my farm—both my farms! Everywhere, things would be going to hell, delicate hydraulic systems pumping dry, containers spilling over, lattices coming apart, koi trying to swim in damp air.

So it was John, not even particularly a friend of Sol's, who thought of it first, and did it in time, and so ended up accomplishing far more good than I would that day. The instant he had drifted within reach of something substantial enough to change his vector—a light fixture in the ceiling, still on, still hot—he used it to launch himself after Sol. He stayed close to the ceiling, and used every surface feature he passed to add speed, so he had soon built up nearly as good a head of steam as Sol had. At about that point I heard the right rear quadrant of my skull make the sound "KLOP!" and decided to take a little nap, so I missed John's triumph.

Sol had sensibly ignored the lift, beelined for the emergency stairshaft/drop-chute, and flung himself down it like a hungry ferret going down a hole. It was the mental picture of him in that ship-length tunnel, reaching ever higher velocity with the help of the handholds that were usually rungs under gravity, that had galvanized John. He was far less free-fall savvy than Sol, but massed more, so he arrived at about the same speed. He knew there was no way he'd make the turn. But he never even attempted to decelerate, just sailed into the chute, slammed against its far wall, and accepted the damage. *"FLIP! FLIP!"* he was screaming as he came through the doorway, and after he crashed and got his breath back, he resumed screaming it at the top of his lungs down that long Freudian shaft. *"FLIP, SOL! FOR CHRISSAKE, FLIP!"*

Would I have understood what he was saying, if I'd heard it? Interesting and pointless question. Adewale said later he did hear it, and didn't get it—as far as he could see, *everyone* around there had flipped.

Halfway down that stairshaft—any and all gods be thanked, once they've been cleared of any involvement in the original catastrophe—Solomon Short heard John Barnstead's scream. He was then in a kind of frenzy, or fugue state, as fixated as a heat-seeking warhead. But John had selected a word from the tactical menu used by warheads. It was a legal command, and as Sol received it he instantly saw the sense of it and obeyed. By a process that has never been properly described because everyone who's spent time in free fall knows it, and nobody who hasn't can ever understand it, Sol tumble-flipped his body end over end, and continued his plunge feet first.

John's mental process had gone more or less like so: if Sol is the first Relativist to reach the Power Room, we're all screwed. By the time *he* can get there from this far away, the ramjet will probably have been off too long to restart safely. So we must pray that another of his colleagues beats him there.

But if so, what of Sol, in the stairshaft?

Sure enough, the *Sheffield* was later able to tell me that it was less than a second after Sol stablilized in his new position that weight suddenly returned—followed a split second later by the siren blast that was supposed to give ten seconds' warning before any vector change. At once he began slapping at passing rungs to kill velocity, and looking below for his landing site. In the end, he landed with nothing worse than a sprained ankle, which became severely sprained after he ran on it.

By the time he landed, that was important. Crucial, even. Because by then George R was dead, and London was . . . was permanently out of action.

The *Sheffield* was down two Relativists, now . . . and that left us exactly enough to keep the quantum ramjet running twenty-four hours a day. There was going to be no acceptable excuse to miss a shift . . . for the next fifteen years.

What happened in the Power Room that day?

There's a lengthy report on file, which I am assured is accurate and complete; you're welcome to look it up. It's full of what look like words, arranged in sequences that seem to be sentences, and the one I come closest to understanding seems to say that the Zero Point became briefly numerable, and George R was unable to deny it. Maybe that conveys something to you; it's noise to me.

Months later, at various times, I heard Dugald Beader say that George R had "stopped surrendering," and heard a massively drunken Kindred assert that his colleague had "lost his focus." How those two things could describe the same event, I cannot imagine.

Here's what little I do understand.

First of all, George R was not supposed to be on duty that shift. Hideo was. That was why Sol lost it. But at the last minute, one of Hideo's Zen students had come to him with a spiritual crisis, and he'd asked to be replaced.

This was no big deal. By that point in the voyage, all of the Relativists had missed a shift or two; it was part of what spares were for. Hideo had probably missed fewer than anyone else but Kindred—and had extracurricular responsibilities the others lacked. If anyone was entitled to blow off a shift, it was him.

The person he was supposed to succeed was George R. When his request showed up on George R's board, George R should have messaged backup, confirmed availability, then let Hideo know he was off the hook—a total of three keystrokes. He did only the third.

Who can say what was in his mind? Of the Relativists aboard, Sol was the loudest, and Peter Kindred the most egotistical, but George R was far and away the most sheerly *confident.* There was no leader, but he was senior among equals. The backup he should have called was London. She was asleep just then, in their quarters. Perhaps he just wanted to do something nice for his wife. Maybe it was a gesture of apology to get him out of some marital doghouse. It may simply have been easier for a man as confident as him to push one key than three.

He certainly was not the first Relativist ever to work a double shift. But I think it's safe to say he was the last.

Fatigue? Monotony? Bad judgment? Bad luck? None of them ever said, and none of us ever had the balls to ask.

Something Horrible happened in there, that's all.

Whatever it was took something like thirty seconds to finish burning his brains out, and matters should have ended there. It is certain that he did not at any time trigger an alarm or send out a message of any kind. The ramjet should have failed, and then whoever won the race to the Power Room should have yanked his smoking body out of the way and, hopeably, restarted it.

I do not know how London got there before he finished dying. She knew exactly how dangerous it was to try and go in there, just then, and never hesitated. Whether she believed she could save him or simply didn't care to outlive him is not for me or anyone to say. If it was a mistake in judgment she paid dearly enough for it—with her eyesight, most of her hearing, and about eighty-five IQ points.

A rain of shit can take time to stop. It was doubtless lucky for all of us that Hideo was the next to reach the Power Room. Of all of them he most had the kind of iron discipline and diamond calm it must take to toss the smoldering bodies of two friends out in the corridor for others deal with, forget them, and try to restart a quantum ramjet. I honestly think any of them could have done it, but I'm glad it was Hideo who got the job.

But when he emerged, and had been thanked in turn by Captai Bean, Governor Roberts, Governor-General Cott, and Coordinator Grossman, Sol and Dr. Amy had to take him aside and tell him that the student he'd blown off his original shift to counsel had pieced events together, and committed suicide from guilt.

A poor reward for heroism.

Sixteen

During this period, Tesla spoke out vehemently against the new theories of Albert Einstein, insisting that energy is not contained in matter, but in the space between the particles of an atom.

—*Tesla, Master of Lightning* PBS-N documentary, Dec.12, 2000

The next few weeks were dark.

Disaster on that scale can demoralize a community—or draw it together. The crucial factor seems to be, how fast does the fear ease?

It was touch and go. Dr. Amy and her three other Healers had their work cut out for them. Coordinator Grossman and the Zog, Governor Roberts, Governor-General Cott and his partner, Chief Engineer Cunningham, even Captain Bean himself, all made a point of wandering around the ship with cheerful optimistic expressions fixed on their faces. It did help, a little. But only a little.

How do you tell someone falling through the universe at nearly the speed of a photon there's nothing to worry about? When the most valued, pampered members of the ship's company can die and worse than die, who is safe? I don't think any of us had really expected any dying to begin until we got to Bravo. Now all our lives and plans and hopes depended on four particular people remaining not only alive but healthy enough to work for every day of the next fifteen years.

And that was the heart of our darkness: theirs.

Thanks for coming in ahead of schedule, Joel," said Dr. Amy.

"No problem," I said, settling into my chair. "To tell you the truth, though, things haven't been too bad lately"

"I'm glad to hear that," she said.

"I mean, I know you must have your hands full—"

"That's what I want to talk to you about, this time."

"Crave pardon?"

"I'm going to be more blunt and candid with you than I have been with the rest of the colony, Joel."

Yikes. "Okay"

"This ship is in trouble."

I nodded. "I know"

"The morale crisis is not responding to anything we can do. I think you know why"

I nodded again. "The Relativists. The rest of us . . . colonists, adminstrators like you, crew . . . none of us can begin to heal until they do." All four stalked the corridors like golems, now, and were given as wide a Berth by all they passed. All four had politely declined to speak to a Healer, as was their right. They didn't even seem to crave each other's company. They spoke as little as possible at shift change, and less at any other time.

Her turn to nod. "They do their duty. They keep the engine running. But that's the absolute limit of their strength right now They're the heart of the ship. And they're heartsick."

"I have to say I can't blame them a bit," I said. "One of the best of them died, another wasn't as lucky—and it could happen to any one of the rest at any time. It can't be easy healing if every day you have to spend six straight hours utterly devoid of all emotions . . . in the presence of the force you most fear and hate. I'm amazed they can function at all."

"Nobody blames them, Joel."

"No—but nobody has the hairs to tell them to suck it up, and let you Healers help them."

Her shoulders relaxed. "Exactly. You do understand."

"Well, that much. What you can *do* about it, I have no idea. A year ago, I'd have said, have Matty Jaymes talk to all of them."

She nodded. "They all used to respect him a lot."

"He used to deserve it."

Matty had long since been restored to the Covenant. But the man who'd emerged from his room was not the Matty Jaymes anyone remembered. He was pale, dwindled, and taciturn, and he did not want to talk to anybody. Something had changed him, and no one had any idea what.

She grimaced ruefully "Suppose you were in my chair. Where would you *start?"*

"That's easy," I said. "With Sol. He's the linchpin, now that George R is gone. Until you turn him around, you'll never . . ." I trailed off as I realized where this had to be going.

"I agree," she said.

I held up both hands, shook my head, and shut my eyes briefly, refusing delivery with all the body language at my disposal. "No way. Don't look at me."

"Joel—"

"I *tried* already. Twice, okay? Both conversations together totaled a single word, and I didn't say it."

"Tell me about it."

"The first time I saw him after . . . afterward, I walked up to him, and we stood about a meter apart for a few moments, and after a while I opened my mouth, and he shook his head no, and I closed my mouth, and he went away."

"And the second time?"

"Two days ago. I waited outside his room, where his door couldn't see me. I had a zinger prepared. A brutal, stinging line that would shock him into paying attention to me. Use anger to invoke his fighting spirit. Healing 101. The door opened, he came out and saw me, and this time I didn't even *get* to open my mouth. 'Don't,' he said. Just that."

"How did he say it?" She was leaning forward slightly

"Way back at the dawn of video, there was a short time when animation was so expensive, they made cartoons in which little ever moved but the characters' mouths, which were real human lips superimposed on 2D drawings. He looked just like that."

She winced.

"So I just nodded, like, 'Okay, I won't.' And he gave one little gesture of a nod, like somewhere between 'Thank you,' and 'Fuck off, now' So I fucked off."

She was wearing her most empathic expression. "And now if you try a third time, without some kind of direct invitation from him, you'll lose him as a friend. I see that."

"You're good."

"How horrible for you. Okay, never mind. Thanks, Joel. I should have known you would already have tried your best. I apologize."

She stood up. We were done. I got up, too, and we gave each other the Japanese style bow that was our half-ironic custom. But I did not turn and head for the door.

"What was it you were going to suggest?"

She waved it away. "No, never mind. Thanks. Probably wouldn't have worked anyway."

"If this is reverse psychology—"

She smiled. "No. It was just an idea."

"So just tell it."

"I read a line somewhere in an old book once, to the effect that when you're really depressed, the only person you'd be glad to see coming is somebody who wants to pay an old debt."

"I don't follow."

"You've never paid Sol for his services as your advocate, four years ago. You promised him an original composition of at least fifteen minutes, on the baritone sax, with his name in the title."

She was right. I had certainly meant to do it. I'd even made a start on it, once. But what with one damn thing after another, it had fallen between the cracks, and eventually been silted over. I told myself I would have recalled my promise eventually.

"I was thinking maybe you could offer to do it now, ask him for direction, use that to get him talking. But you're right: if you raised the subject now, he'd tell you where to put your saxophone. Don't worry. I've got a few other approaches I can try. Thanks for sharing your insights with me."

I left. But when I got back to Rup-Tooey, I stayed only long enough to grab my Yanigasawa B-9930, and then headed for my studio. Now that I was a rich man, I was renting a soundproofed cubic on the lower of the two VIP decks, so I wouldn't have to inflict my saxes on my roommates.

When I got there, I had enough forethought to phone both the Zog, and Jill and Walter at the Horn of Plenty, and beg off my upcoming shifts at both jobs. Then I sealed the door and shut off phone and mail.

Three days later I switched the phone back on, called Dr. Amy, and outlined what I had. It was she who figured out how to try and put it to use.

Coming off shift, Solomon Short craved only oblivion. If he could manage to sleep twelve hours—and he could, easily—that left only six to fill. Same amount of time spent in and out of the Hole, each day. When he entered his quarters and found the sitting room full of people, he simply backed out again before the door could shut behind him.

At least he tried to. It didn't work. He encountered someone coming in the other direction, found himself back in the sitting room, heard the door dilate behind both of them.

He didn't bother to turn and find out who it was, didn't even bother to take note of exactly which assholes were cluttering up his parlor with this moronic Intervention attempt. Like a soldier removing the muzzle cap from his assault weapon and jacking one into the chamber, he slowly opened his mouth and took in air

A face was suddenly decimeters from his own. An angry, brutal, stupid face. Its mouth was already open, and had already taken in lots of air. "Shut *the* fuck up," Richie bellowed at him.

His own mouth slammed shut.

"Sit down there."

Sol sat.

Richie sat down to his right. The man behind him—Jules—took a seat at his left, and shifted his drink to his left hand. Proctor DeMann stepped across the doorway and dropped into parade rest, then softened it by taking one hand from behind him and stroking his gunfighter mustache, in the manner of one who wishes he still smoked a pipe.

And before Solomon could get himself planted, let alone prepare his first withering wisecrack, I began to play.

At first, he was so pissed off he didn't hear a thing I was playing. That was okay. I'd expected that. I kept on playing.

He tried to stop me by talking over me.

That was okay. *Nobody* can talk over a baritone saxophone. Not my silver Anna. Not even Solomon Short. I kept on playing.

With elaborately insulting body language, he stuck a finger in each ear, screwed his eyes shut, and stuck out his tongue.

That was okay. The sound struck him with renewed force again at the same instant musclebound arms were flung across him from each side, pinning him in place—so he opened his eyes just in time to watch his own fingers jammed up his nose. They released him at once. Richie leaned into his field of vision, shook his head no very slowly, and sat back. I kept on playing.

He tried making faces at people, clearly hoping to escalate to mime. He tried everyone in the room.

That was okay. Nobody would play along. I kept playing.

Finally he fell back on his last line of defense, and met my eyes, wearing an expression that said, *I don't care if you are the reincarnation of the Yardbird himself playing me a previously unknown Beiderbecke masterpiece, you aren't getting in as deep as the layer of moisture on the surface of my eyeballs, motherfucker.* Most musicians have seen that look, and it is indeed demoralizing, and Sol did it better than most.

But that was okay, too, because by the time he had it fully in place and the mortar had set, it was already starting to show tiny cracks. Because I kept on playing. And kept on playing.

It took longer to penetrate than it would have in his normal mindset. But eventually, even in his depression he couldn't help but notice that I had been playing for something like a minute and a half by now

Without stopping to breathe.

Even once.

A fellow amateur historian of music, he caught on to what I was doing faster than most would have. And in spite of himself, he started to grow interested. . . .

The technique known as "circular breathing" is in fact nothing of the sort. But it looks like it to a civilian.

If you're doing it right. This is vastly easier said than done.

I hold with the school of thought that says modern music (as they were now calling it, *again)* copied it from the Aborigines of the continent Australia, on Terra. So it could be as much as 47,000 years old—a little under a thousand *generations.* The Australian didgeridu is an immensely powerful but intrinsically limited instrument; like haiku, it finds enormous beauty within severe constraints. Denied the endless variety offered by pitch, however, it finally began to lack the bandwidth to carry concepts as sophisticated as those that some didgeridu players wished to express. There were only so many things, and combinations of things, you could do before you ran out of air and had to start a new phrase.

So they abolished breathing.

Obviously they did nothing of the sort. What they did was improve it. All the necessary parts were right there: all they had to do was train and exercise them. Not to say that was easy.

What I actually do when I "circularly breathe" is to use my cheeks as a storage bellows. It's a four-step process, that begins during exhalation:

1. As I start to run low on air, I puff my cheeks as far as possible, a configuration called a Dizzy for more than one reason.

2. I slowly contract my cheek muscles, using the air trapped in my cheeks to keep the sound coming out the other end of the pipe—while simultaneously inhaling through my nose. Very like learning to wear a Marsmask, and no harder.

3. If I've timed it right, my cheek-bellows empty out at the same time my lungs fill up. My soft palate closes, and once again it's my lungs pushing air out the horn.

4. My cheeks return to normal embouchure, until my air starts to

run low again. Repeat from 1. above.

During all this time, of course, my fingers are busy doing even more difficult things to turn all that air into pleasant sounds. They say that anybody can learn to do it . . . with enough beatings.

Anyone who's studied the saxophone has heard about circular breathing, and most of us have attempted it, and a few have persisted long enough to get it—six months of daily practice, minimum—and then played around with it a little. Hardly anyone keeps it up, once they've proved to themselves that they can do it. There's little point: the number of compositions in the database that call for it can pretty much be counted on the fingers of one foot. The last composer of merit to mess with it much was probably MacDonald, just before the Prophet took *everyone's* breath away for a century and a half; his "Thaumaturgy is definitive.

I'd developed an interest in it about a year before the Disaster—for much the same reason the Aborigines had. After many long slow years in one place, I was beginning to find my own limitations unbearably confining. First I'd fooled around with playing more than one horn at once But like everyone who tries that, I'd found that everything you can do along those lines that isn't just a gimmick was done a long time ago, by Rahsaan Roland Kirk and Sun Ra.

So I'd switched to circular breathing. It took me about three weeks just to be able to do it with *nothing in my mouth,* then three weeks more with a straw making bubbles in a cup of water. After six months, I could produce recognizable melodies on sax, and six months after that, I was just beginning to get to the point where I might have been willing to let another human hear me do it . . . when Hell broke loose in the Hole, and the roof fell in on us all. I hadn't played much music of any kind for a while after that. Nobody much wanted to hear any.

But after my conversation with Dr. Amy, I had worked continuously for seventy-two hours, getting by on catnaps and helmet rations. I had to. I already knew I was going to be half cheating Sol as it was: I did not have time to actually *compose* a fifteen-minute-long work, and was going to have to improvise something that had his name in the title. But by the Covenant, the man had asked for whatever it was to be played on Anna, and that was what he was going to get! He was the first person aboard to touch her, had brought her to me with his own hands, that first week.

Up until those last three days, all my circular breathing had been done on my *alto* sax—on which I could barely get through the nine-and-a-half-minute "Thaumaturgy."

It is *much* harder to do on a baritone—even a cherry like my silver Anna. Simple physics. A bigger volume of air has to be moved farther.

There's a finite limit to how big you can make your cheeks. The lower notes in particular require breathing *very fast,* and that's hard to hide.

(Counterintuitively, it is also harder to do circular breathing on a tenor, and perhaps hardest on a soprano, because of the increased lip pressure required. This is not a paradox: the universe just hates musicians. Envy, I think.)

I'd finally found a way to fake it, but I don't think I can describe it. What it *feels* like I do is to use my sinus cavities as auxiliary bellows, somehow isolating them from the nasal-inhalation pipeline, but Dr. Amy assured me that's just not possible. I asked how I was doing it, then, and she said she'd need to saw my head in half while I was doing it to tell me; would I care to book an appointment?

So I had his attention, finally.

Sol was knowledgeable enough to recognize circular breathing, and he was sophisticated enough about the physics of wind instruments to realize how insanely hard it must be to do it on a baritone, and he loved Anna's voice as much as I did, and its sheer power in such a small enclosed cubic was enormous, and I was playing my heart out. I simply overwhelmed his indifference shields, denied him the power of denial, forced him to listen to what I was playing.

I was playing phrases that did not end.

We call them phrases because there's only so long they can be. Some go so far as to say that the pauses between the notes are the most important parts of the music. Sooner or later even the most complex phrase dies—to be phoenix-reborn a moment later, in the next phrase. This happens even with instruments not constrained by breath or any other limitation. Most music unconsciously echoes the generational nature of human creation, death at either end of every life, an instant of silence before and after each new melody.

I played melodies and themes and motifs that did not end, but flowed endlessly, one into the next without pause, without rest, without hesitation.

At first I underlined that, by playing what first seemed to be conventional sequences, building naturally toward inevitable ending places—that always took an unexpected left turn just before they got there, and turned out to have actually been leadins to some *different* familiar series.

Once I saw in his eyes that he got it, I abandoned all convention and just played.

I forgot everything I knew about composition, reattained what Zen people call beginner's mind, acquired once again the mighty power of ignorance. I shut down most of my brain, except for the part way back by the stem that knows how to make a saxophone work, and gave control of it over directly to my heart. I learned what I was going to play at the same instant Sol and the others did: as it emerged.

If what I played had had lyrics, they would have had to be "luck Death," repeated in every human tongue ever spoken.

I blew phrases that *refused* to end. A structure that climbed as stubbornly and relentlessly and defiantly as the one at Babel rose up from the bell of my horn. I stated a theme that had no resolution and sought none, and proved that it needed none. George R was woven in and out of it—a face whose only expression was a smile. So was London—the London we had known, whose laugh required a baritone sax to do it justice. So were both my parents. Machinist C. Platt made an appearance.

Einstein said, "People like us, who believe in physics, know that the distinction between past, present, and future is only a stubbornly persistent illusion."

I dispelled it.

I did not take my eyes away from those of Solomon Short once. Until I saw, in his eyes, that I had won. That I had penetrated deep enough. I had *forced* him to see that he could feel, and not die of it. It was like watching a man in agony as the morphine hits.

Have you ever had a serious fever? The misery seems not only to last forever, but to have lasted forever—and then it goes on like that for days. But there comes a point when some kind of knot inside suddenly lets go—at the base of the throat, it feels like—and something starts to ease, or melt, or release. It's a little like drifting off to sleep, only it leaves you more conscious. At first you can't believe it, and then for a time you're tearful with gratitude, and about ten minutes later you're demanding food and the remote control.

I held on until the tearful-with-gratitude stage. I've mentioned my unusually accurate time sense. I knew when I'd been playing for fifteen minutes. At sixteen, I yanked the mouthpiece from my lips, chopping off short in the midst of an ascending arpeggio. It took me a ridiculous number of seconds to remember how to take in air by mouth.

Sol didn't notice. His eyes stayed closed. At the unexpected cessation of sound he first froze, then slumped slightly.

When I had enough control back, I said formally, "The name of that piece is 'Sol keeps Shining.'"

Nobody said a word or moved a muscle. Except me, getting my breath all the way back and unkinking my neck.

For maybe thirty seconds he moved nothing but his nostrils and chest, so long that I was beginning to wonder if he had entered meditation.

He sat up straight then, and opened his eyes, and looked into mine, and said, "Okay."

Anna and I bowed.

He turned to meet Dr. Amy's gaze. "All right," he told her. "I will." She nodded. "I know, Solomon."

He addressed the room. "Thank you. You are all good people." He turned back to me. "Except you. You haven't even left us the option of saying 'I'm breathless,' you hammy bastard."

"I could throttle you," I offered.

"Well, you're probably not the only one who's had that idea lately," he admitted.

"I've *never* been the only one with that idea," I assured him, and noticed I was leaking tears. It didn't seem to be a problem.

The old Solomon Short lopsided grin lit the room. "Look—"

"Yes," I said. "We *will* excuse you. Love to Hideo."

He nodded, and stood up. He bent slightly, looked up to me for permission, and kissed Anna on her upper lip. Then he straightened, and without asking my opinion kissed me firmly and wickedly on the mouth. Hal opened the door for him, and he left at once.

I started feeling better immediately. It took him four days to finish bringing the other three Relativists around—Peter Kindred took the longest—but the outcome was never in doubt from the moment when he told Dr. Amy, "Okay."

Word got around.

The next morning, at the Horn, I looked up from my breakfast to find a complete stranger a meter away, seeking to be noticed but looking sheepish. He wanted to know if he could have a copy of "Sol Keeps Shining." I hadn't thought about it, but found I didn't need to. "You've come to the wrong window, cousin," I told him. "That piece and that recording both belong to Solomon Short. It was a work-for-hire, performed in his private cubic, and I've waived moral rights. I don't even have a copy myself."

He thanked me and went away, and later that day, my mailbox began to overflow with copies of "Sol Keeps Shining," at least half sent by people I'd never met. Over the next few days, I started hearing it played all over the ship.

Later that day, Dr. Amy came down to Rup-Tooey to hug me. She pretended not to see my tears.

Strangers stopped to bow to me in the corridors. The sets I played at the Horn became full houses, of people who had come to listen. In a musician's ultimate wet dream, I was literally *commanded* by my community to formally release an album of my work, so that I could sign copies of it for them.

One of Kathy's husbands, Paul Barr, recorded and mixed it. My backup was her, a bass player named Carol Gregg, Garret Amis on guitar, and a utility infielder named Doc Kuggs filling in on this and that. Richie and Jules handled the mechanics of burning, packaging, and marketing, robbing me no more than an honest ten percent. I called it *On the Road to the Stars,* and included a reinterpretation of that tune.

Shortly after that Herb came up to me, grinning like a Viking after the plunder but before the rape, to inform me that a VIP of the Apple empire back on Terra wanted to know who represented me. Badly enough to pay a fortune for telepathy rather than wait 2.85 years for an answer by laser. I got Paul Hattori to represent me, and three months later my album reached number seven in the Inner System chart, and number three in the Outer. It would have time to win one major critics' award, as well. I couldn't help but wonder what Jinny thought of it. But not hard, or for long. I was busy. Come to find out, a saxophone hero in a small town has absolutely no trouble getting all the dates he wants, on whatever terms suit him. Who knew?

After a few brief holy-shit experiments, I think I did pretty well resisting the temptation to be a jerk and abuse it. I kept remembering that I was always going to live in a small glass-walled town with all these people. Leaving town or planet and reinventing myself was no longer an option.

But I did have me some fun, I did. Herb actually stopped clucking over me.

Immense wealth, creative validation, Systemwide fame without any downside, personal popularity, emotional support, great sex—if I'd had any idea how much fun it would turn out to be, I'd have leaped off a cliff *years* earlier.

It only underlined things when word reached us that the long-threatened trade war had finally broken out between Ganymede and Luna, and I discovered that I did not give the least particle of a damn.

Some of the more panicky newsnitwits hack there were shrilly predicting that the conflict would not only metastasize and become Systemic, but would finally trigger the "inevitable" return of armed violence to human affairs, and destroy the Covenant. Of course they'd been saying similar things as long as I could remember, and for every one of the nearly two hundred years since the last recorded shooting war. But even when I ran it through as a hypothetical—no behavior is beyond human beings—I was mildly surprised to find how little it worried me.

Was I really that self-centered and callous? Screw you, Jack, I'm all right? I *knew* people back there. Nice people, who would feel great pain if someone shot them, and feel worse pain if they shot someone. Didn't I care about them?

Sure. Theoretically. But I think we can only really worry about things that, deep down, we believe we could *do* something about, if we tried. I could no more affect the Solar System than I could events in Sparta, or the Land of Oz. My friends on Ganymede were going to have to look out for themselves. So were my friends on Terra, and in Luna.

I did arrange for a few musicians I knew to get their demos listened to at Apple. But I knew as I did it that it was a message in a bottle, and would probably be my last contact with the Solar System. And unless any of them could afford to spring for telepathy, it was going to be something like five years at a minimum before I could possibly hear any results. They would crawl after us at the speed of light, and we were moving at well over ninety-five percent of that ourselves by now.

Psychologically, I was already becoming a Brasil Novan.

And I wasn't the only one. As we entered our sixth year, most of us had experienced similar changes. Hits at the ship's System News website registered a steady decline, without reference to the juiciness of the headlines or sexual attractiveness of those depicted. Mail traffic to sternward showed a similar trend curve.

Terra, Luna, the O'Neills, Mars, Ganymede, the Belt—all of them had become The Old Country. To our children, some of them now three years old, they weren't even going to be that. When they grew up they'd have trouble keeping them all straight. "I forget, Dad—was surfing invented on Mars, or Luna? I can never remember which one of you had to live inside of." All but a handful of their own children would possess such information for only one week of their lives, right before final exam week, and then discard it forever with no ill effect.

We not only started to realize that, we started to be okay with it.

We began in subtle ways to function less like a collection of random refugees in a temporary shelter, and more like a community.

There was a fairly long period in its history when Canada was a collection of isolated outposts, its citizens separated by vast gulfs of uninhabitable space and incompatible regional interests, even different languages. Yet they found it possible to maintain a solid, workable sense of national identity based on little more than unusual pleasantness and a shared loathing of their national airline's coffee.

In the *Sheffield,* it was green mist jokes and shared loathing of rabbit meat in all forms. And, eventually, all things rabbity. Any joke that ended with a bunny covered in green mist was a surefire laugh.

Nations have been founded on worse.

I don't suppose many of us really despised rabbit as much as we affected to. But it is a virtually fatless meat, pretty boring no matter how you cook it, even in a ship with good air pressure. And rabbits lend themselves to jokes. Few of us like a coward.

And there were ancillary benefits at which one did not *have* to turn up one's nose, for a change: if you rejected rabbit meat, you either ate syntho—unsatisfying—or you were a vegetarian until the livestock got decanted at Bravo. And while vegetarians fart twice as much as carnivores, *the farts smell ten percent as bad,* or less. There was a noticeable net improvement in . . . ambience, shipwide.

Things were actually starting to look pretty good, just before everything blew up.

Well, very damn near everything.

Seventeen

My opinions as to the future of Mankind are hedged in by this statement: I think it is necessary for the human race to establish colonies off this planet

—Admiral Caleb Saunders, interview, Butler, MO, USA, Terra July 7,1987 ("Anson MacDonald Day")

You know the date. Everyone does. Everyone always will. If we're lucky.

Everyone everywhere has their own story. For me, this is the way the world ended. Not with a whim, but with a banker.

Paul Hattori was a closet soap fiend. We had dozens of them aboard, I had been surprised to discover. But I guess Paul felt an addiction that silly was beneath his dignity as colony banker. I only knew about it because I spent more time than anyone else in Herb's company.

The phenomenon was perfectly predictable, when you thought about it; I simply never had until I encountered it.

Imagine you are a devoted fan—a much politer term than "addict"—of a daily soap opera. One of the real classics, let's say, *Corry*, or *The Sands of Mars*. And you happen to be on a starship, boosting at a steady one-third gee.

After an arbitrary time . . . let's pick 6.41 years. After six years and 150 days of such acceleration, you are traveling at 0.976 *c*. Naturally you are impressed.

But you're also frustrated. Because while it's been six years and change for you, *thirteen* years have elapsed back in the System. A full six years and 215 days of *Corry* episodes—representing more than the total time you've been traveling—exist, are in the can, and have been seen by billions of people. But you are going to have to wait *forever* to find out what has happened to all your favorite imaginary friends. You're outracing the news.

Unless you know a telepath you can go lean on. He's your one and only source of series cheat sheets.

Paul arrived at Rup-Tooey that afternoon just as Herb was saying goodbye to navigator Mort Alexander and roboticist Guy Atari, who were collaborating on a book and had sought his professional counsel. It had boiled down to "don't," but they left undiscouraged. Paul got there in time to hear Herb's final words of advice: "If you really don't mind doing twice the work for half the money, we should all get together for poker sometime."

"Weren't you a bit hard on them?" Paul asked as the door dilated behind them. He took a seat near Herb's desk and facing my bed, where I sprawled in lazy comfort reading a biography of Johnny Hodges. We nodded to each other, and I collapsed the display and sat up; I had come to like Paul.

Herb said, "Anyone who can possibly be discouraged from writing should be." He shuddered slightly. "Besides, the idea of sharing a keypad freaks me out. I'd rather share a toothbrush."

"I feel the same about my saxophones," I said.

"I feel the same way about money," Paul said, deadpan.

"Philistine," I said.

Herb frowned. "Please—let's not corrupt the language. It's pronounced, 'Fill a stein,' and I agree, it's the least he can do."

Paul sighed theatrically, got up, and went to the fridge, one of several improvements I'd had made to the room. "You, Joel?"

"Sure," I said. "I presume you're here for your fix."

"Can you squeeze me in today, Herb? It's been a month."

Herb's telepathic time had always been pretty heavily booked, and got more so as the voyage went on, and the amount of information that only he and his colleagues Stephanie Gaskin and Gene Rubbicco could supply increased. By now it was a distinct nuisance for Herb to fit things as frivolous as soap opera synopses into his traffic load. But as a nicotinic he did empathize with addiction. And Paul was the recipient of something like a quarter of his usual, official daily traffic. "Yes—but only because I've just thought of a pun so hideous I've basically lost the will to live."

Paul brought each of us an opened container of beer, and sat down with one of his own. (There *were* real glass steins aboard—packed deep in the hold, so we'd still have them when we reached Bravo.) "Okay, I'm seated, and I have beer. Go ahead." He flinched anticipatorily.

"You spend half your working day staring at the stock situation, concerned about corn futures. Then you come here and pester me so you can get caught up on stock situations and corny futures."

I groaned. Paul's nostrils flared. "If you're calling Corry corny, ya dozey pillock, I'm glad I pissed in that beer."

"I was referring to the ethanol served at the Rover's Return, wanker." Paul relaxed. "Ah well, ethanol sterilizes anything."

I said, "If that were true, the human race would have died out a long time ago."

"And there'd never have been a second generation of Irishmen," Herb agreed.

Weird, now, remembering that was the last thing I said that morning. Reality can get away with things you'd never buy in fiction.

"I really appreciate it, Herb," Paul said. "How late should I come by, tonight?"

Herb checked the time. "Stick around; you can take it with you. I was just about to log on. I always put private stuff first, so if anyone runs out of time, it ain't me."

"Are you sure?" Paul said. "I wouldn't want to . . . intrude."

"You *can't.*"

"Well, 'distract,' then. Extra work—"

"Got your keypad on you?"

"Sure." He took it from his belt and opened it.

"Give it here," Herb said. "I'll type the data into it, then just toss it to you and keep going on my own. No extra mousing required."

"Okay. Thanks." He opened the display, accessed his mail account, collapsed the display again, and tossed the keypad to Herb.

Herb set it on his desk without bothering *to* reopen the display. He reconfigured his chair for maximum long-term comfort, and placed his beer where he could reach it with his weaker typing hand.

"You're sure my being here won't . . . I don't know, disturb your concentration?"

I snickered.

"Not if you set yourself on fire," Herb assured him. "Be alert: this keypad is just going to suddenly come flying in your general direction, and I can't predict vector."

"This is really nice of you."

"Remember that when I'm on my knees, begging you for a loan," Herb said. "See you later, gentlemen."

He found home row on Paul's keypad, closed his eyes, and went away. An indescribable series of expressions passed across his face in only a few seconds, ending in a wry grin. He began typing so rapidly, it was as if the inefficient QWERTY layout were the only thing keeping him from typing too fast for the electrons to keep up, and jamming the machine.

We watched him together for maybe half a minute.

"God, look at his face," Paul whispered then. "Transcendence. I'd give anything for his gift." That was the last thing *he* said. I swear.

I was going to tell him that he didn't need to whisper, that he could sing it at the top of his lungs while I accompanied him on tenor. But just then we both saw Herb's face change. Saw the transcendence start to drain out of it.

First he frowned. Then he stopped typing, became still. He started to inhale. His jaw dropped, slowly and steadily. His eyebrows lurched upward, in stages. Surprise. Amazement. Astonishment. The rising brows dragged open his eyes, and they widened in more rapid stages. Alarm. Dismay. Fear. Panic. Terror. Horror. Disbelief. Awe.

It took a total of maybe ten seconds. Maybe less. I will never forget a picosecond of it.

Paul and I knew something was terribly wrong. The color had drained from his face, veins writhed on his forehead like cooking pasta, cords of muscle stood out on his neck. My only wild hypothesis was that he was having a stroke. By now his gaping mouth had sucked a huge volume of air into his lungs. I was afraid it might never leave.

And then was horrified when it did. It may have been the worst sound that ever left a human throat. And he had very big lungs. The devil himself would take pity on a man who screamed like that.

Perhaps he did: the room's microphones all blew out after only a second or two, and that scrambled the video feed as well. You've seen and heard the surviving footage, and you know how indelibly soul-searing those couple of seconds are. It went on for a good fifteen seconds. I heard the whole thing, live, four meters away in an enclosed cubic, and it did not deafen me near as much as I wished it would.

It started out as a scream of pain, very quickly escalated to mindless agony, stayed there for what seemed like a million years, mutated into despair, and then in its final seconds added in powerful undertones of unimaginable heartbreak, unendurable regret, insupportable grief.

I had absolutely no idea what had happened. I just knew it was the worst thing ever. And it was.

We weren't the only ones to hear a scream like that, either. Not even the only ones aboard.

By the time it dawned on me that Paul could help me carry Herb, I'd left him way too far behind. "Call Dr. Amy," I brayed, and lurched on.

From Rup-Tooey to the elevator—nearly the ship's radius. Black spots. Upward five decks, at the speed of capillary action. Ears pounding. From the elevator to the Infirmary, only about half a radius, but with a complicated route. Bad design. Red spots, now. Got lost and had to backtrack. Made mental note: sob the moment you can spare the air. Spotted big red "ER" and red cross ahead, just as vision began to dither out. Kept going, confident door would get out of my way.

I presume it did, but something hard just beyond it did not. I felt the impact, realized I had lost my horizon somewhere, let go of Herb, bawled, "Take him!" and waited with mild interest to learn whether would injure my face or the back of my head.

The answer was both, but I did not find out for some time. It was the back of my head that hit first, and it hit hard enough to bounce. That was unfortunate, because just then Herb landed on my face. They say my skull made a much louder sound the second time.

I want to be clear: the problem was not shortage of autodocs—the *Sheffield* stocked two hundred, which someone had calculated should last five hundred people until they could build their own. It wasn't even a shortage of autodocs warmed up and ready *to* use. Four casualties at one time didn't even begin to strain the resources Dr. Amy had in place. And while many parts of the *Sheffield's* infrastructure were underspecified or even shoddy, she had made damned sure medicine was not one of them: those were 'docs fit for the Prophet's generals.

It was nobody's fault. It was confusion, that's all. Everyone in that room was probably as saturated with excess adrenaline as I was or more, and most of them had more than a single emergency to deal with at once. Only one of them knew me well enough to even be in a position to infer how *far* I had probably just run as fast as I could, carrying a man who outweighed me by more than thirty-five kilos. And not only was she the busiest person in the room, she already knew, as almost no one else did, what had happened to cause all this. It is remarkable that she was able to function at all, and she dealt more than competently with the three acute patients she knew about.

Nobody noticed for a while that I had died, that's all.

Obviously, somebody did catch on before I passed the critical threshold. And those really were top of the line 'docs. I was never in any real danger. But Herb and his colleagues had already been discharged by the time mine decided to decant me.

I woke as the lid unsealed, opened my eyes to see Solomon Short seated a few meters from my 'doc, looking at me. His face was distant, unreadable. As he saw that I was awake, his eyes hardened. He got up and came to my bedside. He looked so solemn I was about to tease him, when I suddenly noticed his lower lip trembling.

He leaned close, looked me in the eye, and said, without a trace of humor, "If you die one more time, I will be very angry with you. Do you understand?"

"How's Herb? I *died?"*

He straightened and nodded. "A little bit, yeah."

"Wow. How's—"

"He's all right physically"

An LCD lit yellow next to me, on a panel inside the 'doc. "And otherwise?"

"Dr. Louis is the best there is."

As I thought about what that statement said, and what it didn't say, the yellow light turned amber. I knew that wasn't good, and started doing my quartered-breathing trick. By the first exhalation, the light had dropped back to yellow. "Li died, didn't she? His twin? While they were in rapport." The light went out.

"Everybody did," Sol said. "Almost." He turned away and began pacing slowly around the room.

I assumed he spoke metaphorically: all of us aboard shared Herb's pain. His voice was as odd as his words.

"Covenant, how horrible for him!" Involuntarily imagining what it must have been like for him, to share his twin sister's death, turned my panel light yellow again. I focused on my breathing, tried to force the image from my mind, but the light stayed on. "What did she die of?"

He hesitated a moment, his back to me. "Let's talk about it later."

"That bad?"

"Worse." He resumed his pacing.

It was beginning to dawn on me that Solomon Short had spoken seven sentences in a row to me without a single funny thing. "Sol, what's wrong? Is Herb brain dead? Did somebody else aboard die?"

"No one on this ship has died, physically or mentally," he said.

"Okay, what is it then? Why are you acting so weird?"

"Let's talk about it later," he said dully

"Why? Look at me."

"You're not ready"

I sat up on that one, yellow light or no yellow light. "I'd like a second opinion on that," I said. "Come to think of it, where the hell is Dr. Amy, anyway? Why isn't she here?"

"She is," he said, and pointed.

I followed his finger. Dr. Amy was in the autodoc next to mine.

I had never before seen anyone in a 'doc with any sort of facial expression whatsoever. Hers looked as if it weren't working, as if she were in serious pain in there. That was silly, and a glance at the monitors confirmed it, but still

"Prophet's dick, Solomon, what's wrong? What is going on? I want to know now." Yellow became amber.

For the first time he smiled—and I was very sorry. It was a ghastly parody "Of course you do," he said softly.

He came back to my bedside, and to my astonishment and alarm, reached into the 'doc and took both my hands in his, captured both my eyes with his. "This will sound crazy. Because it is. I swear to you it's true."

"Okay."

"Sol is gone."

Was he telling me that he had gone insane? Or that he was an alien who had taken over my friend's body? Did it make a difference? Had *he* put Dr. Amy in that autodoc?

All that went through my mind in the second that it took him to see my incomprehension in my eyes, and to realize that for the first time in his life he had failed to notice an obvious pun.

"Not me," he said. "My namesake. The star."

He wasn't helping. "What the *fuck* are you—"

"Joel, Sol has exploded. It's gone. The whole System is gone. What isn't annihilated is sterilized."

I must have gaped at him. "Don't be silly. The sun can't explode! Gs don't go nova. They don't have the materials. It simply isn't—"

"I know," he interrupted. "I know that."

"But—then—I—what are you saying? Did a, did a black hole, or a neutron star, or a, a, some extrasolar—but that's *silly!* It would have been detected, we'd have known about it *long* before it got to . . ." I trailed off, confounded.

"I'm telling you Sol exploded. I know it can't happen. It did anyway"

"What?"

"I'm telling you everyone we left behind us is dead. Clear out to the Oort Cloud by now All that's left in the universe of the human race is nineteen colonies. Excuse me, twenty; I was forgetting the *New Frontiers."*

By now the literal meaning of his words, at least, had reached me. "You're serious. You *can't* be serious. The sun *blew up?"*

He could shrug with just his face. "The one we used to use, yeah."

"Bullshit. How—how can that possibly be? It has to be the most studied star in the universe! How could they conceivably fail to notice an instability so—" I was distracted by a pulsing in my peripheral vision, took my eyes from his, and saw that my panel light was now bright ruby red, and blinking.

Sol said, "I see only two possibilities. First, it could be there is some fundamental and monumental mistake in our understanding of stellar processes. A true scientist *never* says, 'That cannot have happened.' The most he can say is, 'This is the first instance of that I have observed, and I cannot account for it.'" He let go of my hands, and spread his. "Maybe G2s *do* explode sometimes. This one did."

"Sol, we've been looking closely at the stars for half a fucking millennium—"

He nodded. "And it is perfectly possible that G2s explode at a rate of one a millennium or less. That may turn out to be the clue that leads to an explanation one day."

"What does Matty say?"

He pointed farther down the row of autodoc capsules. "He's over there. Sedated."

"Prophet!"

"He said he's been half expecting it for six years. Something about observations he made as we were leaving the System, that nobody would have believed without backup, and nobody else was in a position to repeat."

"That's what's been chewing his guts?"

"It'd chew mine."

My mind rejected Matty's problem. I could tell it was going to take a lot of time to imagine what it must have been like to have known about this, for years, and been unable to do anything about it. I was busy now.

"You said two possibilities. What's the other one?"

His face became as perfectly expressionless as Dr. Amy's should have been. Except the eyes, they looked as haunted as hers. "Just before Hal disarmed him and put him out, the last thing Matty was screaming was, The paradox is fucking resolved, Enrico! I told you so!' "

"What?"

His meaning slowly percolated in.

Enrico Fermi asked, Where is *everybody?*

If intelligent life can arise once, it must arise more than once. There must be other star-going civilizations, lots of them. Where are they all?

Answer: maybe laying up in the tall bushes. Behind cover, wearing camo gear and face paint. Slowly and methodically quartering the battlefield through sniperscopes. Looking for game big enough to be tasty, but stupid enough to step out on the plain and start yelling, "Yoo hoo! Anybody out there?" Every millennium or so, one gets lucky.

I rejected the question, as I had Matty's torment. The *emotional impact* was just beginning to arrive, then. To start arriving.

It started to sink in that everyone I knew who wasn't aboard this ship was dead. Irretrievably, beyond any resuscitation, even if anyone were left to resuscitate them. *Everybody,* from Terra to Pluto. Everyone from the Secretary General of the System down to whoever ranked lowest in Coventry—hell, down to the last virus. Dead and already cremated. Tens of billions of human beings. Martians. Venerian dragons. All animals of all planets, cooked. All birds, baked in a pie. All fish, fried. Uncountable lower life-forms gone extinct ahead of schedule.

Lucky humanity. The cockroach did not outlive it after all. We had none aboard.

I started to ask how we even knew what had happened, when death must have arrived out of the sky before any possible warning could be given or received. But before I got the question completed, I knew the answer.

Two of the System halves of the *Sheffield's* three telepath pairs had, for obvious reasons, been well paid to locate themselves equidistantly around Terra. One of them, Herb's sister, must have chanced to be on the nightside of Terra. Perhaps with several minutes of useless warning, before the wave of superheated steam arrived at well below lightspeed—

I glanced down. There were three lights on the panel, now, all ruby red, all flashing.

And the third System twin, I recalled, had lived at the north pole of Ganymede, which could easily have been in the blast shadow of Jupiter. I found myself trying to picture what Jupiter must have looked like from behind as she was being destroyed by her bigger sister. The nature of the cataclysm must have been as unmistakable as it was inconceivable.

And the precise relative timing of the two telepathic reports would have nailed it down.

At *that* point it started to sink in that everyone I *cared about* who was not aboard this ship was dead. Friends, relatives, teachers, colleagues, acquaintances, people I'd always intended to look up one day

The ruby lights were slightly out of synch. The rhythmic interplay was very interesting. It gave me an idea. I wished I had a sax with me. I looked up at Solomon, with the vague intention of asking him to fetch me one, and the moment I saw his face, the final punch arrived. The others had all been solid, bare-knuckled lefts, but this was the big right hand, square in the heart.

Jinny was dead.

Not "dead to me." Not hypothetically dead, at some future time. Dead.

The moment I'd stepped aboard a relativistic starship without her, I had known and accepted that I would now probably outlive Jinny by many years. When I arrived at Brasil Novo, still just on the sunny side of forty, ninety years would have elapsed on Terra, and Jinny would be—

Absurdly, my brain actually did the math.

—ash, seventy-nine years cold.

If she had taken me up on my offer—my plea—and come aboard with me, to homestead in the stars . . . she'd have lived.

I discovered that Solomon was holding my head against his chest. I hadn't even noticed him approach. I pulled back, found his eyes, and smiled broadly.

Doing Richie, I said, "I hate to say atojiso, Jinny, but I fuckin' atojiso."

But I couldn't hear a word I was saying. Some asshole was playing a tenor too loud. Probably Philip Glass's first piece: the same note endlessly repeated. *Beep! Beep! Beep! Beep! Beep!* I didn't *give* a fucking fly how many measures he waited before he varied it, and I tried to ask Sol to durn it town. But Sol's eyes were widening. Kept widening until they covered his whole face and met around the back. Pupils turned yellow, became big yolks, and not very funny ones, either. Felt him laying me back down in the autodoc. Splendid old James Raymond song. *"Lay me down* in *the river, and* wash *my self away. Break me down like* sand from *a stone. Maybe I'll be whole again one day."* Lay me down ...

The lid of the autocoffin closed over me, and washed my self away

Eighteen

We need to have as many baskets for our eggs as possible. Even if we don't manage to ruin this planet ourselves, natural disasters or changes—or even changes in our star—could make it impossible to live on this planet.

—Philosopher Anson MacDonald, radio interview, Butler, MO, USA, Terra, July 7, 1987 ("Anson MacDonald Day')

When I did emerge from the Infirmary, nothing had changed, and everything was different.

I had once read a book, a whole book, about what it was like to be in New York City during the week following the 2001 terrorist attack. So none of the things I saw surprised me. I'd just never expected to see them with my own eyes. Not everywhere I looked.

I suppose by definition there had never been a more emotionally traumatized bunch of people in history before. We were the first sons and daughters of Terra, grandchildren of Sol, who had ever *literally* lost everything but what we were carrying. Our ancestral womb was gone. *All* our home planets were gone. Our civilization was gone. Our *star* was gone.

There was no precedent for processing something like that. No appropriate ritual. No traditional therapy.

Not one human religion had ever even contemplated such a turn of events—not even the old, psychotically bloodthirsty ones we'd had to eliminate. It upstaged Ragnarok, dwarfed Armageddon, mocked Apocalypse, overshadowed the Qiyamah, outdid the Kali Yuga, ruined the prophecy of Maitreya Buddha.

The center of the universe appeared to be somewhere *else.* The possibility had occurred to hardly anyone, ever.

By the time my 'doc decanted me for the second time, forty-seven of my fellow colonists had committed suicide, by an assortment of means.

That there were so few as that is a testament to the professional skills of Dr. Amy and her staff . . . and I think in equal measure a testament to the regard in which she personally was held on board the *Sheffield.* Several people told me later they had wanted badly to leave, but decided in the end that they could not disappoint her that way.

But I think it's fair to say that better than half of us still warm were basket cases. Walking wounded. On my way back down from the Infirmary to Rup-Tooey, at least four times I passed adults who were just sitting on the deck, weeping. Very few people I encountered acknowledged me, or even seemed to see me. Nobody smiled or spoke. I went by a room whose door was frozen open; its interior showed extensive fire damage. There was a long line outside the Sim chamber, and hardly anyone on it was talking while they waited. There was an equally long line outside the ship's nondenominational chapel—but as I passed within fifty meters of it, a fistfight apparently broke out inside. I kept going, and a few seconds later had to lunge out of the way of Proctors DeMann and Jim Roberts to avoid being trampled. I did not go in The Better 'Ole, one of the two free taverns, but passed near enough to it to note that it too was packed, with a silent and morose crowd. The only thing audible was soft music. As I went by, Second Officer Silver lurched out into the corridor and began vomiting. It was not uncommon to see crew in colonists' country, but they tended to do their drinking among themselves. It was the first time I could ever recall seeing any officer drunk, and I realized that must have been a policy of Captain Bean's. Which nobody gave a damn about anymore.

In Rup-Tooey I found Herb, Pat, and Solomon, sitting around and bullshitting like students after curfew, though it was midafternoon. The moment I laid eyes on Solomon, it came into my mind that none of us went probably ever going to be able to bear to call him by anything but his full first name, ever again. Or at least for years to come.

He looked up and nodded as I came in. "Hey, Joel. How are you feeling?"

"Swell," I said. "You okay, Herb?"

"No," he said, with no more affect than if I'd asked him if he were lefthanded.

"You going to be?"

"Yes," he said the same way.

I believed him both times. We nodded at each other. I wanted to put my hand on his shoulder, but knew he would hate it. It can be frustrating to care about people who hate to be touched, sometimes.

Solomon said, "I was such a big help the first time you woke up, I thought this time I'd leave you alone."

I put a hand on his shoulder, and squeezed. He reached up and squeezed my hand back.

"You want coffee?" Pat asked. "Or ethanol?"

"Yes."

Herb nodded, got up, and made me an Irish coffee. I pulled my desk chair over to join the group and sat. "Somebody bring me up-to-date on what's happened while I was out. Do we know anything, yet?"

"Everyone in the Solar System is dead," Herb said over his shoulder. "All other information follows at lightspeed. Sorry."

I wished I had asked anything else. "We're sure it wasn't just Ter—"

"Gene's twin sister Terry was behind Jupiter. She had time to know what she was seeing. Poor woman. The times match. Doom arrived from Solward at lightspeed. QED."

I'd forgotten I had already worked that out, back in the autodoc. Another ill-considered question, in any event.

Solomon said, "The specks of data we do have indicate that conversion of Sol's mass to energy was at least ninety percent efficient, and could have been perfect."

If there is an intelligent response to that statement, none of us found it.

"Is there a consensus guess what went wrong, even?" I tried finally.

The smell of fresh coffee filled the room.

Solomon snorted. "First, we have to settle how many angels can dance their way into a pinhead."

"Solomon—" Pat began.

Herb said, "He's saying it's a religious question."

Pat looked scandalized.

"Exactly," Solomon agreed. "Everybody is going to end up with a firm opinion, based on intuition, but nobody's going to be able to defend his. The first scraps of actual hard data aren't going to catch us for years to come. And I doubt they'll settle anything. I don't think the question will be answerable in my lifetime. Except on faith."

"I just hate to even use the word 'religion' in this context," Pat said. "It makes my skin crawl."

"Occam's Razor," Herb said, bringing me my Irish coffee. He'd made one for himself as well.

"What?" Pat asked.

"We forgot Occam's Razor," Herb said.

"I don't follow." I could see that Solomon did.

Herb sat and drank some of his coffee. "The sky has always been full of things we can't explain," he said. "It still is. Anomalies always abound. Gamma ray bursts. Missing matter. Quasars. Dozens of things. Generations of astrophysicists have made careers creating different, complicated explanations for each of them—often brilliantly. But one explanation for *all* of them, a quite likely one, they have never once considered. Or at least, anyone who did propose it instantly lost all credibility"

"Oh, Herb, no!"

He nodded. "Intelligent design."

Pat tried to speak, but could only sputter.

"That's exactly why, too," Herb said. "For some reason, we let the god-botherers appropriate that term as a euphemism for their stupid deities, and let our revulsion for the latter cloud our understanding of the former."

Solomon spoke up. "He's right, Pat. Once you get over the baseless idea that an intelligent designer must necessarily be God, it gets easier to deal with. Nothing whatsoever except a lot of dead fools says an intelligent designer has to be omnipotent—just more powerful than us. He need not necessarily be omniscient—just smarter than us."

Herb said, "And God Himself knows there is no reason why an intelligent designer must—or even can—be ornnibenevolent. He need not even be as *nice as* us. And we're swine with starships."

Pat's mouth hung open. Perhaps mine did, too.

"And finally," Solomon said, "nothing says there has to be only one —or even some low prime number."

"We found sentient life on Mars and Venus," Herb said. "But nothing at all outside the System. And the Martians and Venerian dragons were just so . . . irrelevant to us, it was easy to stop thinking about them. Even after we got bright enough to go out and look for ourselves, more than a dozen times in a row we found whole star systems containing nothing more complicated than a cat. For some reason, we concluded our star system must be unique. We got the notion we were the only sentients in the Galaxy. We should have seen how preposterous that was, and looked for more reasonable explanations."

"I really really really hate this," Pat told him.

"Exactly our problem. Hate does not add clarity."

I felt a powerful inexplicable impulse to put some music on. It would make us all feel better. I summoned up my library on my desk display and was going to choose one of my favorite old jazz records, a Charlie Haden/Gonzalo Rubalcaba collaboration that had never failed to soothe me when I needed it. But before I could start it, the album title sunk in. It was called *La Tierra del Sol.*

And every song on it had been written by a dead man, to whom it was a posthumous tribute.

I cleared the screen. So much for the power of music. I had thousands of other albums available, but suddenly I didn't want to hear any music by dead men. I wondered if the next time I picked up my horn, any sound would come out.

"Why *can't* it have been a natural occurrence?" Pat was saying. "It seems to me *that* would be Occam's Razor. Occam's Razor says don't multiply entities unnecessarily. Which is less likely? One single cosmic event we can't explain yet? Or a galaxy full of lethal monsters, hiding perfectly, explaining dozens of astrophysical mysteries at once?"

"What does Matty say?" I asked.

The silence told me I was still asking bad questions.

"Aw, shit—"

"Don't be mad at him, Joel," Solomon said. "He spent every minute of the last six and a half years praying to a God I happen to know he didn't even believe in that he was wrong, that nothing was wrong with the sun. But he knew he wasn't; that's why he came apart. The measurements he lucked onto as we were leaving told him something unprecedented and scary was going on. He was too good at what he did to be wrong. Having it confirmed was just too much."

He was right: Matty had hinted about this to me, more than once. Something about a perfect solar eclipse by Terra occurring as we'd left the System, and something wrong about the predicted displacement of some stars behind Sol. Whatever had happened—or been done—to our star had taken six or more years to finish happening. The few subtle signs had been visible only to someone outside the System. One day, our descendants might find that a useful clue. If we had any.

Oh, no wonder Matty had gone to pieces.

Not that he could conceivably have done anything to prevent the tragedy. With no one else in a position to replicate his data—until whenever the next starship containing a good astronomer was built and launched to a point where it happened to see a perfect solar eclipse from the right distance—he could not possibly have gotten anyone to listen to him in time to do the slightest good. At most, he might have created a disastrous Systemwide panic.

"He probably had more people he cared strongly about back in the System than anybody else aboard," Pat said. "Except maybe Dr. Amy. No, no, she's all right," he added hastily, seeing my expression. "But she's hurting."

I closed my eyes for a moment. Might as well get it over with. "Who else that I know is gone?"

Another awkward pause. I should probably never ask another question again.

Solomon answered. "Balvovatz, for one."

"What?" I was stunned. One of the last people I'd have guessed would ever suicide was Balvovatz, that cynical, fun-loving old Loonie.

But then as I heard that last word in my mind, I started to understand. His tragedy was, impossibly, even greater than that of most of the rest of us. Everyone he cared about back in the System lived—had lived—in Luna. It was the preposition killing him.

All the other planets mankind had used, it had lived on the surface of. Even the Marsmen had been aboveground for over a century now. Only Luna was too small to terranize. Loonies had still lived almost exclusively underground. Some of them quite deep.

By now, if there were any solids at all among the particles expanding from the place where the System had been, they would probably be on a pair of smelted lumps formerly known as Jupiter and Saturn. Even they might not still exist, if the destruction had been as complete as Solomon believed.

But some Loonies might conceivably have lasted whole seconds broiling in lava, before it became too hot for even lava to exist.

"Everyone you or I knew back home is surely dead," Herb said. "So is everyone Balvovatz knew. But his were among those who suffered worst."

I rejected the image, and the thought. I knew I was going to miss Balvovatz badly. I had liked him a lot. Loved him. "Okay. You said 'for one . . .' Who else is gone?"

"Diane," Herb said. "And Mariko."

Mariko Stupple was the girl I'd used for consolation for a few weeks after Diane Levy had taken my virginity, glanced at it, and returned it. I wondered how close Diane had come to achieving her goal of sampling every male aboard. I found that I hoped she had. "Anyone else?"

"Nobody else you know well, I think," Pat said.

"None of your lot, Solomon? Not even Kindred?"

"None of us has the luxury of that option," Solomon said dully.

"I don't follow."

"We have no way of knowing exactly what happened to Sol—so we must assume worst case: total destruction."

It took a second or two to hit me. If all or nearly all the mass of the sun had been converted to energy, a wave of lethal gamma rays was even now racing after us. Faster than we were going, or could go ...

I said, "Sorry, Sollie. I am not doing at all well on thinking things through, today"

He nodded. "Happens to me, too, every time I've been dead."

If even one Relativist became incapacitated, sooner or later the ramjet was going to go out and stay out. The *Sheffield* would never make port. She could remain self-sustaining for a maximum of three or four generations—but that didn't matter, because we wouldn't have anywhere near that long to live. We were only traveling at 0.976 *c* ... and death was chasing us at *c*.

"Will we be able to outrun it, do you think? By the time the wavefront catches up, will it still be—are we dead?"

Herb gave me a baleful look. "How long is a piece of rope?"

"He's right," Solomon said. "Tell me exactly what happened to the sun, what percentage of its mass was converted to what forms of energy in what proportion by the explosion, and perhaps a horseback guess could be made, by somebody as smart as Matty was. But we know hardly anything beyond the bare fact of humanity's annihilation. It could easily have been a violent enough event to fry us even as far away as Bravo. Indications are it was. We may be as dead as those poor bastards in Luna—just on a longer string."

"Jesus Christ!" Pat said, at the same time I said, "Covenant!" in the same tone of voice. I'd never heard him say that before, and took it as a clue to why discussion of religion upset him. Diehard closet Old Christians in the family might even help explain what a man like him was doing on a voyage to nowhere in the first place.

"If the explosion *was* that powerful," Herb said, "we'll never reach Immega, will we? At no time will we exceed the speed of light, and the wavefront is only six years and change behind us—"

"Ten years and change," Solomon corrected. "We've been *traveling* for 6.41 years. But we passed half the speed of light in the first year, and by now we're making more than ninety-seven percent of it. Lorenz

time contraction. It adds up."

"So will it catch us along the way, or not? I can't believe it's taken me this long to think of the question." I'd always prided myself on being quick on the uptake . . . but I decided to give myself a pass, this time.

Solomon shrugged. "I can't believe I don't have the exact answer ready for you. Al Mulherin's been crunching away at it, but I haven't checked since yesterday. We've all been thinking of other things than survival, that's all. Give me a second." He began tapping on a keyboard.

I tried to work it out roughly in my head. The *Sheffield* and waves of evil start out just under ten and a half lightyears apart, then race. Us at a very high fraction of *c* which will get even higher, but will never reach one. Them at *c*. At what point will the second train catch the first? It seemed like a classic grade school math puzzle. But relativistic factor kept royally screwing up my calculations. And then I realized I'd forgotten to factor in deceleration . . . I gave up and waited for Solomon. I knew my father would have closed his eyes for a moment and just known the answer.

"I think we're all right," Solomon said finally "As long as the ramjet keeps ramming. We expect to reach Bravo after twenty years, our time, 90.4 years in Sol time." He winced slightly as the phrase left his lips, but kept going. "Assuming a lethal concentration of gamma rays is in fact after us, it will arrive at our neighborhood about seven and a half years later. With luck, we can get dug in deep enough to weather it out in time."

Herb stood up to his full height and clapped his hands together, loud enough to make all of us flinch. "Well, that is just the best fucking news in the fucking Galaxy," he said loudly. "That makes my fucking day."

He spun on his heel and went to get the Irish whiskey. Solomon and I exchanged a nervous glance. If Herb were to go berserk in this enclosed space we would have a serious problem. He turned around and caught us at it, and his booming laughter was as loud and almost as startling as his handclap had been.

"You dopes, I'm serious! The distance between one and infinity is *nothing* compared to the distance between zero and one."

I decided to assume he was not cracking up. "What do you mean, Herb?"

"Think it through. There's one and only one reason we know, for sure, what's happened behind us. Chance dictated that two of our three telepaths in the System were in blast shadow. For my sister, Hell didn't arrive at lightspeed, but at something closer to the speed of Terra's rotation. She had time—barely—to hear and comprehend what was coming at her."

Get him off this subject. "Okay. I don't take your point."

"How many other colonies do you think *were that lucky?"*

Oof.

"Prophet's *prick!"* Pat said. "I never even thought—"

"Telepath pairs were even scarcer on the ground in the early days," Herb said. "Most of the earlier colonies made do with two. And most of those that shipped three are down to two, now Li kept up on such things."

"We've got to send a laser!" Pat cried, and started to get up.

Solomon caught his shoulder and pulled him back down. "Calm down, son. Captain Bean has already long-since notified the only colony we can help."

"But there are—" He frowned. "Oh. Oh. Shit."

Any laser or radio message we sent would travel at lightspeed. Only one human colony happened to even lie in the constellation of Bootes: 44 Boo, from which our destination had been discovered. Taking into account the offset (it was not *dead* ahead), it was something like thirty-five years ahead of us by laser . . . and doom would arrive there in forty-one years. That was the one and only colony we could possibly hope to warn, and we could give them an absolute maximum of six years in which to prepare. That had already been done.

Any other colony lacking a telepath whose partner had chanced to be in apposition at the moment of explosion, and thus needing us to warn it, was screwed. Hellfire was coming for them at the speed of light, and we were powerless to alert them in time.

Between us, the *Sheffield* and 44 Bootes probably now held the very last surviving fragments of the human race. All the rest would probably be gone within sixtyfive years.

We *had* to get to Bravo. We had to survive. It was far more than just our own lives at stake, now. It was our species. We were The Last Of The Solarians.

I remembered a spiritual book Dr. Amy had had me read the year before, by a man named Gaskin. I had been easy to persuade because the farmer in me had resonated to its title, *This Season's People.* It turned out to derive from a famous saying of the Jewish mystic Shlomo Carlebach:

We are this season's people.
We are all the people there are, this *season.*
If we blow it, it's blown.

I was the guy who had been trying to run away from all responsibility. And found just that.

I often wish I could believe in a deity, so I could compliment Him or Her on His or Her sense of humor. And then go for His or Her throat.

How long, Sol?" Herb asked.

Solomon winced to hear his own name. "How long what?"

"Blue sky it with me, here. Optimistic assumptions throughout. I just want to get a vague sense of how far away the payoff is."

"I'm still not understanding you."

"Assume all goes as well as we can reasonably hope, from here on in. The folks at 44 Boo dig in successfully, and survive with zero fatalities. We make it to Bravo, dig in successfully, and also survive with no further fatalities. Round our numbers off to five hundred for convenience, and assume 44 Boo has twice that population by this point."

Sol nodded. "All right."

"The human race now numbers fifteen hundred, total, plus an indeterminate number of frozen ova. It's in two pieces, forty-odd lightyears apart, with no telepathic links. That's our starting gene pool and situation. We have specs for virtually every piece of proven technology the System had when we left, 44 Boo nearly the same, and we'll both get better and better at making our own parts, so again let's simplify, and just say we'll be able to build new relativistic ships again in a single generation."

Sol was dubious. "That's a damn big simplification."

"On the time scale I'm talking about, it'll disappear in the noise," Herb insisted.

"Go on."

"Here's what I want to know, and I'll settle for a very rough approximation: how many centuries will it be, do you suppose, before we have rebuilt and protected our civilization sufficiently so that we can *track down those shit-sucking back-shooting baby-burning vermin and blow up THEIR fucking star?"*

His voice rang in the silence that followed. Standing there tall with a fifth of whiskey in his hand and death in his eyes, he had never looked more like a Viking chieftain.

"How many generations?" Herb continued. "A lot, I know—but roughly how many, do you suppose? How far away were we ourselves from having the power to make stars go nova?"

"I repeat," Sol began, "I really think we should be careful not—"

"You're right, sorry," Herb conceded impatiently "A nova is a natural phenomenon, and we know this probably was not. G2s don't nova. That is a point worth remembering. So: how far away were we from being able to make stars go boom? How far do you suppose we are *now* from being bright enough to reverse-engineer it, once we start getting some hard data on exactly what was done?"

"It won't even start to happen in our lifetimes," Solomon said.

"I know that. I'm not talking about me. I'm talking about the human race. It numbers fifteen hundred people, and it has only two tasks. Hide. And hit back. I'd like to try and get a loose sense of how many centuries it's going to be before there's likely to be any good news again. My intuitive feeling is, on the order of five hundred years. What's your guess?"

The idea was breathtaking, heartbreaking. I had vaguely understood that a very long, very hard task lay ahead of me. Until now I had not grasped that it probably lay ahead of my remotest descendants.

Nobody had an answer for him.

I stood up and went to him. "Unhand that bottle." He passed it over, and I topped up my Irish coffee, which had been down to its last inch, tried it, and it seemed the right concentration for the moment.

"Damn it," Pat said. "Damn it to all hells at once. *We* managed to evolve beyond war. Why couldn't *they?"* He shook his fist angrily in the general direction of the hull, and the stars beyond it.

"We didn't evolve beyond war," Herb said. "Just beyond violence—and we've only been free of that for a whole whopping century and a half. You still know how to shake your fist. There was a trade war going on back in the System last week, remember? The first. Who knows how far it might have gone?"

"Even if that's true, we were getting *better,"* Pat cried. "Are we really going to have to go back to thinking and acting like the Prophets, and the crazy Terrorist nuts and Cold War nuts before *them?* Just when we were finally starting to grow up?"

There was a truly depressing thought.

I remembered Solomon's dichotomy of the Thrilled and the Threatened. Was the human race really going to have to spend the next half a millennium or more being as conservative, as paranoid, as utterly pragmatic and cynical and ruthless as Genghis Khan, or Conrad of Conrad?

What is thrilling—if entities that can burst a sun want you dead? Anything besides simple survival itself?

Would any human above the age of six ever again look up at the stars in the night sky in simple wonder?

For that alone, I wanted revenge. Never mind billions of unearned deaths by fire.

I went to the Star Chamber, alone. I couldn't talk any of the others into coming along. Solomon nagged me into taking a sandwich along. Autodocs feed you well but do not fill the stomach, he pointed out. I had to admit that something to soak up all the Irish coffee did seem like a good idea.

The Star Chamber might seem like a pointless waste of cubic, but few aboard the *Sheffield* ever thought so. Sure, the Sim illusion you get with naked eyeballs in that huge spherical room is nowhere near as convincing as what you can get while wearing the rig. How could it be? And there's only the single illusion.

But you can *share* it.

In conventional Sim, in a tiny cubicle, wearing all the gear, you can have people around you, totally convincing ones . . . but you never really forget they're not real. And only partly because the smells are never better than close.

But in the Star Chamber, you could look at the stars in the company of other human beings. Just then, I could not have borne to look at them by myself.

As I'd expected, it was just as heavily in use as the rest of the Sim Suite. I had to wait awhile for a space to become available. An argument was going on behind me as I reached the head of the line. "I *know* G2s can't go nova, I never *said* it was a nova," someone kept repeating. "What I *said* was, and is, there could be some equally natural process, *other* than the nova mechanism, by which a star can explode. *Obviously* it would be an exceedingly rare event, I'm not a *fool—"*

It was only when a bystander interrupted, "You play one brilliantly, Citizen," that I realized the speaker was Robin. My oldest living girlfriend. "We all took your point the first three times you made it," he went on. "And I imagine my great-grandchildren will be both the first to know whether you're right or not . . . and the first to *give* a damn. But right now, and until the day they're born, could you possibly shut up?"

Some atavistic hindbrain mechanism caused me to consider intervening on her behalf. But I did much prefer the silence the stranger had produced.

Five minutes later it was broken—from inside the Chamber.

At first, all I could tell was that someone was yelling in there, very loud. But as they got him closer to the outer door, his tone and then his words became audible. I don't think it took any of us on line more than half a second to understand. He was screaming at the top of his lungs, with berserker rage. At the stars.

—shit-eating piss-drinking pig-fucking goat-sucking maggot-licking baby-raping *well-poisoning* illegitimate spawn of degenerate diseased vermin-vomit"—he was shrieking as they forced him out into the corridor—"I'll pop your mutant eyeballs with your own—" and at that point Proctor DeMann came trotting past me, touched him gently near the base of the neck, and caught him as he fell. He stood there with the man in his arms, his breathing as slow and measured as if he'd been standing in line with me, and gestured with his chin.

"Next!" he said.

I nodded to him, stepped into the lightlock, waited for the outer door to iris shut, then opened the inner one and entered the Chamber, almost on the heels of the two people who'd ejected the screamer. I stopped and waited for my eyes to adjust, and for the self-appointed bouncers to resume their seats so I could tell which was the empty one. The experience of the room came on like a powerful drug rush.

There was nothing to the Star Chamber, in one sense. A spherical room that was cut into upper and lower hemispheres by a floor filled with sling couches—but seemed not to be because the floor and couch frames were transparent. That was basically it. Until it was powered up.

But then one of the *Sheffield's* countless servers caused the walls to display the universe.

Not perfectly, as I said. But well enough to fool the subconscious. And the heart.

Not the unrecognizable mess we would have seen out of portholes, if there had been such silly things—but a corrected image, which removed the eye-wrenching distortions and displacements of relativistic Doppler effect. The universe as it actually was out there right now, for anybody who was not racing photons. As we would see it if somehow it were magically possible to instantly shed all our hideous inertia and decelerate to sublight velocity for a few moments. Well, obviously not as it was right now; there had to be some lag, and some assumptions made. But close.

It was quiet and still in there, now that the sufferer had been removed. By the time my pupils had finished adjusting, I saw that the room had been reprogrammed as I had expected it would be. Known it would be.

When humans sit together to look at the stars, they look up. It's way older than rational thought, possibly older than thought. So the Star Chamber was customarily programmed to place whatever part of the universe the Chamber's inhabitants found most interesting directly overhead. Most of the time, though by no means always, that had meant Immega 714 could be found at galactic high noon.

Today, Peekaboo was directly under our feet, and we were all looking at where Sol had been.

As I had expected, someone had explained to the computer that it could delete Sol from its permanents, now. To have seen it there still blazing in the sky would have been unendurable. I had vaguely wondered if they would attempt some graphic representation of the explosion, but of course they had had better sense. To watch that happening forever in slow motion would have been equally unendurable.

What was there was endurable—but only just. Only just barely. It was shocking, and ... neither "pitiful" nor "humbling" even come *close* to touching it, but those are the two closest words I can find. It didn't matter in the *slightest* that I had fully expected it, that I understood it intellectually and had for all my adult life, that it was old news.

It was simply heartbreaking, mind-numbing, soul-chilling, to see, with my own eyes, what an incredibly tiny, insignificant hole the removal of Sol left in the fabric of the Galaxy.

If I had not known exactly where to look, and been thoroughly familiar with that particular degree of the sky I'd have missed it. Anyone would have.

As I stared, mesmerized, it came to me for no reason at all that the very first cinematic work to take starflight seriously had been titled *Star Wars*. The irony was mind-melting.

I thought I felt a great disturbance in The Force—as if millions of voices had cried out as one, and then were silent.

Millions, you say? Hell, son, suck it up and walk it off! For a second there, I thought you had a *problem.*

Try forty-seven billion.

That was why I had come here, I realized. I'd had to see it with my own eyes. Among other things, I needed to put my brain more in synch with my mind.

My mind understood all about the universe and its correct scale and mankind's terrible insignificance in it—intellectually. It always had. But my brain had always seen things differently. To it, the Solar System was practically everything there was, and tiny hypothetical little Brasil Novo was the rest, and in between the two lay nothing but a gap in the map—one *wildly* out of scale. Like a Mercator projection of a globe, it was a false representation of reality that was much more useful than the truth.

Until now.

For humanity, the whole universe right at this moment consisted of nineteen tiny colonies, at least two of them believed to be slowly dying, many of the rest doomed. All of them many many lightyears distant from one another, communicating by laser or radio. Even if any of them should survive this, it would take us many decades, maybe centuries, merely to finish hearing what each of them would have to say about this shared catastrophe, when they found out, and as long again after that before we could possibly hope to hear a word of response from anyone to anything we might say.

To my personal brain, the whole universe now consisted of the *Sheffield,* and emptiness. Bravo was a fantasy.

To my mind, the whole universe consisted of Bravo. The *Sheffield* was now just an antechamber, with a timelock on the door.

But my eyes kept reminding me that neither was true. It was good to be reminded.

Because sitting in a chair spoils the illusion somewhat, the Star Chamber restores it and reinforces it by always *drifting* slightly, while keeping the focal star overhead. It works quite well. The universe as it actually is blazed all around me, and I floated in it, so convincingly I felt the first faint symptoms of psychosomatic dropsickness.

But it no longer held the beauty, the majesty, the grandeur, the glory that it had always held for me before.

For no reason I could name, my mind leaped back more than six years to the night of my prom. Jinny and I orbiting each other like halves of a binary star. Someone singing, "*It would not be so lonely to die if I knew/I had died on the way to the stars—*"

In my brain, I was no longer on my way to the stars. I was on my way *from* them, to refuge.

With more than twice the distance I had already covered still to go.

I felt and heard my own left foot start tapping spastically on the deck. I needed my hand to make it stop. For some reason that made me want to cry.

Someone ahead of me and to my left stood up and cleared his throat. There was a rumble of annoyance, and a woman behind me muttered, "Whatever it is, keep it to yourself."

But then he said, "I apologize for disturbing your *wa,"* and there was general relaxation as his voice was recognized. Tenzin Hideo Itokawa was well liked, even by those few who had problems with Buddhism—possibly in part because in over six years I had not heard him use the word once. He was also one of the gentlest and kindest souls aboard, and what he did best of all was listen. You make remarkably few enemies that way. And finally, of course, everybody knew that he kept the most popular man aboard, his partner Solomon Short, extremely happy. And not just because Sol kept mentioning it.

I'm not sure anyone else could have said what he was about to say, and finished saying it, before being hounded out of the room. So it's good it was him.

People face in any direction they like in the Star Chamber, but now nearly all of us turned our seats around to face Hideo, near the center of the room.

"I wish to tell you all something," he said, when stillness returned. As always, he spoke slightly slower than another would have, and slightly softer. It made you listen closer, and think more about what you heard. "I need to tell you. You need to hear me. But it will be hard to hear. *Shikataga-nai.* It cannot be helped. For this, too, I apologize to you."

"You go on and say whatever you got to, Hideo-san honey," said the woman behind me.

He bowed to her. "Thank you, Mary."

His next seven words were spoken the slowest yet. Two slow pairs and a slow triplet, with pauses two or three full seconds long between them. Maximum emphasis and earnestness.

"The time . . . for fear . . . is *past,* now."

Everybody spoke at once. Not all were angry, but everybody spoke at once. Have you been in an enclosed hemisphere when everybody spoke at once—a dome, perhaps? People far away sound louder than the ones beside you. It's so weird, silence usually resumes quickly, and it did now. Then two or three tried to speak at once, and none would yield, so someone told them to all shut the fuck up, and the noise level started to go right back up again—

"PLEASE!" the loudest voice I had ever heard bellowed.

Instant silence.

Even when I was sure, it was hard to believe that much sound had come out of quiet little Hideo. He took his time replacing the air it had cost, in a long slow perfectly controlled inhalation. It was a good example. I began measuring my own breath.

"I promise I will hear what each of you wants to say," he said. "Until you are done speaking. Please wait until I am done speaking first. It may he that my meaning will require more than a single sentence to fully express."

He had the floor back.

"Some of you might become angry if I said Sol may have died of natural causes, so I will not say that. We all know that is theoretically possible, if most unlikely. But it is unsatisfying to think about. It leaves us nothing to do but mourn our colossal bad fortune.

"I believe what happened was *done.* I believe one day we will meet those who did it. We will speak with them. And for all we can know now, perhaps we may choose to prune them from the Galaxy. If we can acquire such power."

The crowd was solidly with him again now.

Slowly, he shook his head from side to side. "But I do not believe this will happen in my lifetime, or that of the youngest infant in the *Sheffield.* I suspect it will not happen in her grandchildren's lifetime.

Everything we learned and built in ten thousand years of painful evolution was insufficient. It will take us many generations just to restore that, if we can."

Murmurings of dismay, argument.

Again his voice drew power from some unsuspected source, not as loud as his earlier roar, but enough to override the impolite.

"But of this much I am certain: we . . . will . . . *have* those generations."

Silence again.

"I have heard many of you express deep fear that our enemy might even now be hunting the *Sheffield."*

Pindrop silence.

"This is not rational. If it were true, there would be none to think it."

"They're six years behind us," a deckhand named Hildebrand yelped. "How do we know they're not hot on our trail?"

"Reason with me, Dan," Hideo said calmly. "If I build a machine that makes stars explode without warning . . . is it not certain that I must be able to reach stars other than my own? Had I but the one star, such a machine would have no sane function. Agreed?"

Hildebrand reluctantly grunted agreement.

"If I can travel the stars so easily that I develop reasons to blow some up . . . can I possibly be constrained by the cosmic speed limit humans must presently obey?"

"What? The speed of light is abso—"

"Name a method of slower-than-light travel by which you could so much as approach our general region of this galactic arm *without ever being detected by the Solar System."*

Hideo had him there. Fusion, antimatter, ramjet, all were pretty much impossible to miss.

"To have ambushed us so successfully," Hideo said, "they must be superluminal. By orders of magnitude, at the least."

He paused there. After a few seconds of thought, someone said,

"Subluminal, superluminal—what's your point, Tenzin Itokawa?"

Hideo turned his hands palm upward. *"We* travel at less than *c*. They travel at some very high multiple of *c*. Perhaps an exponential. And we have just agreed that we are clearly visible to anyone looking."

"What, they didn't notice us leaving?" said Terri, one of the Healers.

"Perhaps. Perhaps they mistook our nature. Perhaps they don't care."

"Beg pardon, Tenzin? Why wouldn't they?"

"It is hard for us to think this," Hideo said, "but the annihilation of humanity may not have been their purpose in destroying our star. For all we can know now, it might be merely collateral damage which they deemed either insignificant or acceptable. As we accept the deaths of millions of microorganisms living on our skin and in our hair each time we choose to bathe."

He had silence again. He let it stretch, while the stars drifted slowly past his head.

"There are wise ones," he said finally, "who say that man cannot endure insignificance on such a scale. That if confronted by a species as far advanced beyond him as he is beyond dogs, his spirit must inevitably break. For an example they point to the original inhabitants of the North American continent on Terra, who so thoroughly internalized a perception of their own inferiority that they became all but extinct within one or two centuries.

"Somehow they miss the counterexample of the original inhabitants of the South American continent. Or of the Africans chained and sold by other Africans to the Europeans even then conquering both Americas."

"Where are you going with this?" Hildebrand demanded. "We know we're not going to fold up and die."

When Hideo replied, his raising his volume again startled me, but not as much as his words themselves.

"I have great anger in my heart."

That made everyone sit up a little straighter.

"I do not wish to. It may help my grandchildren one day, but it is useless to me now ... here. And I do not have room for it in my heart. I need all the room for grief.

"The only way to deal with anger is to cut it at the root. The root of anger is *always* fear.

"I do not fear for the dead. It is too late. So I must be afraid for myself, and my friends here.

"There are only two things for us to fear, and I have just showed you that the first is irrational. I share it myself! Even now a tightness in my spine tries to warn me that the Star Killer could be drawing a bead on us right now, that I may not live to finish my sentence. But it is madness, not good sense. I can learn to make it go, and so can you."

As he spoke I was feeling my own shoulders start to lower, my lungs taking in deeper breaths.

"The second thing to fear is that we will fail the test. That we will not be good enough, strong enough, smart enough, to found a society which can grow to accomplish the things that must be done. Last week, the worst decision we could possibly make would have killed five hundred and twenty people, at most. Such a poor decision today would come very close to literally decimating the remaining human race. An unacceptable loss. Let me say this just right."

He paused and went inside himself. Nobody said a word. Hildebrand started to, and there was a dull thud sound, and he exhaled instead.

"Both fear and its cover identity, anger, are notorious for producing spectacularly bad decisions."

No actual words, but there were widespread grunts, murmurs, snickers, and harumphs, all of firm agreement.

"I will offer only a single example: the Terror Wars that led inexorably to the Ascension of the Prophet.

"Shortly after Captain Leslie LeCroix returned home safely from the historic first voyage to Luna, fanatical extremist Muslims from a tiny nation committed a great atrocity against a Christian superpower. Suicide terrorists managed to horribly murder thousands of innocent civilians. The grief and rage of their surviving compatriots must have been at least comparable to what we all feel now."

"Intelligently applied, that much national will and economic force could easily have eliminated every such fanatic from the globe. At that time there were probably less than a hundred that rabid, and by definition they were so profoundly stupid or deranged as to be barely functional. It was always clear their primitive atrocity had succeeded so spectacularly only by the most evil luck.

"We all know what the superpower chose to do instead. It crushed two tiny bystander nations, killing some dozens of actual terrorists, and hundreds of thousands of civilians as innocent as their own dead loved ones had been. The first time it was suggested that nation's leaders had perhaps known about the terror plot and failed to give warning. The second invasion didn't even bother with an excuse, even though that nation had been famously *hostile* to terrorists. Both nations were Muslim, as the nineteen killers had been: that was enough. The nation nearly all of them had actually *come from* remained, inexplicably, almost the only Muslim ally the Christian superpower had in that region.

"The generation of a large planetary web of enraged Muslim extremists was so inevitable it is difficult for us now to conceive of the minds that did it. They were some of the most intelligent and humane people in the history of the planet: What *could* they have been thinking?

"Of course they were not. They were feeling.

"They were a superpower, and monotheist. No one had ever hurt them remotely that badly, and they were utterly certain no one had any right to hurt them at *all*. They reverted to tribal primate behavior. Beaten and robbed of your banana by a bigger ape or a more clever chimp ... you find some smaller, stupider primate, beat him, and steal *his* banana.

"So doing, they ignited a global religious war that threatened to literally return the whole world to barbarism. The only thing to do *then* was crush it under the iron and silicon heel of a slightly smarter barbarism, a marginally less bloodstained religion, the best of all possible tyrannies. Nehemiah Scudder became the Holy Prophet of the Lord, smote the false prophets, and darkness fell."

He paused and turned slowly around in place. He seemed to be trying to meet the eyes of each of us in the dark. "If we respond to our own unendurable grief and sadness in that same way they did—by looking away from grief and sadness, and seeking comfort in fixating instead on paranoia and rage—if we react with our own version of their Terror Wars—then we will probably lose this fight, and we will probably deserve to."

That produced rumbles, and he let them happen, and waited them out. No one voice chose to try and take the floor, but many small murmured conversations were held at once.

"Let us continue on our journey," Hideo said after a while. "Let us build the new world we planned. Only its very *longest-term* goals have changed. We hoped one day to be part of a great interstellar community with a radius of ninety lightyears and a volume of three million. *That is still our goal.*

"We hoped that community would live in the peace and harmony we were just beginning to take for normal in our home System. That will not happen now. Defending that community and ending a war are new goals we've only just learned we have.

"We also hoped to communicate efficiently by telepathy through the Terran hub. That will not happen now either. And for that very reason, this war will be so lengthy that we cannot even begin ending it for thirteen more years, and will never live to see any progress whatsoever. We have the luxury of much time in which to make our decisions. Let us make smart ones from the very start.

"The smartest thing we can do is take hate from our hearts. There is nothing to *do* with it, no one to use it on but each other. Thus we must banish our fear, lest it grow cancerous tendrils around our hearts.

"When a child hits his thumb with a hammer, if he is alone, he will say to his hammer, 'Look what you have done.' If he is with another, he will say, 'Look what you made me do.'" A few parents chuckled. "When we become victims, we want to victimize. So badly that if no victim presents himself, we will settle for an inanimate object, rather than have *no one* to hate. It is nature.

"We must be wiser than that child. There are no persons here but ourselves. There are no inanimate objects here we do not need.

"Be *sad,* citizens. *Hurt.* Grieve. Go insane with grief if you must. But please . . . avoid the different insanity of rage. At the very *least,* until we locate the target that deserves it. Meanwhile, let us teach our children love and compassion for one another, as we have always done, by practicing it in our own lives for them to see. Let not this inhuman enemy have taken our humanity from us."

The applause startled him. But after a moment he sort of leaned into it, like a stiff breeze he was sailing through.

He bowed then, and headed for the door. People made way. Some touched his shoulder or arm or face as he passed, and he acknowledged each.

When he got to the door he stopped and turned. We waited for his coda.

"Many of you know I am a student of Zen," he said. "All my life I have belonged to the Rinzai sect. Long ago it was the Zen of the Samurai. Warrior Zen." He took a deep breath. "I have changed my affiliation. As of today—as of now—I am a student of Soto Zen, like Hoitsu Ikimono Roshi, who discovered the relativistic engine. Soto is the Zen of the peasants. Farmer Zen." He looked around at all of us one last time, and made a small wry smile. "As of today, it is the more useful to me. And now you must excuse me, for my shift is soon to begin." He was gone; the lightlock cycled behind him.

The silence he left behind him went on for several minutes before anyone tried to say anything, and those who did were politely asked to say it somewhere else, and after that it lasted . . . well, I don't know, but at least until *I* left, a couple of hours later.

Word of what Hideo had said spread throughout the ship. The *Sheffield* had recorded every word, and he readily granted permission for its uploading. It was more words than he had spoken in the entire voyage until then. It didn't produce any miracles. But over the next few days, it gradually started to seem possible to us all that we might heal one day. Not soon enough, surely. But one day.

We had a shot, anyway.

It seemed that way right up until four weeks after The Day, when Relativist Peter Kindred was found dead by suicide in his quarters.

He had taken massive lethal overdoses of a stimulant, a depressant, an analgesic, and a powerful entheogen, using care and a lifetime of extensive experience to time it so that they all peaked at once. I imagine he went out feeling just like the energy being depicted in Alex Grey's *Theologue,* burning with universal fire. The first witnesses on the scene described his expression as "transcendent" and "blissful," until Solomon Short arrived and caved in half his face with a looping overhand right that began and ended at the deck, blasting Kindred's corpse and the chair holding it two meters across the room, and breaking five bones in Solomon's hand. Despite the pain he must have been in, he stayed enraged long enough to find the suicide note Kindred had left, and delete it unread. By the time the proctors arrived, he was calm, docile, and dry-eyed, ready to be escorted to the Infirmary. Their relief was obvious. If he'd still been crazy enough to assault them, they'd have had to let him beat them up.

He and Hideo-san and Dugal Beader did their best for us, and managed to hold out for longer than anyone thought they could. The first time the drive went out, a week later, Hideo got it restarted in a matter of minutes. Four days after that it failed again, for the last time, on Solomon's watch.

Nothing we could possibly do would ever allow us to drop below ninety-five percent of the speed of light again, now. We were going to reach Brasil Novo at something ironically very close to the time we'd expected to—and sail right on past, too quickly to do much more than wave goodbye to our dreams.

In theory, we could then persist for another three or four useless, pointless generations. But a century after our departure from the Solar System, when we were 444 lightyears from where it had been, the gamma rays from its annihilation were going to catch up and complete the job. Sterilize the *Sheffield*.

Mankind was down to *eighteen* scattered outgrowths. And we weren't one of them.

That old song was wrong. We were *going* to die on the way to the stars . . . and it was lonelier than I had thought it would be.

Nineteen

We have learned now that we cannot regard this planet as being fenced in and a secure abiding place for man; we can never anticipate the unseen good or evil that may come upon us suddenly out of space.

—H. G. Wells

The War of the Worlds

Existence had lost all point.

For the first time ever, it was not hyperbole. It really had.

Fine. Tell that to the goats. Their existence had a point: being fed and milked. It seemed enough to them. Tell it to the rabbits. Their existence had all the purpose it would ever need: fucking. The chickens thought the point of existence is hatching eggs; the rooster held a different opinion; but both were convinced. The vegetables did not even dignify the question with an asking.

Being around that kind of naïve certainty was soothing. And I had made a deal with those critters. It did not contain an escape clause letting me off the hook in the event of solar disruption or even disappearance of local gravity. They had kept their end, so far, by living.

Also, I needed to be somewhere that was not Rup-Tooey. I had been sleeping like a baby there, lately. Alone, waking up wailing every few hours, wetting the bed. Not a good thing in free fall.

So I was on the Bravo Ag Deck. I'd thought of going up to the Horn and playing Anna for whoever was there. But I'd decided that if somehow I did succeed in blowing everything that was in my heart out the end of my sax, I might fail to inhale again. And so might my listeners.

By now I found the steamy smells of Bravo—or what we had imagined they might be like—conducive to inhaling. It would have been a terrific planet, if we could have gotten there, I remember thinking.

But of course, the smells were much less intense and local than I was used to. Now that the *Sheffield* was in free fall again, we were back on free-fall airconditioning. That translates to constant heavy airflow in any cubic where humans spent time. It has to. In zero gee, unless the air is kept very well stirred at all times, the carbon dioxide you exhale tends to form a sphere around your head and smother you.

The mood I was in, I'd almost have accepted that to have the good Bravo smells back, rich in my nose again. But of course, I never would, now.

I was wearing the Zog's treasured old Japanese gardening shirts, which he'd picked up on a trip to Terra in his youth. Tiger Kotani owned a similar one. It was a PreCollapse garment, made in prerepublican Japan in respectful imitation of an even older style, cream with turquoise trim, covered with colorful images of samurai, peasants, beautiful maidens, pagodas, mountains, and tall Noble fir trees. Just wearing it made me feel I could talk to plants, and understand their replies. In zero gee it flapped around me like wings.

I had no responsibilities at the moment. Over a dozen of us had chosen to emulate Peter Kindred—so far—but fewer than half of those had left instructions to bury them. I guess if they'd seen any point in contributing to our ecosystem, they would not have opted to leave it. Those few who had chosen the oldest form of eternal rest had long since been tucked beneath soil. Admittedly it had proven more difficult without gravity to help keep the dead moving in the desired direction. I decided to see how the goats were doing in their improvised zero-gee enclosure. I had a pretty good idea I knew what the rabbits were doing.

"Citizen Johnston," the *Sheffield* said softly "Captain Bean requires your presence on the Bridge immediately. Acknowledge, please." Requires? Of a free citizen?

I thought about how much the Captain must be in the mood for backtalk, right about now That he was still functional at all was a miracle. He had expected to carry the heaviest of responsibilities for another fourteen years. Now he had none. No further piloting was ever going to be needed.

"I'm on my way"

He's going to announce his retirement, and ask me to take his job, I thought. *Joel Johnston, Star Pilot! How old was I the first time I ever thought those words—six?*

It was the first even mildly humorous thought I could recall having in . . . some period of time. That couldn't be good, could it?

Along the way, I checked both the official news site, *Sheffield Steel,* and the barely tolerated unofficial one Jules ran despite Richie's help, *The Straight Shit.* Neither had word of anything unusual or even interesting. In fact, each had barely been updated since the day before Kindred had wasted us all. Who cared anymore if RUP-0 sector got their plumbing problem under control, or young Sparks Reilly succeeded in adding another thousand digits to pi?

I was surprised to note that one of the few headings showing new material at each source, besides obits, was the wedding announcements. The same news that had triggered fifteen suicides had also apparently inspired nineteen couples, one triad, and one quartet to get off the dime and make a commitment for the future. Since there wasn't going to be one, it seemed incredibly sad to me. What shall it profit a man if he gaineth his soul, yet he loseth the whole universe? How could you have children now?

Kathy's group, I noticed, had replaced a suicide husband with a new wife. Until then, I had not consciously realized I'd been toying with the idea of trying to get back together with her, in some way, on some basis. As soon as I did realize it, I knew it had been a bad idea—sheer loneliness, looking to get comfort without the trouble of pretending to get to know someone first. I'd already screwed up Kathy quite enough. I had come aboard this bucket of mildew loudly proclaiming my intention to die a bachelor—it was time to put my vast, useless money where my big dumb mouth was.

I had a momentary image of myself dying all alone. And suddenly I saw that the me in it was the same age I was now. Right then and there in the corridor, I became aware for the first time that if I continued as I was going, if I did not make some kind of drastic change, it might be no more than a week or two before the Zog would be planting *me.*

I would like to say I froze in my tracks, consumed with horror at this revelation, and resolved to race to Dr. Amy for help as soon as I'd finished whatever the Old Man had in mind. It did disturb me, but I didn't break stride. And I was pretty sure I'd already seen Amy's best moves.

Well, when you reach that mental state, about the only thing that can save you is for random chance or intelligent design or the Lord God of the Heavenly Host or whatever you want to call the source of all the irony in this universe to come kick you square in the ass with His almighty reinforced boot.

I got mine around the other side, that's all.

I had never seen the Bridge. Not with my own eyes, anyway. But it looked much like it did in the Sim, even to apparent size and lighting. The main visual difference I noticed as I came through the hatch was that almost none of the countless screens, dials, or readouts were active, including the main display before the Captain's Couch. In Sim, everything was active all the time, and there was a constant faint undercurrent of metallic beeps, chirps, buzzes, and other technosounds. And the Sim had the scent all wrong; instead of electrical ozone, the predominant notes were stale coffee and an odd, hauntingly redolent perfume. I would never have taken Captain Bean for a perfume kind of guy, and while I didn't know the Second Officer, van Cortlandt, his picture hadn't made him seem like one either.

One other intangible was different. Here I was somehow acutely conscious of the stupendous thickness and weight and ingenious design of all that shielding above my head, and of the fact that our speed was so horrendous, some dangerous stuff was getting through anyway. The hazard was low, but I would definitely be safer when I got back down as far as the Ag Deck or Rup-Tooey.

Terrific.

All these things registered on the subconscious level in the time it took me to complete a preliminary census. Big as it was, one big open area, the Bridge Deck was considerably more crowded than I had expected it to be.

I counted fourteen people total, began ticking them off. Because of the higher than normal airflow, all were displaying a tendency to drift away from their handholds. A slight majority were facing my way, so 1 started with them, left to right.

Governor-General Cott and Perry Jarnell, both imposing as hell in full formal attire including ceremonial swords, and drifting tall arm in arm as if they were posing for a sculptor, Jarnell grasping a chair to anchor them in the steady breeze. Solomon Short, wearing only a dirty breechclout and an expression it took me a moment to be sure was a broad grin, since he was upside down with respect to everyone else. Second Officer David van Cortlandt, tall and portly, with a flowing white walrus mustache, a receding mane of white hair, and extremely well-developed smile wrinkles—which he too was exercising. Odd. Captain Bean, wearing the kind of pepper-and-salt Vandyke beard, heavy on the pepper with slight mustache twirls, that has been the most common choice of skippers since the age of sail, was more what I'd been expecting; his expression was the one on my mental picture of Magellan, the day he realized he wasn't going to make it home. To his left, Third Officer Bruce looked madder than a wet hen, ready to peck somebody and then lay a bad egg. Completing the array on my extreme right was, to my mild surprise, Paul Hattori, in his best business attire. I'd have thought he was now even more useless than the crew—whether we admitted it or not, we were now a de facto social collective, operating on the barter system, with no further use for money as long as the toilet paper held out. Yet his expression was the oddest of all; he looked . . . exalted, like someone in church, or a groupie backstage. He was gripping the back of a chair with both hands in such a way as to make it seem he was standing on the deck.

Those facing away from me took several seconds longer to identify.

I got no instant-recognition hits from size or body language, nor from clothes—in fact, there was something subtly not right about their clothes I was too busy to analyze. The seven of them broke down into two het couples and three singletons, two female, one male. Something about placement and stance gave me the idea the taller of the single fems might have deliberately interposed herself between the other two, but I couldn't be sure. Without exception, they all seemed to carry themselves with an air of enormous confidence, as if they were used to being listened to respectfully.

Nobody had noticed me enter. I hadn't identified any of the ones facing away yet, and some instinct or insecurity made me keep my hand hold just inside the door until I had. So I went with my strengths. Four people were talking at once and none would yield; probably anybody else would have called the result noise. I chose to treat it as a quartet—and used my composer's ear to pick out the individual horns by their timbre and range rather than the mangled notes. Whatever they were saying could be repeated to me later; now I wanted to know who was saying them. The enhanced free-fall airflow worked for me, now, bringing me their voices with unusual clarity.

Three of the instruments I knew at once, would have even if I could not have seen them being played: Captain Bean, Jarnell, and Lieutenant Bruce, working as a trio, alto, trombone, and trumpet. That fourth horn doing the counterpoint, the baritone—

Damn, it was strange. It teased at the edges of memory. Long-term storage. Whoever he was, I'd met him briefly years ago, probably shortly after we'd left, and hadn't encountered him since. I hadn't liked him much for some reason. The penny resolutely refused to drop farther.

Another voice entered, causing the others to fall silent. A clarinet, but with the quiet authority of Goodman. This one I was sure I didn't know; its timbre was so unique I knew if I'd ever heard him speak I'd have tried to get him to sing for me. His couple-partner remained silent, contributing no harmonies.

He stated a brief theme. Captain Bean picked it up and restated it three times, changing it slightly each time. The third time, the clarinet joined in in unison, to tell him he had it right.

Lieutenant Bruce began a counterstatement, but had traded his trumpet for a kazoo; in compensation he blew so hard it broke.

The baritone entered again, but allowed itself to be interrupted by a cello in its lower register. I didn't know this voice either, I was sure of it. And I didn't much care for it. It had an undertone of menace, of unstated threat.

My strangeness meter was beginning to max. In a small town of less than five hundred, there can be one or two people you've just never chanced to run into. But three of them, that you're sure you've never even passed within earshot of? I had to be mistaken.

Captain Bean's alto reply started out softly, but built to a small angry crescendo, like the first harbinger of trouble ahead in Wagner.

The next voice, the tall singleton female, I knew at once, and started to relax. Her name would come to me in a second. I hadn't seen her in years, but had always liked her. This one was no horn, but a singer: smokey voice, like late period Annie Ross. Some sort of joke in her name. Miss Steak? Miss Fortune? Ms. Rhee? Something literary about the joke. Miss Elenius? An adolescent erotic undertone too, somehow. Something dirty . . . female honorific . . . last name that made it all a quote or literary reference . . . I was almost there . . . famous character? Title? Title. That felt right.

Oh, for Pete's sake, of course. *Les Miserables.* "Lay Ms. Robb." Dorothy Robb, sweet old lady, had been kind to me the last time we met. What was that funny job title of hers? Chief Enabler, that was it. . . .

Chief Enabler for Conrad of Conrad.

Given that context, I recognized the baritone at once. "Smithers." Alex Rennick, Master of the North Keep.

Well, *hell.* That was annoying. Clearly my wiring was misfiring. Not that I blamed it, given the events of recent weeks. But I could not even override it—no matter how hard I assured my ears that they were mistaken, they both stubbornly insisted we were all hearing Dorothy Robb together. Slightly older, perhaps, but her.

All right, this did not necessarily mean I was losing it. People can have vocal doubles. I'd have remembered a colonist in her nineties, but it was not impossible this woman was imitating one for some—

Once while colossally drunk, Herb had spoken of himself as "hanging by my fingertips from my own anus, to keep from falling out." I was in that mindset, clutching for dear life.

Then from the couple with the cello female came the unforgettable, unmistakable, inarguable, utterly impossible voice of Conrad of Conrad, and I lost my grip.

But I was in zero gravity. I didn't *go* anywhere.

Naturally I felt instant fear. But not terror.

When the impossible happens—when a planet *moves* beneath your feet, and won't stop—when you look up on a gorgeous morning and see something huge fly majestically into the side of a tall building—when a man you buried shows up at your door with a six-pack—you're supposed to feel a primal terror, a superstitious dread. It's in all the books. You pass out, or vomit, or your bowels and bladder void, or you howl. If the universe is prepared to *cheat,* you're screwed, right?

The only alternative is to decide it's all a bad dream or sustained hallucination and just go with it.

I didn't any of those things. I can't say why not. Maybe I was simply too far gone. I'd been electroshocked so many times, they no lunge' had a voltage that would put me into convulsions. In a twisted way, it was almost starting to get good to me.

The fabric of the universe itself was coming apart? Fine—bring it. Fucking thing hadn't turned out that well anyway. The dead were rising, Time itself flowing back up over the dam? Great. Gee, if I unaged slower than normal because I was on a nearly luminal starship, I might finally get to meet my mom. Go on, disintegrating reality, give me your best shot.

It is *never* a good idea to say that.

It seemed perfectly clear to me that I had fried my operating system. Deep down, I knew I had. I did *not* believe in ghosts, never had . . . well, not since I was real little. No more did I actually believe in universes that cheated. Given the insistent evidence of my senses, I knew I was nuts—the kind of nuts hardly anyone ever went anymore. There seemed only one sensible response to that.

I roared with laughter.

In a timeless instant, I saw my life as a whole, saw the shape of it, and the flavor of it, saw that it led inexorably from hope and great promise to gibbering madness in a doomed can full of tragedies ten lightyears from the hole where the human race used to be, haunted by the ridiculous shade of the evil old bastard who'd forced me onto this donkey ride to heaven in the first place—all because some nameless unknowable alien vigilante other had concluded that mankind was not a feature but a bug in the Galaxy—and there just wasn't anything else to do, not to do *about* it, but just to *do,* except to laugh my ass off. Part of me was aware the Captain had wanted my participation in an important meeting—but since he wasn't going to get it anyway, why not disrupt the silly thing? I didn't even try to hold back; I laughed like a buffalo, like a bull ape, like a brontosaur—they might all be extinct, but by God they were still funny. Naturally everyone stared at me as if I had lost my mind. I thought I had, too.

Especially when the people facing away from me started turning around.

Yep, that was Dorothy Robb, older but still as vital as I remembered. Yes, that was Smithers, his hairline strangely receded.

Yes indeedy, absolutely beyond question, the man in the center was Richard Conrad, Conrad of Conrad, and he still didn't look the part. He still looked like some sort of gruff lovable academic don, now well past retirement age but quite vigorous.

His companion was a short compact woman I had never seen in my life, and I was oddly grateful for that. At last, a hallucination with a trace of creativity! She seemed my age or a little older, remarkably fit, and as focused as a comm laser.

On Conrad's other side was another total stranger, about ten years older than me. This one was more interesting. His short stature, *pale* skin, and overdeveloped limbs told me he was a Terran. He had an overall air of sweet hayseed innocence, a gullibility based on intrinsic decency, which usually assumes itself in others. He wore a small dopey mustache like the one Jinny had once tried to get me to grow. But his eyes—his eyes had a contradictory quality I cannot express with words. I would have to show you a similar pair, and say, "Like those." I had only seen such eyes twice. My father had had them. And so had one of his best friends, whom everyone knew should *also* have won the Nobel, and who I called Uncle Max. They were the kind of eyes that caused other great geniuses to drop their egos and just stare. I wondered what his field was.

I was giving myself creative credit for having finally produced a really intriguing hallucination, when the last two people present finished turning around.

Given the mental state and emotional shape I was in right then—and the seeming theatricality with which they had both turned so slowly—I was actually fully expecting one of them to turn out to be Jinny.

I was *not* expecting *both* of them to.

The one farthest from me, standing beside the man with kaleidoscope eyes, did not *look* like Jinny as I remembered her. What she looked remarkably like, I realized, was the mental picture I had always had of "fellow orphan" Jinny's imaginary "dead mother, Mrs. Maureen Hamilton."

This one was—convincingly appeared to be—the real, actual Jinny Conrad. If she were alive, she would have been about thirteen years older than when I'd last seen her. If this was her, she had apparently lied to me about her age. Despite excellent cosmeticizing, she looked thirty-five. That too would fit.

But it was difficult to focus analytical thought on anything at all, let alone a psychotic puzzle like this, because the *other* Jinny was so much closer to the Jinny I still carried in my heart's memory that it threatened to stop my heart. Jinny at eighteen or nineteen—an honest eighteen or nineteen—so beautiful it wasn't even fair, a perfect rose just unfolding. Jinny as I had seen her then—wise and smart and compassionate and strong and certain—transported through time. Looking back at me now exactly the way she had back then, with eyes that were lamps, whose pupils were black holes, calling me to fall in.

"Hello, Joel," they both said at once.

I had begun to stop laughing when they both turned around, and finished a few seconds after they were done, with a last few "ha's."

But a split second after they both greeted me, I finally got it.

I may have been in ragged shape, an emotional basket case with a malfunctioning brain, belabored by too many impossible stimuli at once—but I had started the course with a pretty decent thinking machine. Presented with a series of clues that allowed only one rational explanation, I was bound to get there eventually. I was aware of the ancient dictum that if you're certain you've eliminated the impossible, whatever's left, however unlikely, must be the answer.

Once I got the premise, everything else made sense half a second later. I even had a pretty good idea who the two strangers were, and why they were present.

This time I laughed so hard I went into a tumble, and lost my vertical. I would have literally rolled on the floor laughing if there'd been any gravity to put me there. I had always thought it a hyperbolic expression. There was simply no position that could contain or properly brace my titanic mirth; yearning to laugh even harder, I would curl into fetal position, then explode like a starfish, then punch and kick the air the way I'd learned in Tiger's dojo, desperate to force all the laughter out before it burst me.

The moment I could spare the air, I managed to squeeze four words into the outgoing message traffic, two at a time.

First: "Hello, Evelyn."

And then: "Hello, Jin."

Two things made my father special, and only one of them was that he could think better than practically anybody else.

The other was that he could think *faster* than practically anybody else.

That means more than just getting to the answer before anyone else can. It means you reach answers no one else will. The faster you can think, the longer a logic chain you can follow out before you get tired and decide to stop. In modern physics, that can be crucial. He told me once, "The universe is so simple, it takes very complicated thought to touch it.

I inherited a touch of his freak speed. It became clear quite early that I emphatically had not inherited Dad's gift for exotic mathematics—but it was just as clear that he genuinely did not give the least sub-subatomic particle of a damn about that, and maybe that indicates genius of another, completely different kind on his part. But I had mastered the alto sax at seven, playing with a speed that had literally frightened my first teacher, Francis Layne—who himself was called

"Fast Layne." In my secret heart of hearts, I had always honestly believed I was one of the best composers alive, and one of the best saxophonists, too, although I had expected it to be decades before there was much agreement on that. Now, of course, I had it in the bag.

But I had also noticed quite early that I was usually faster on the uptake than most people. Unless the subject was me, anyway. I spent the better part of most conversations waiting for everyone else to catch up. Patterns form and combine in my mind like crystals reproducing at fast forward, sometimes so fast that even to me it seems like I skip whole steps in my logic process and just thumb to the back of the book for the answer. Telepathy is literally instantaneous; maybe sometimes other kinds of thought are, too.

I saw the people present, I knew who all but two of them were, and it seemed that the instant I got over disbelieving the evidence of my eyes, I knew who the two strangers had to be, and how all of them must have gotten here, and why each of them had come, and what their presence could mean. The actual deduction and induction itself didn't require genius, really—merely a willingness to think the unthinkable. I'd been doing that for weeks. I had most of it worked out by the time I'd stopped laughing.

Jinnia Conrad, when last seen, had been in the market for a new promising young genius-carrier.

Was there the slightest chance her grandfather would *not* have said to her, This time, find one in some serious profession. No more damned *artists*," and made it stick? Selecting a sax player had probably been as close as she'd dared come to a gesture of rebellion against her dynastic destiny, tolerated only because of my father's pedigree.

What was the exact global opposite of a sax player, if not an experimental physicist? Okay, perhaps a financier, but Jinny wasn't a *pervert.*

Assume she repeated the pattern, found the male offspring of one or maybe even two of the greatest such tinkerers in recent history, and assume that this lad had inherited the same kind of genius, the urge and ability to take the universe apart and put it back together in different ways with his own hands. He certainly had the eyes of a Tesla. And the naivete.

Propelled irresistibly by Jinny's—oh, horrid pun—by her relative-istic drive, and funded by the unlimited resources of the Conrad Family—as if J. P Morgan had been canny enough to simply find Nikola Tesla a wife who would keep him in harness—was there anything such a genius might not have accomplished?

Suppose he was interested in faster-than-light star drives? His grandfather-in-law would like that.

If he were, he would damn well have a ship equipped with one ready to test within five years, if I knew Jinny.

If he and it survived the initial tests, then the passenger list for its very first official shakedown cruise as a commissioned vessel, *long* before the rest of the Solar System was told of its existence, was absolutely and beyond question going to include at least two people besides the inventor-pilot: the pilot's wife, and her grandfather. This voyage would be not merely historic, but conceivably the most historic of all time—no possibility existed that those two names would not be in the first paragraph of the story.

They say luck is the residue of good planning. If the most paranoid man that ever lived ends up being the only one in a position to escape the end of the world with a few playmates for company . . . can you even call that luck? They must have been on the dark side of Terra, or some other large planet, when it suddenly began to glow around the edges.

If Conrad of Conrad was aboard a small vessel, a minimum of three others were, too.

First and most essential to that paranoid old villain, a very very good and very very very reliable bodyguard. She would be the one I had mistaken for a companion, the cello voice with menace in its undertones. No wonder she looked fit! She could probably fight us all with one hand, while using the other to hold a shield . . . over her employer. If you're compelled to try and screw literally everyone you'll ever meet, you need a strong condom.

Second, Rennick: pan-trained stooge, Speaker To Peasants, flapper, flunky, and designated fall guy should one ever become necessary. Don't leave the castle without one.

Third, Dorothy Robb: his walking desk, database, secretary, researcher, and necessary impertinent, licensed to sass him occasionally. She had the courage to be willing to pretend every day that she did not fear his terrible power . . . and the wisdom never to go so far that he began to suspect she really didn't.

Something about their respective positioning and zero-gee kinesthetics gave me the sudden insight that Jinny's mocking nickname for Rennick had indeed been aptly chosen. His loyalty to his boss was charged with, if not based on, suppressed eroticism. His body language said his subconscious absurdly considered even ninety-year-old Dorothy Robb a potential rival.

Given the not-terribly-surprising existence of young Gyro Gearloose—if any of them were here, he had to be—I fully understood at once the presence of Jinny, and her grandfather, and all three stooges. The one I had the most trouble explaining to myself was the person I still thought of as "little" Evelyn.

Little she no longer was—but it made little sense that she should be here. If the Conrad superluminal yacht had an extra seat, why hadn't it gone to some closer relative of Jinny's than a mere cousin? Why not one of her own parents—or if they were dead or the old man loathed them, Evelyn's?

All I knew was that her presence was the single most wonderful phenomenon in the Galaxy at that time. I was absolutely certain of that.

I've recounted this as if I examined each person there one at a time, and finished with Evelyn, because sentences can't happen all at the same time. It wasn't like that. Start to finish, she occupied a huge fraction of my attention and processing time. All the others I saw with peripheral vision—it was my day for cliches come true, and I literally could not take my eyes off her.

The resemblance to Jinny at her age was striking even given their kinship, enough to be eerie. But the *differences* were just as striking to me, now that I looked. And very dear.

This face was at least as strong as Jinny's, as determined, as proud. But it was not ruthless. Its eyes were fully as intelligent and alert—but nowhere near as calculating. It was every bit as heartstoppingly beautiful as Jinny's face had been at nineteen—and more, because it didn't care. It did not think of its own beauty as a tool, or a weapon.

For the first time I realized the imperfection in Jinny's beauty that had always escaped my notice somehow, the missing note in the perfect chord: compassion. Evelyn believed other people were real, even nonConrads. And *liked* them. Her eyes said in part that she had hurt others in her short life, and that she regretted more about that than the increased difficulty of getting them to accede to her whims.

As I was watching her, she did a little zero-gee move too complex to describe that caused her to look ridiculous for a brief moment, because if she had not, she would have bumped into Jarnell. She did it unconsciously, and I knew in a million years Jinny would never have done such a thing. Jarnell would have ended up apologizing to her.

This was a version of Jinny who could never play me the way the original had, no matter what the reasons.

As quickly as I absorbed all these things and reached all these understandings, I also saw just as clearly a couple of things that only two others present had fully realized yet, two of the most important facts in this whole equation.

Richard Conrad was not only still a very wealthy man, he was vastly wealthier than he had ever been, was now in fact without a doubt the wealthiest human being in the universe.

But his inconceivable fortune consisted of two assets.

And he only had one bodyguard.

Twenty

The butterfly counts not months but moments. And has time enough.

—Rabindranath Tagore

By the time I'd finally gotten the last of my laughter out, airflow had nudged me back within reach of the bulkhead I'd come through to enter the Bridge, and I used it to launch myself toward the meeting.

I tried to talk myself out of it all the way there. I guess I'm just not that big a man. When I reached the group, I used a deck chair to brake myself, and looked Conrad of Conrad in the eyes. For half a second.

"Hey, Connie," I said.

And turned away "Dorothy, good to see you again. Alex, I see you again. Crave pardon, ma'am, we haven't been introduced, my name is Joel Johnston." I bowed as graciously as I had free-fall skills for.

"Alice Dahl," she said crisply. That was a scary cello she was playing, all right. She did not acknowledge my bow with even a nod, or offer to shake, even with her non-gun hand. Maybe she didn't have one. She was a golem.

Jinny said, "Joel, I'd like you to meet my husband, Andrew J. Conrad. Andrew, this is Joel."

He and I exchanged about a hundred thousand words by eye traffic in three seconds, and each put out a hand at the same instant. I liked the man. The mustache looked silly, but I knew it had not been his idea.

"It is an honor to meet you, Captain Conrad," I said. "Congratulations on your historic achievements. And I speak for the moment only of the latest ones. First man to exceed c. First master of a transluminal passenger vessel. First and only man ever to match orbits with a relativistic starship in transit." I thought of another one. "And one of only seven creatures we know of who've ever been in the close vicinity of an exploding star and lived to tell about it. Welcome to our covered wagon. We hope you'll find our technology quaint."

He didn't preen, or look smug, or sneer arrogantly, or try to pretend he didn't enjoy the praise. He nodded and said, "Please call me Andrew. Thank you, Joel. I'm glad to be here."

"You're welcome, Andrew."

"Jinny told me you're a quick study. I can see she was right; you seem up to speed. We're all lucky to be here." His face clouded. "And I can't hope to tell you how much I wish I'd built the Mercury years sooner. Centuries ago. Even last year. . . ."

"We all do, son," Captain Bean said softly. "Play the cards in front of you."

Andrew nodded. "Yes, sir, that's good advice."

Van Cortlandt spoke up, his voice a pleasant tenor. "How did you ever figure out what was happening in time to run?"

"We were fortunate enough to be in Terra's shadow when she lit up."

"And you're sure destruction was complete?"

"We reached Ganymede with a thirty-three-minute lead over the wavefront, and spent five minutes talking to telepaths on the ground there. They were just receiving information consistent with the annihilation of Terra. We jumped again, and thirty minutes later telepaths on Saturn confirmed the destruction of Ganymede, with timing consistent with a solar explosion. At that point, I gave her the gun."

"Andrew's quick reactions saved us all," Jinny said proudly, and his shoulders widened.

"What can you tell us about her drive?" I asked.

Solomon spoke up. "The subject came up, as you may imagine. Captain Conrad discussed the nature of the Mercury's novel propulsion system frankly and forthrightly at some length, using short simple words, and continuing until the last of us lost the struggle to pretend we had the faintest clue what he was talking about. I myself gleaned only that its basic principle is—sometimes—called Drastic Irrelevancy. Have I got that right, Captain?"

"Drastic Irrelevancy Synergism, yes," Andrew agreed. "You see, it's . . . but then you don't. I'm sorry."

"Is there even a Sunday supplement shorthand version, albeit grossly oversimplified or crudely approximate, that you could give us?" Lieutenant van Cortlandt asked.

Andrew pursed his mouth in thought a moment. "I'm sorry," he said. "In a week, I could probably provide Relativist Short with enough tools to begin thinking about the first part of the answer you want. Uh, there are a lot of parts. Yourself, and a few others here, a month would probably do it. For sure," he amended, seeing van Cortlandt's expression.

Richard Conrad had put up with the unnatural state of being ignored for as long as he was prepared to. Ten percent louder than anyone had spoken so far, he said, "We've failed to cover this already. Can we for the love of privacy just accept for now that the Mercury is towed by a fleet of hyperphotonic swans under an enchantment, and move on?"

He was now merely a man like any other, without a multiplanet empire behind him anymore, and everyone in the room probably knew it. But he was also Conrad of Conrad, and had been all his life. We all flinched at his whip-crack interruption and fell silent, and the first one of us who felt capable of obeying him did so.

Captain Bean said to Andrew, "Captain, I have a confession to make. While I'm no mathematician, I've always thought myself capable of simple kitchen arithmetic, at least." Both his lieutenants made brief nasal sounds. "And ever since I received your hail . . . amend that: ever since I convinced myself your hail was not a hallucination, I've been using part of my mind to try and calculate what speed you were making. But there are a few more variables than I can handle, and I keep losing my decimal point. Curiosity trumps pride: Will you tell us your top speed?"

Conrad of Conrad—there were just too many Conrads present; I was going to have to start thinking of him as Richard somehow—started speaking at the same instant Andrew did, obviously trying to cut him off. I was surprised when Andrew didn't yield, then again when the old man did.

". . . not possible to answer your question, in the strictest sense," Andrew was saying, "but I'll do my best. You've traveled roughly 10.4 lights in a little over 6.41 years—your years, I mean. Thirteen years for us back home. We caught up in a little over six and a half weeks, by your clock." He sensed that he was taking too long. "But in the terms you're using, our equivalent of a maximum real-world velocity works out to be on the order of 19.6 *c."*

Several of us either sucked in air or expelled it noisily. You could almost hear a whining sound as many mental calculators began operating at full capacity.

How far away was Brasil Novo, at twenty *c?* I could make a stab at it in terms of objective years, what Andrew had called "real-world" time, but when it came to how much time it would *seem* to take for a passenger, I lacked a basis from which to even guess.

Screw that: the answer was, a *hell* of a lot closer than it had been, whether you were speaking subjectively or objectively.

And real-world years, out there in the subliminal universe, had more than academic importance, too. They were the measure of how long we had to warn the rest of the colonies, before all their skies turned to fire.

And we'd have been here nearly a day ago, if you people hadn't been silly enough to shut off your drive. We were lucky to find you at all."

Rennick's voice and ill-mannered irritation were like a cold-water bath. I saw Captain Bean, van Cortlandt, and Solomon all open their mouths to retort.

But Dorothy Robb beat them all to it. "Alex, if you actually believe anyone voluntarily shuts down a quantum ramjet, you're sillier than that would have been. None of these people have been rude to *you* yet." The hesitation between the last two words was perceptible, but so slight there isn't a punctuation mark subtle enough to render it.

Van and Solomon savored Rennick's facial expression, so it was the Skipper who spoke next. "Rennick, the *Sheffield* has had the great misfortune to lose three of her Relativists, the last just over a week ago. Heroic effort by the surviving three proved insufficient to overturn the laws of physics for more than a few days. Our drive shut itself off, sir."

"Mr. Rennick intended no offense, Captain Bean," Richard Conrad said mildly, and Rennick went from a blush to dead white.

There was a short silence, in which everyone tried to think of something to say or ask next that might not sound stupid in retrospect. It was pretty fast company; nobody was in a big hurry to be first.

I was mildly surprised at who turned out to be bold enough. It was Paul Hattori who cleared his throat and said, "I crave pardon if this question is impertinent, but curiosity overwhelms my manners. May I ask the passenger-carrying capacity of the Mercury?"

Again, that ultrasonic whining sound, as a dozen minds radically shifted direction and then reaccelerated.

Richard Conrad spoke with maximum force. "Captain Bean, I must insist we adjourn this discussion to your quarters, or a place of equal privacy, *now*. I quite understand the natural curiosity of all present, have indulged it as long as I deem prudent, and will continue to address it as time permits. But there are matters that must be discussed first only in private, and among those of the highest rank. Matters of extreme importance. There is no time to lose." When the Skipper did not answer instantly in the affirmative, he forced the issue by rotating in place and launching himself toward the hatch. "Will you be kind enough to direct me," he called over his shoulder as he floated away, and I haven't given that a question mark because he didn't.

Most of the rest of his party began to trail him out of sheer instinct, like pilot fish who go wherever the big shark goes. Captain Bean was visibly angry, but he wasn't the kind of man who would make a scene for no better reason than to establish his authority on his own ship. This party was going to follow Conrad, and the only people who considered me of the highest rank were music lovers. I felt sharp dismay.

Conrad rotated to face us again on his way to the door. "Alex, ladies," he called, "perhaps *you'd* be willing to answer any questions the rest of our hosts may have, insofar as you are able."

Jinny, Rennick, and Robb were already in transit, but all three immediately rotated themselves so they could rebound and rejoin us once they reached the hatchway. Evelyn had not yet committed herself to a launch, and stayed where she was, using a large unused monitor for a handhold. "Solomon, Van, Mr. Cott, come with me, please. Mr. Hattori, your input could prove useful as well." Bruce opened his mouth, but Captain Bean continued, "You have the con, Mister," and he closed it again. "The rest of you may remain here under Lieutenant Bruce's command until I return *if* you choose." Hattori was smiling like a musician who'd just been asked to sit in with Louis Armstrong.

The hatch irised open. Alice the bodyguard made Solomon and Andrew exit first, followed by herself, and then Conrad, with Hattori taking up the rear. She either rated the banker as zero threat or hoped he'd stop bullets.

Lieutenant Bruce began a speech. I can't recall a word of it. It was flowery, trite, pompous, smarmy, obsequious, and self-aggrandizing, all at once. Jinny endured a sentence or two, and then said, without discernible reference to anything he'd been saying, "Thank you *very* much, Commander; you are gracious."

He was so pleased he shut right up. If she understood brevet rank, then she knew what a high-ranking fellow he was—which was all he'd wished to establish to begin with. "Very kind of you, ma'am."

"Yes. The last thing I would wish, Commander, would be to distract you from your heavy responsibility. I am myself married to a pilot." I did not catch her moving any of her limbs, but suddenly she was in motion, floating slowly away from him and us. "The other ladies and I can converse with Joel over at this end of the Bridge without disturbing you, I think, if we are quiet. And Mr. Rennick will keep you excellent company; thank you, Alex."

Both Evelyn and Dorothy had started moving on the third word. I was slower off the mark, so I got to savor the expression on Bruce's face. Rennick showed no reaction, and I savored that, too. "You'll forgive me, gentlemen," I lied, then picked a docking spot and jaunted after the ladies.

It was a short jaunt, but I'd done it slowly, so I had several seconds to think on my way. When I was near I said to all three, but looking at Dorothy Robb, "Time has been extremely kind to all of you."

One corner of her mouth turned up. "I love a liar," she said. She studied my face and raised an eyebrow. "You've had less of it, but I can see you used your time well."

I nodded. "I tried," I agreed. "Jinny, it is nice to see you again. You look wonderful."

Her eyes lit with pleasure at being addressed next—age before beauty. An instant later she realized second was not the optimal position in a group of three, and the light went out.

I noted it, but was busy with the sudden realization—maybe it was more of a revelation—that what I had just said to her was strictly accurate. It was nice to see her.

And that was all it was. Yes, this woman had chased me out of the System with a crushed heart, and yes, she had haunted my days and stalked me in my dreams. But not for five years or so, now.

"Evelyn, I can't tell you how good it is to see you again. Your letters have meant a *lot* to me. I knew you would be beautiful, but apparently I have a very feeble imagination. I hope you will let me play my saxophone for you one day" It felt awkward saying all that in front of Jinny, but I didn't have any choice.

"If I can sit in on keyboards," she said.

I stared with my mouth open.

"I have a new arrangement for 'Sol Keeps Shining' I want to show you. And a couple of other tracks from *Stars."*

Can an ego have an orgasm? *Something* made my heart pound.

"Perhaps we could postpone the soundtrack until the film is done," Jinny said coldly "We do have *important* things to talk about, and little time. Grandfather doesn't have anything like the patience he used to."

"We do indeed," I said. "How many passengers *will* your husband's vessel carry?"

"Ten," she said.

"Damn." I felt sharp disappointment. I'd been hoping against hope for some vastly higher number. Twenty-one *c* was definitely an impressive velocity, but even at that barely imaginable speed, Peekaboo was nearly four years away. I doubted we'd be able to get four hundred and something of us to Brasil Novo before the stellar shitrain arrived, even with a magic carpet to help.

I wasted a few seconds trying to work out how many of us could be saved, and how many would die of old age aboard the derelict *Sheffield* before a seat became available for them on the shuttle, and how they would be chosen. The maths were way beyond me, even if I'd known exactly how many of us were still alive. And so were the ethics.

It was not just a terrible letdown—it was also puzzling.

"What is it, Joel?" Evelyn asked.

How to put it? "I'm a little confused," I admitted finally.

"We're all confused," Dorothy said. "Which confusion troubles you now?"

If there was a way to say it pretty, I couldn't find it. "There really isn't any way you can be of much help to us with a ten-seater, even if it is twenty times faster than a speeding photon. Is there?"

Dorothy began to say something, but was overridden by Jinny. "There is a plan. As we speak, Grandfather and Andrew are discussing with your Captain Bean and his own advisers the feasibility o—"

"You're forgetting something," I said.

"What?"

"Jinny Hamilton," I said carefully, "you are one of the best. But I know exactly how you look and act and sound when you are lying."

Her control was excellent, but she could not stop her skin from reddening. She started a bluff but got only two chilly words in before giving it up and doing an instant one-eighty, so that the sentence came out, "How dare all right damn it, I was trying to keep this focused on the positive."

"That doesn't leave much to talk about," I said. "What I'm trying to understand is, since there doesn't seem to be any practical way to rescue us . . . why the hell are you here?"

"Joel!"

"There's damn little you can do for us—and for the life of me, I can't figure out anything we could possibly do for you."

"The whole Solar System just died!" she said. "Naturally we headed for the first—"

"If your grandfather just wanted company for comfort, why in Sol's name would he pick hundreds of doomed souls he can't help, with only a temporary ecology? It makes a million times more sense for him to make a beeline for someplace like Aradia or Hippolyte—they've both been thriving for decades. Or *any* of the self-sustaining colonies. Any technology we could possibly give you, any asset we could have aboard, you could get much better elsewhere, and without the social awkwardness of having to interact with dead people."

I stopped and waited for a response, but Jinny made none. "It's a simple question. Why are you—"

Dorothy Robb said, "Joel, don't be dense."

I stared at her.

Neither of the others had anything to say. They were both just looking at me. As if I had two—

"Covenant's sake! We're here because of *you,* you idiot."

I lost my handhold and went free.

I wasted seconds uselessly fanning air as if to agree I was an idiot, and then gave it up, surrendered to free fall, and tried to get control *of* my breath.

Nobody seemed to have a problem letting me take as long as I needed to think it through, so I did, eyes shut tight. It probably took a good thirty seconds to slow my spinning mind down from dynamo speed to something more like the cyclic rate of a prayer wheel.

I opened my eyes in time to see a thick cable within reach and docked on it.

"I don't believe it," I said slowly to Jinny. "Are you seriously telling me that you came all this way, played with the hopes of all these people, all my friends . . . just to give me the finger, one last time?"

"I made them come!" Evelyn cried.

Twenty-one

In my dreams
I can see, I can
I can see a love
That could be
—David Crosby,
"In My Dreams"

Evelyn, what—?"

That was as far as I could go. I could not even form a rational question.

No, wait. Yes I could.

"Evelyn, *why?"*

She had just let me think over an answer for a good half a minute. I gave her the same. So did the others. Jinny watched her intently, with no expression.

When she was ready, Evelyn said, "Joel, you were the first person I *ever* saw defy my grandfather. You are the only one I know who ever got away with it. You gave me the inspiration to become a musician—the only one in four entire generations of my family—in case perhaps that was the source of your courage. And it was! You're the only man I've ever known who thought it was a great thing to go to the stars—and went."

"But—"

"Shut up. That's part of it. You were the very first adult I ever met who took me seriously. Who did not talk down to me, because I was small. You treated me as an equal with an unfortunate height problem you were too polite to notice."

"That was—"

"I asked you to shut up. Because of that, you were the first adult I *ever* allowed to have any faintest idea how smart I was. Previous experiments had worked out badly. But it didn't bother you a bit to need my help, or to get it. It didn't even surprise you much."

"That's how my father always treated me at that age. I didn't know any other way to react."

"You were the first grownup to remember my name the second time he saw me. And before you let me help you, you asked if it would get me in trouble."

I tried to remember. Was all this true? It had been a long time ago.

But then, it had been longer for *her* than for me: thirteen years to my six since we'd cannoned into each other in the corridors of the North Keep—how could she remember so much better than I?

"You *didn't laugh at me."* She hesitated, then went on more softly, "Even when I told you I was going to marry you." Then far more softly, "And you were engaged then."

Jinny snorted, but did not speak.

Evelyn made a small measured movement, and began to drift toward me. Snow used to fall at about that speed in the low gravity of Ganymede, once. She came with infinite grace, and her eyes seemed to get larger faster than the rest of her.

"Joel Johnston, you were the first man ever to write to me. You're the longest pen pal I ever had. You are the only man who ever kept writing to me after it was clear that I was not going to have sex with him. No one else of either sex, ever, has given me their attention without expecting *anything* in return. My letters ended up having to be a tenth the size of yours, and carefully edited, thanks to Gran'ther *Dick* . . . and yours kept on coming anyway. And you are the only man I have ever known in my life or expected to who did not care one single solitary molecule of a damn how much money I had!"

She gently collided with me, for the second time in six of my years and thirteen of hers. She was taller, now. Her eyes were only decimeters from mine, this time. So was her mouth. Both her arms were around me.

I had both of mine around her. I must have let go of my handhold again. The room *literally* spun around us. She twined her calves around mine, completing the free-fall embrace. Our bellies touched, and we both discovered my waxing erection.

"I *bullied* them into coming for you," she said. "I said I would space myself if they did not. They knew I meant it. Right now, Gran'ther would rather cut off his own feet than lose fifty percent of the universe's remaining supply of egg-laying Conrads." Her voice dropped so low then that even I needed to follow her exaggerated lip movements to know she was adding, *"But . . . he . . . is . . . going to."*

It wasn't so much any of the words as looking at her mouth that forced me to kiss her.

Very little coherent thought took place during that kiss. So it must have gone on for a long time, because I had time to think that no woman in my life had ever given me her attention for so many years in a row for any reason, let alone without reasonable hope of any possible return. That she had done this for years before she'd ever heard me play a note. That she had learned to play because of me. That she was far and away the best kisser I had ever met or even fantasized. And that it would be very convenient if our first two children happened to take to the bass and drums. Drums first, no doubt.

Then our faces were whole decimeters apart again, and there was a ship around us.

"You *are* coming with us, right?" she asked solemnly

"I'm coming with *you,"* I said just as solemnly.

We both grinned at the same instant. "This is insane, right?" I asked her.

"Believe it," she agreed.

"Oh, thank heavens. For a second there I was afraid I was going sane."

"Little danger of that," Jinny said from across the room.

I glanced over at her, found her expressionless. I realized that not once during that timeless kiss had it even momentarily occurred to me that Jinny was watching us. It made me want to grin even wider, but it seemed politer not to. The disease had come close to killing me—but the cure was now complete. Andrew, poor bastard, was welcome to her. I wished him well, hoped he was genius enough to hold his own with her. He had licked lightspeed; maybe he could.

My heart suddenly sprang a leak, and joy started to leak out into reality. It began to sink in that I had no clear idea what was going to happen next, what I was going to do now. Or how I was going to live with myself afterward. I wanted with my whole heart to go with Evelyn, wherever she might go. But how could I leave so many of my friends—any of my friends—behind to die in the *Sheffield?* If I stayed, I could save at most one other life—if it hadn't been for me, *nobody* would have lived—those and a dozen other rationalizations raced through my mind, but were of no help whatsoever.

Evelyn saw the change in my face. From her distance she could scarcely have helped it. "Joel, what's wrong?"

I sighed. "I really hate with my whole heart the idea of leaving anyone at all to die of old age in this bucket. I don't know if I can . . . I don't know how to . . ." I did not even know how to express my dilemma, even to myself.

Dorothy Robb spoke up. "Am I the only one here comfortable with arithmetic?"

Everyone turned to stare at her.

She was frowning mightily "Admittedly, the math does become hairy. But surely *someone* must know how to operate a calculator."

"What do you mean, Dorothy?" Evelyn called.

She replied, "Joel, how many passengers does the *Sheffield* now carry?"

I wasn't at all sure. Too many deaths lately, no time to keep the figures current. "Can we call it four hundred and fifty for now?"

She nodded and closed her eyes, saying, "So: nine passengers at a time yields a total of fortyfive trips, with a series of geometrically decreasing trip lengths beginning with seventy-five lightyears—we assume zero turnaround time for convenience—" She stopped speaking, but her lips kept moving. We all gave her time. After a while she said, "Call it very roughly a hundred and fifty-one years."

My heart sank in my chest, but I nodded and kept going, needing to know just how bad it was. "How many could we transport in the first seventy or eighty years? You know, before we all die of old age."

Dorothy gave me the look a grandmother gives a child who has just picked his nose in company "Joel, Joel—those are a hundred and fifty-one *real* years."

"Pardon—oh!" My heart leaped.

"Since this ship is doing nearly ninety-eight percent of the speed of light, that works out to . . . hall a tick, now . . . a bit under thirty-three local, shipboard years."

Blood roared in my ears. *We could* all *live!* Her figures assumed zero turnaround, zero downtime for maintenance, and a lot of other things—but it didn't matter: the thing was *doable.* Andrew had saved us all.

This changed everything. For the first time since the quantum ramjet had gone out, I started to feel real hope. With it came a phantom memory of an ancient film about a man struggling with Time, who said to a companion near the end, "It's not the despair—I can live with the despair. It's the *hope* that's killing me!"

Well, being killed beats being dead. I'd been dying for two dozen years now, since the moment of my birth. Another seventy-five years of it sounded very good.

If I could spend them with Evelyn.

The hatch opened and Andrew entered, as if invoked by my thinking of him. Herb came in on his heels, must have guided him there.

"Hi, darling," was the first thing Andrew said, I noticed, and then, "Hello, everybody. I hope I'm not—" He saw me and Evelyn. "But apparently I am. I should have tapped first; crave pardon."

"Don't worry about it," Herb told him. "That's the way I usually find him."

"Usually with his girlfriend," I agreed.

Evelyn turned to me, eyes twinkling, and we gave each other our best deadpan. She was good; I nearly lost it. "So I'm going about this backward, then?" she asked.

"I for one work best in that mode," I told her. "Come on in, Andrew —I can work with an audience. How goes the confabulation?"

He looked pained. "Well, they're still discussing what should be done to evacuate the *Sheffield* as efficiently as possible. Your grandfather's come up with the seed of a very interesting plan, actually. Several problems still to be solved, of course, but . . . look, could we talk about it on the way? Richard sent me to tell you he'd be pleased if we all returned to the Mercury right away, and began preparing for an immediate launch. It's very important to lose as little time as possible, obviously, since every loss will cascade down through the whole sequence, and he's determined to hit the ground running."

Evelyn and I exchanged a glance and adjusted our position until we were side by side, each with an arm around the other's waist. "They're that close to agreeing on a plan?" Jinny asked.

Her husband shrugged. "Your grandfather wants to be under way two seconds after the airlock shuts behind him. We don't even know if all the provisions we were offered have been loaded aboard yet, much less stowed properly."

She nodded. "I guess we can continue the conversation there. Let's go."

"Wait a minute," I said. "Question."

"He just told you we don't have any minutes to spare," Jinny said sharply

"I agree with Andrew. But that begs my question: who's 'we,' exactly?" Everybody did a lot of blinking.

"Ten seats. Seven of you. If Evelyn has her way, I take seat number eight. Who gets the other two?"

Very *loud* blinking. Herb looked less sleepy than usual.

Andrew cleared his throat. "As I was leaving, Mr. Hattori had just agreed to join us."

"Really?" Jinny said. "Why?"

Andrew frowned. "To be honest, I'm not sure. It made sense when Richard explained it."

"Hattori!" Lieutenant Bruce squawked, ruining his efforts to avoid being caught eavesdropping. "Why in space should *he* get one of the first berths? He's a *bean counter!"*

Jinny's stare basted him with superheated contempt, and he withered. "I'm sure you would prefer to share your Bridge with people interested in your opinions, Lieutenant, so we will take our leave now. Your hospitality has been exceeded only by your courtesy. Shall we go, all?"

Evelyn turned her head to look at me. "Is there anything you want to pack, Joel?" One eyebrow rose slightly, copied accurately by the same side of her mouth. "Anyone you want to say goodbye to?"

I had absolutely no idea where we were going to go, or what we intended to do when we got there, or what if any contribution I could make.

I raised my voice a little. "Herb? Say goodbye to everybody for me, will you? You know how to say it pretty."

"If I don't get the tenth seat, sure," he called back. "Don't bother leaving me your porn folder; I hacked into it years ago."

"Captain Conrad?" I said at the same volume. "Would my baggage allotment aboard your ship accommodate a baritone saxophone?"

"Anna?" Evelyn asked.

I smiled. "You read liner notes carefully. Yes, my Yanigasawa."

Andrew called, "If it didn't, I'd tear out a couple of instrument panels or something."

He and I exchanged a look. "I'll meet you all at the airlock with my saxophone, then," I said.

Andrew pretended to clear his throat. "Joel, I hope you will forgive my presumption. I took the liberty of asking that your silver baritone be loaded aboard the *Mercury* shortly after our arrival. Evelyn said that was the one you'd want." His eyes went back and forth between Jinny and Evelyn twice. "It seemed the prudent course."

I knew what he meant. Jinny and Evelyn were twin forces of nature. If one of them said a man was coming aboard, the smart money said to save time and start loading his luggage. "I'm sure it was," I agreed, and a silent understanding passed between us. "Let's go, then. I'm eager to see your ship, Captain. I presume you docked down by the main passenger airlock?"

"That's right." He turned to Herb. "Mr. Johnson, will you accompany us? I can show you that thing I was talking about on our way up here." Herb nodded.

Bruce looked like he wanted to cry. Rennick looked like he could happily boil me. Dorothy looked like she wanted to suddenly extrude a judge's robes and marry Evelyn and me on the spot. Andrew looked as proud as a puppy who's learned some really amazing new tricks and is dying to show everyone.

And Evelyn looked like the rest of my life, smiling at me.

The trip was nearly the whole length of the ship, and took longer than I had expected. We did not pass a lot of people I knew well . . . we passed few people at all; it seemed a lot of us were waiting in our rooms to be told what the hell was going on. But of the few friends we did encounter, there were none that either Herb or I could bring ourselves to simply float past without a word of personal leave-taking. We also wanted to make sure the news spread as quickly as possible throughout the ship that everyone was going to get out of this alive, sooner or later. I never did find a really satisfactory way to say it in a few sentences. Herb did much better, of course. All but one of the reactions I got were positive, supportive. The one—Richie—just gaped at me, then turned and jaunted away without a word.

We had gotten all the way to the airlock antechamber before things started to shift around in my head.

I found myself thinking over everything that had been said since I'd gotten to the Bridge, and who had been saying it. Everything made sense, everything added up, except for a single term in the equation. It nagged at me. Gave me a faint sick feeling in the pit of my stomach that I could not seem to either justify or explain away.

I was so preoccupied I was barely paying attention to Andrew's eager babbling about his discovery, even though I did want very much to hear it. It was the genuine Secret of the Ages he was telling me. But I was distracted, and it didn't help that hardly anything he said conveyed much meaning to me.

Then all at once, three words leaped out of the noise, burrowed into my consciousness, and there exploded with great force. I lost my grip on my p-suit, and didn't bother jaunting after it.

"Andy" I interrupted rudely. "Did you just say, `. . .irrespective of . . .' a moment ago?"

He was struggling with his own p-suit, trying to get his feet in. He had the klutziness of the true supergenius. "Excuse me? Yes, Joel. Quite irrespective. As I was saying, the basis of the DIS principle—"

I stepped on him again. "Evelyn? Do you understand Andrew's drive? Has he explained it to you?"

She paused in her own suit-up checklist procedure. "He tried to," she said, puzzled but game. "It didn't take. I'm afraid I don't have anything like your background in physics."

I nodded. "Dorothy?"

She shook her head. "I was *handicapped* by my background in physics. It kept turning out that everything I thought I knew was wrong. I gave up listening at about the fourth sentence, when I seemed to hear him telling me that all mass is infinite in the first place."

"It is, in a sense," Andrew tried to explain. "You see—"

"Andrew, my new friend," I told him, "we don't. Very likely we can't. But I want to be as certain as I can be of at least one datum, so I'm going to ask you one more time. Have I just understood you to tell me that the DIS effect functions under any circumstances, *irrespective of mass?* Do those three words mean to you what they mean to us? Or is this some sort of semantic confusion?"

"No, you're correct," he said, puzzled. "Mass really is imaginary, you know. Like inertia. What you need to understand—"

I turned to Evelyn. "Do *you* get it?"

She was frowning hugely. Her own p-suit drifted away from her hands, forgotten. I saw understanding wash over her, like a wave of ice water. "Oh, no. Oh, no! Joel—"

Now the equation solved itself: the dubious term had been defined, and others adjusted themselves to match with the inexorable beauty of math working out.

"What are you talking about?" Jinny asked.

My stomach lurched. I turned and stared at her. "You know, don't you? Of course you do."

"I have no idea what you're talking about," she said.

"What does she know?" Herb asked me.

I could see from Dorothy's face that she got it, was thinking it through, and becoming as angry as I was. I could also see that Rennick had known all along, and was not even faintly surprised. He started edging toward the hatch that led back out into the rest of the Sheffield.

Uptake. Uptake was going to be important, now. I spoke quickly and in my loudest talking-to-the-audience voice.

"Everyone here has a mental picture of Richard Conrad. Can any one of you really picture him spending the next thirty-odd years rescuing a few hundred *farmers*?"

General consternation. Rennick made it all the way to the door and put his back to it.

"But he himself wouldn't—" Jinny began.

"Do you honestly think he believes that would be the best use for his one and only superluminal starship, during these next crucial empire-building decades?"

"He wanted to own the entire Solar System," Herb said. "Now he'll have to settle for what's left. But I think he would consider that the absolute minimum acceptable."

"My grandfather is with your own Captain this very minute, trying to—"

"Your grandfather is lying his aristocratic ass off at this minute," I said, "trying to persuade Captain Bean he's ever going to see him again after the Mercury leaves. That way he can consign more than four hundred people to death with an absolute minimum of harsh words or other unpleasantness. And we can all depart without Alice Dahl having to hold a gun on anyone."

"You're insane!" Jinny snapped.

"If he really wanted to help us, all he'd have had to do was order his grandson-in-law to unship his DIS drive from the *Mercury* . . . and install it in the *Sheffield!* Andrew just got finished telling us the silly thing *doesn't believe in mass."*

Jinny gasped in shock—but not as loud as her husband. "Coventry, what was I thinking of?" Andrew said, his face stricken. "I ... I . . . I'd have to destroy the Mercury in the process, I guess that's why it simply never occurred to me, but—yes, damn it to seven hells, there's no real reason in the universe why I couldn't recalibrate and ramp it up to make the field large enough to enfold even a ship this large. I could have it done in a few weeks! I think . . ."

"Don't destroy the *Mercury,"* Herb advised. "Just bring it aboard. It's about the size of one of our landing craft."

"That would work—"

"I heard earlier it took you five or six subjective weeks to overtake and match orbits with us," I told Jinny. "The *Mercury* was a private yacht on its shakedown cruise when Sol exploded. Even given Conrad family paranoia, I'd be surprised if she carried more than a couple of months' worth of provisions for a crew of seven. My guess is *your ship's just about out of food, water, and air by now*." Andrew's groan told me my guess was accurate. *"That's* why the old bastard really let himself be talked into picking us for his first destination! He needs to be fully reprovisioned before he reaches an established colony planet, so he can deal from a position of strength. To him, we're no more than a supplies cache en route, disposable. We're the smallest number of people that stand between him and self-sufficiency"

"And the easiest to con," Herb said. "Because we're scared and tired and vulnerable. And we have evidence other than Conrad's word that Sol has been destroyed and hellfire is coming."

"Oh, Grandfather," Evelyn groaned. "Oh, this is awful!" She started for the exit. "Joel, you're absolutely right: we have to—"

Rennick reached into his blouse and produced the smallest hand weapon I had ever seen, the size of a stylus, waved it across us all once. "You have to stay right where you are," he barked. "Evelyn, I mean it! *Don't!*" He aimed his weapon at her, and I gathered myself to leap into the line of fire, and his head exploded into red mist, most of which boiled out of existence even as it formed. A few tiny drops made it all the way across the room and spattered my face and hands. His little weapon flew from his hand and started caroming off things.

Dorothy Robb had something even smaller in her hand. It looked like the smaller half of a stylus, with the pocket clip on it. As I saw it, she released it like a soiled tissue and let it drift from her. "I thought I'd get all the way out of this life without ever using that," she said thoughtfully, as if to herself, in the sudden ringing silence. "But it was worth carrying it, all these years."

I wondered how she'd gotten it past the Gurkhas back home. But then, Rennick had managed with a larger one. Maybe the Gurkhas had known—and just figured they could deal with it. "Thank you, Dorothy," I managed to say, wiping my face with my sleeve.

"You may always leave these little things to me," she said, making it sound like a quote. Then she brushed a hand across her face and made a sound of revulsion. "I would not have thought his brain was large enough to make that much of a splash."

Herb was instantly at her side with a pack of tissues. She thanked him gravely and accepted one.

The heat of the explosion had briefly been so intense, Rennick's massive wound had cauterized itself. Most of the red mist had already been dealt with by the *Sheffield's* intensive zero-gee airflow, and the rest would be soon.

"They'll be here any minute," Herb said to me.

"I know," I said.

"You understand the problem. You've seen her."

I wished I didn't. "Yeah. I've seen Alice."

We shared a wordless glance that lasted ten seconds or more. He smiled suddenly "I don't see another way. Do you?"

I thought as hard as I know how. Finally, reluctantly, I shook my head no. "Not with the tools at hand."

He nodded.

I retrieved Dorothy's weapon, glanced at it briefly, and tossed it to him.

"It's empty," Dorothy said urgently "It was a single-shot."

Herb held it up. "Could you tell it's empty by looking at it?"

She made no reply, but her face said she understood now, and that the answer to his question was no.

A bounce took Rennick's weapon past me and I picked it out of the air. I looked around at the scene, studying it closely. Just behind me, beside the airlock hatch, was a large display showing data of several kinds.

I found the right switch and powered it off. Then I stepped back, measured angles, and said, "What do you think?" to Herb.

"Good as it's liable to get," he said. "This is what a long time ago used to be called a Hail Mary play."

I nodded. "I *really* wish it was better," I said.

With infinite kindness in his eyes, he said *not* "Me, too," but "I know." Then he moved, to position himself just beside the hatch out to the *Sheffield.* Dorothy began gathering the p-suits we hadn't finished donning, and stowing them out of the way

"What are you doing?" Jinny asked dangerously "Damn it, what is going on?" Andrew couldn't decide which of us to gape at. He wore a look I could empathize with—a man rearranging the entire contents of his brain, and heart.

"Can you handle her?" I asked Evelyn.

She looked me in the eye and said *not* "I think so," but, "Yes." Everybody was being very helpful to me today. I nodded thanks, and she left my side, jaunting over to dock beside Jinny.

"Cousin Jinny," she said clearly and firmly, "zip it."

Jinny was too shocked to respond, and before she could regroup, we all heard the sound of the party approaching the antechamber from outside. "Joel—" Dorothy began.

"I think it'll be all right," I told her. "But stay alert."

She shut up, chose a spot well away from the hatch, near the air outflow, and tugged Rennick's body there. She held onto the grille with one hand, and held Rennick near it with the other. "Evelyn, over here, dear."

Evelyn looked to me, I nodded, and she joined Dorothy.

Herb and I shared one last long look. Nothing to be said.

The hatch irised open.

Alice Dahl entered first, and she was as good as I had presumed she must be. The instant she cleared the hatchway she sensed that something was wrong—body language? Blood scent the airflow hadn't finished flushing yet?—and went hyperalert well before she could have seen Rennick's body. She didn't actually kill anyone, but she was very ready to. And it was me she focused on.

Failing to notice, Conrad came in behind her, followed by Solomon Short. "All right, everyone," he was saying, "thanks to Captain Bean's insights, and Relativist Short's gift for lateral thinking, I think we've come up with a plan that will—"

It took him that long to see Rennick's drifting corpse and stop speaking. He must have been very tired. But he was still sharp, and quick. He didn't bother asking what was wrong.

"All right," he went on. "Everyone on board now. We will discuss this later."

"Gran'ther, how *can* you?" Evelyn asked him with infinite sadness. He did not seem to understand her question.

"The race made a small mistake," Herb said. Alice's head turned to track him. "We did *finally* make some progress at stamping out war. But maybe it would have been better to start with greed."

"What's going on?" Solomon asked mildly

"Conman of Conman here," I said, "was just about to depart, leaving behind a boatful of suckers who thought he'd be coming back to start a rescue shuttle."

Solomon caught on at once, and turned to glare at Conrad. "Really?"

"He also forgot to mention to anybody that with a little work, Andy's Magic Carpet drive will push anything you put it in, just as fast. Irrespective of its mass."

Solomon's face darkened even further. "I see. He had better things to do with it. Sure, he did."

"Sol," I said quickly "It's *covered.* Okay? Watch out for green mist."

I saw him take my meaning. Stay out of the line of fire and await developments.

"Oh, for Covenant's sake!" Conrad snarled. "Jinny, *you* understand. Evelyn, dear, history is being made. Right now, by us. We need to form and consolidate the Confederation of Human Stars, get it organized. Ferry telepaths around until rational communication can take place, and then get busy and avenge our star. For all we know, a second wave of attacks is just about to happen—there is no *way* we have time to waste rescuing a bunch of losers from their own incompetence. Please try to be rational. You're a Conrad, for the—"

"I am a Johnston," she told him.

He rolled his eyes. "Young love. Oh, I love being old! Fine. I don't care what name you go by, as long as you get into that damned pressure suit and back aboard the ship, *now."*

She looked him in the eye and slowly shook her head. "I will not." Conrad of Conrad sighed, irritated beyond endurance. "Alice."

Alice Dahl reached for her right hip, and Time slowed to its lowest possible velocity

"Alice!" I shouted.

She was very good, gave me less than half her attention at first despite my shout.

That changed fast when she saw my hand holding the weapon I'd been palming all this time, though.

She was *so* good that in the fraction of an instant it took me to draw a dead bead on her center of mass, she had her own gun out and pointed directly at my left eye.

"If you kill me," she said calmly, "my hand will still kill you afterward."

"Probably." I agreed. Most of my attention was on my features, going for the best poker face of my life.

"Absolutely." she corrected.

Time was going so slowly now, I could actually see her discern some tiny flaw in my poker face. Her finger tightened on the trigger.

"Hey, Butch!" Herb bellowed at the top of his lungs.

She was still good. She turned her head *just* enough to pick him up in her peripheral vision. She knew he was bluffing, because she knew he was smart enough to know he could not possibly beat her—and still she checked.

And found Herb aiming Dorothy's tiny little weapon at her.

She identified it, must have realized it was much deadlier than the one I held. It didn't worry her a bit. The right side of her mouth curled up in contempt.

Faster than the eye could follow, she spun on her axis. Beating Herb was no more difficult than beating me had been for her.

And as far as Alice Dahl knew, nobody important wanted Herb alive. She shot him in his left eye, perfectly confident that shock and denial would hold a civilian like me frozen for the split second that was all she would need.

I was not in shock. I was not in denial. She died halfway back around to me, when my shot caught her square in the heart.

It was a far less gaudy death than *eit*her of the others that had happened in that room—but it was definitive. Rennick's weapon fired not a laser or projectiles, but something that relaxed muscles. All of them, completely. Her face went slack, her eyes became doll's eyes, her body went limp and derelict, and sphincters let go just before Solomon crashed into her.

My own nearly did the same. I had been more than half expecting to die myself, doing this. But I barely noticed; I was already in transit to Herb, just in case, knowing it was futile but unable to help myself. Halfway there I knew I was wasting my time, and started to relax and begin mourning.

An unexpected noise behind me scared the living shit out of me.

I wrenched my body around and just had time to realize Jinny had launched herself after me, hands curled into claws—when Evelyn slammed into her so hard her vector won the argument. They both drifted away from me, but only Evelyn was still conscious.

I collided with Alice's body myself, glanced off, and grabbed a handhold. Now my attention was fully on Andrew.

He couldn't take his eyes off Jinny. He was staring at her as if she had just morphed into some loathsome insect, or perhaps a demon with fangs.

I felt truly bad for him. I knew *exactly* how he must feel. The same as I had, when I'd first learned she wasn't who I'd thought she was at all. That she wasn't who she had *told* me she was. That she was capable of enormities I could not have imagined, and would not have believed until forced to. Nobody that beautiful should be capable of that much guile: it was too unfair an advantage.

She was everything her grandfather had hoped for. And little else.

I decided he would probably live through it, too. He might even be able to deal with it, somehow, for all I knew. He was a supergenius. And a decent man down to his marrow. I would try and have a long talk with him, as soon as I could. A series of them.

Richard Conrad inevitably found his voice. "All right, now," he began.

Andrew Jackson Conrad cut him off. "Grandfather," he said, "shut the fuck up."

Richard stared at him, more confounded by this than anything else that had occurred yet. He groped for words, found none at all.

"If you say one more word," his grandson-in-law said to him, "I will come over there and shove it down your throat."

"Way too kind," I heard Dorothy murmur.

I saw it wash over him, and if it hadn't been so pathetic I'd have enjoyed it more. For the first time in his entire life, Conrad of Conrad found himself in a room full of people ... not *one* of whom gave a damn what he did or did not want.

He had *always* been utterly alone—but had probably never even suspected it until now.

"Joel," Andrew continued, "I assume this ship carries proctors?"

"Good ones," I agreed.

"Will you summon one, please. This citizen requires restraint."

"As a matter of fact," I said, "he'll be here any second. The ship calls him if it decides he's needed. As soon as he gets here, I suggest we all adjourn back to my quarters, and start making some plans."

"Good," he said. "Will you help me get my wife to your Infirmary first?"

"Not to worry," I assured him. "My place is much closer, more comfortable ... and our Healer makes house calls. She is very good."

He nodded. "Thank you very much."

I told him he was welcome.

And then—finally—my obligations were over for the moment, and at long last I went to rejoin my Evelyn.

She was waiting for me.

We had been waiting for each other, for a long, long, long time. No matter what clock you used to measure it.

Twenty-two

**It's just beginning. Everything is
always just beginning.**

—Jakusho Kwong

That's essentially all I have to tell you.

Governor-General Cott's more formal account of the events of our voyage is vastly more complete, accurate, and factual. But it was felt that future generations will need more than facts. Too many of them make little or no sense without the subjective context. And it was decided that I was both best able to recount that story, from an insider's unique perspective—and the one least occupied with other, more pressing duties.

You have them, too. We all do, now. We need to know for certain, just as soon as possible, whether our civilization has been crippled and nearly killed by stupendous bad fortune—of which there is certainly no shortage in the cosmos—or by enemy action. And either way, we need to figure out what needs to be done about that.

I do not doubt we will. But you must hurry. You have a limited time now to move yourselves and your entire civilization underground, including all the native and introduced flora and fauna you need to survive . . . before the wavefront of death arrives, from the very part of the sky you've always thought of as home. You will need to be at least several hundred meters underground when it arrives; several thousand would be even better.

Yours is the fourth world we have brought the news to. At each of them, I have been asked why I don't simply stay? I've done my shift, and more. Why not let someone else take up the torch? Having miraculously managed, against incredible odds, to set my feet on solid ground once more, why would I ever contemplate leaving it again? Evelyn and I have a child to raise now, after all.

The best I can explain it is, I've lost my taste for living on planets. It always was overrated.

The narrator of an ancient poem by Tennyson "held his purpose firm, to sail beyond the sunset." My wife and I—all of us—have actually *done* that.

It's going to get *interesting* now.

Afterward

This is an optional bonus: a sort of DVD Special Feature, "The Making of *Variable Star,"* in which I explain how I ended up being the one to tell you the story. Feel free to save it for later, or skip it altogether. Its principal purpose is to save me from having to spend the next few years answering the same questions over and over, and I already suspect it's probably not going to work.

I type this in November of 2005, in my office on an island west of British Columbia . . . but for me, the whole thing began way over at the other end of the continent, in a New York suburb rightly called Plainview, fifty-one years ago in November of 1954, when I turned six years old.

My mother wanted to raise a literate son. But Mom also had a lot of resting she wanted to get done, so she came up with a diabolically efficient scheme for teaching me to read. She would start reading me a Lone Ranger comic book, and *just* as it got to the really exciting part, where the masked man was hanging by his fingertips from the cliff . . . Mom would suddenly remember she had to go wind the cat or fry the dishes. By age six I had taught myself to read out of sheer frustration.

On my birthday, she graduated me to the hard stuff. She drove me to a building called a "lie bury," and told me to go inside and ask the nice lady behind the desk for a book. I followed instructions. "Mom says gimme a book, lady" And the nice lady behind the desk sized me up thoughtfully, and handed me the very first book with no pictures in it that I ever read in my life: *Rochetship Galileo,* by Robert A. Heinlein.

Her name was Ruth Siegel. She changed my life completely.

It was the first of Robert's famous juvenile novels—and it was at least a hundred times better than the Lone Ranger! It was about teenage boys who were so smart they went to the Moon, and fought Nazis there, and there was nothing dopey about it, it all could have been true, practically! I finished it that night, and the next day I *walked* two miles to that lie bury and demanded to swap it for another one by the same guy. The same nice lady accommodated me, and the first *ten* books I ever read in my life were by Robert Heinlein, and they were *all* great.

When I tried other books, by other writers, it immediately became clear that some were good, and some were rotten. But it was just as clear that the ones in the same stack with the Heinleins—the ones that all had a sticker on their spine depicting a hydrogen atom inexplicably impaled by a V2—were *always* excellent, nearly as good as Heinlein himself. In 1954, science fiction was such a scorned genre that any sf actually published in hardcover—and then ordered by a public library—had to be terrific. I became a hardcore sf reader simply because that was where all the best stuff was . . . and so the whole course of my life was twisted.

Now the story jumps ahead nearly a year—and yanks us halfway back across the country again.

On November 14, 1955, ten days before my seventh birthday, Robert Anson Heinlein sat down at his desk in Colorado Springs and wrote an outline for a novel he first called *The Stars Are a Clock.*

He later wrote in half a dozen possible alternate titles by hand, including *Doctor Einstein's Clock,* but never settled on one he liked. This was not unusual for him. *A Martian Named Smith,* for instance, was also *The Heretic* for a while before it was finally published as *Stranger in a Strange Land.*

His outline filled at least eight extremely dense pages: single-spaced ten-pica type with absolutely minimal margins on all four sides and very few strikeovers. He also filled fourteen 3X5 index cards with extensive handwritten notes relating to the book. And then, for reasons only he could tell us, he closed the file and put it in a drawer, and never got around to writing that particular book.

Now the biggest jump of all: less mileage this time, but nearly fortyeight years—to Toronto on September 1, 2003, where the World Science Fiction Convention, Torcon 3, was held that year.

I was Toastmaster for that Worldcon, the second time I have endured that honor, and it went *infinitely* better than the first time had, the Saturday night Hugo Awards ceremony this time fiasco-free. So I was pleasantly relaxed on Sunday morning when I showed up for my last obligation of the weekend, an appearance on a panel discussion about rare and obscure works by Robert A. Heinlein. Some remarkable discoveries of previously unknown Heinleiniana had been made in recent years, including an entire first book few had known existed called *For Us, the Living,* which Scribner's had just published for the first time. I was on the panel because I had contributed an Introduction to it—but what I wanted to hear about was the exciting new stuff I'd heard rumors about. Teleplays—screenplays, even! I was quite unprepared for what I got.

The star panelist was Dr. Robert James, one of the researchers busily combing through the country's libraries for RAH references, standing in for official biographer Bill Patterson who had been unable to attend. Robert is the man personally responsible for rescuing *For Us, the Living* from oblivion, and Bill had given him some terrific ammunition from the Heinlein Collection at the University of California at Santa Cruz to wow us all with. Those teleplays, for instance: most were based on known short stories . . . but not all of them. *There were Robert Heinlein stories we didn't* know. That room was packed to bursting with some of the world's most hardcore Heinlein fans, and we were electrified by the news that the Canon was not yet quite complete, after all.

And that wasn't all. . . .

There was, Robert said, an outline for an entire *novel* that no one knew about, that Heinlein had never gotten around to writing. What it read like, he said, was a classic Heinlein Juvenile, and indeed it had been dreamed up around the time he was writing them, and—

--and from the back of the room, a woman I could not see called, in a loud, clear, melodious voice:

"You should get Spider Robinson to finish that novel."

And there was applause.

One of the other people on that panel was Eleanor Wood, literary agent for the estate of Robert A. Heinlein—and also, as it happens, for *me.* Another was Art Dula, trustee for the estate and its half-million dollar Heinlein Prize Trust (See www.heinleinprize.com for details) ... and Robert's literary executor. Glances were exchanged. Immediately after the panel ended, words were exchanged.

I was, please understand, profoundly terrified that this cup might actually come to me. It was quite literally the most difficult and intimidating challenge that could possibly be handed a science fiction writer, a red flag to critics. It was like a musician being asked to write, score, produce, perform, and record an entire album based on a couple of John Lennon demo cassettes. In boxing it's called leading with your chin. But I was fifty-five years old, just in the mood for the challenge of my life. Most of all, I wanted to read a new Heinlein novel so badly, I didn't care if I had to finish it myself, didn't care what kind of grief it cost me to do so.

Once again, a woman I didn't know had changed my life.

I'm delighted to report that she did not remain anonymous. I sent this Afterword around to some of those mentioned in it for corrections, and one of them was David M. Silver, President of the Heinlein Society *(www.heinleinsociety.org),* who was also on that panel. He was able to identify my benefactress as a member of his esteemed society. Thank you from the bottom of my heart, Kate Gladstone!

Shortly after I returned home from Torcon 3, I received Robert's outline, and permission to write two sample chapters and a proposal for Art Dula; if he liked them, the gig was mine. Wild with exultation, I fell upon that outline and read it three times with extreme care.

And then I began banging my head on my desk. Gently, at first.

You may recall I stated earlier that Robert's outline ran at least eight pages. It may have run fifty, for all anybody knows. What we *do* know is, seven of them survive.

They establish the ficton—Robert's term for time and place in which a story is set. They create vivid characters and their back stories, especially Joel, Jinny, and her grandfather. They describe the basic antinomy that impels Joel to emigrate, discuss the economics of interstellar colonization, and sketch in some of his early adventures after he leaves.

And then they chop off in midsentence, and midstory.

My God, I said to myself, the first time I finished reading the outline, there's *no* furshlugginer ending! *It could go anywhere from here.* . . .

God, this is *great!* I said to myself the second time I finished it, I *not only get to write a book* with *Robert, I get to pick the ending.*

Dear God, I moaned to myself after the third reading, what *the* hell am *I going to do for an ending?*

I holed up in my office for a week, and stared at those seven pages and fourteen quasilegible index cards and asked myself that question until beads of blood began to form on my forehead. Barring another miracle of forensic scholarship, this was going to be the very last Robert Heinlein novel ever. No ending I thought of seemed adequate. Twice a day my wife poked food in with a stick and retired to safety. I played my entire iTunes music library in search of inspiration, staring at its hypnotic visual display on my Powerbook screen, thinking like mad.

And one afternoon, iTunes finished playing the last Ray Charles album on my hard drive, and defaulted to the next artist in alphabetical order.

Robert Anson Heinlein.

Half a dozen short mp3 audio clips, of him being interviewed on radio in his hometown, Butler, Missouri, on its first-ever Robert A. Heinlein Day back in 1987, a year before his death. I'd listened to all those clips often. But the first one in line made me sit bolt upright in my chair now.

There—in my GrandMaster's Own Voice—was the rest of our novel, and the inspiration for its new title, in a single unscripted sentence. Two clips later, he said it *again,* in different words. Suddenly I recalled Robert griping to me once in a phone conversation about a story he'd always wanted to tell, that John W. Campbell had argued him out of writing. . . .

You have read both those soundbites. They were the chapter-opening quotes for Chapters 17 and 18.

That quickly, the novel finished itself in my mind. All that remained was the comparatively trivial business of writing those first two sample chapters and a proposal, winning Art's approval, marketing the novel, selling it to Tor Books—oh, yes, and then typing 115,051 words, configuring them in sentences, arranging those into paragraphs, and separating them into chapters. Every waking moment of two years of my life, tops.

Two Novembers later, the task is completed, to the best of my ability.

And well beyond. Fortunately I had help. Even more so than any of my previous thirty-two books, I could not conceivably have completed this one without the generous and patient assistance of many people far more knowledgeable and intelligent than myself. We have come now, in other words, to the closing credits

My principal consultants and unindicted co-conspirators were the gentlemen who have assisted me with all of my recent novels, the Vancouver Lunar Circle, particularly engineers Guy Immega and Ray Maxwell, physicist Douglas Beder, and astronomer Jaymie Matthews. Once my colleague and friend Allen M. Steele (www.allensteele.com) and noted rocket scientist Jordin Kare had helped me decide what kind of starship I wanted, Guy, one of my oldest friends, designed the *Sheffield* with Doug and Ray for me, treating the Ikimono Drive I handed them as a black box. Guy and his daughter Claire created Brasil Novo together in the course of a bedtime story they spent several years telling themselves, calling it "Jungle World," and latterly Jaymie added a few refinements to help it retain its atmosphere. Jaymie also figured out how to make its star satisfy the odd requirements I needed, and educated me about the destruction of my own star, its precursors and its consequences, as well as consulting on cosmology in general. Doug saved my bacon over and over, not only working and reworking complex relativistic computations in what appeared to be zero time, but continually suggesting ingenious ways to make the answers serve the needs of the story. And each of these Lunarians made invaluable comments on the work of the others.

Allen was also enormously helpful in helping me visualize what interstellar flight would actually be *like,* over a period of years, having devoted considerable thought to the matter for his own terrific Coyote novels. To help me imagine what a starship's farm that feeds five hundred might look like, however, I went straight to the man himself: Dr. Raymond M. Wheeler of NASA's Biological Sciences Office, who's designing the farm that will feed astronauts on their way to Mars; he gave generously of his time and special knowledge. The goat lore I acquired myself, painfully, a long time ago in Nova Scotia.

One more technical adviser must be thanked who, like Dr. Wheeler, had never previously helped me with a book, yet proved invaluable this time. Everything I know about the sax I learned by either listening to, watching, or questioning my friend Colin MacDonald, a composer, saxophonist, Soto Zen monk, and in his spare time (!) the keeper of my Web site www.spiderrobinson.com.

Nor will I ever forget the love and support of David Crosby, who gave me the chords and melody for "On the Way to the Stars"—not to mention the 1.67gHz G4 Powerbook on which *Variable Star* was researched and written. The music I listened to most often while I wrote was that of CPR, the band David and his older son James Raymond formed with Jeff Pevar (www.crosbycpr.com), and also the landmark 2004 Crosby • *Nash* double-album.

Numerous others also furnished invaluable ideas and insights, including Bob Atkinson, John Barnstead, Bill Patterson, Eleanor Wood, David Gerrold, Jef Raskin, Michael Lennick, James Gifford, Paul Hattori, Yoji Kondo, Herb Varley (who suggested the *Mercury* be powered by hyperphotonic swans), my editor Pat Lobrutto, and doubtless others I'm blanking on now. I hope they'll forgive me.

And *nobody's* input was more valuable or more profoundly appreciated than that of my beloved wife and partner, Jeanne, who read each day's copy when she woke up, and left extensive notes on my keyboard for me to find every night when I went to work; no one will ever suspect how many stupid mistakes she caught before anyone else got to see them, or how many neat ideas were really hers.

Once the story was complete, everybody named went over it looking for mistakes, misunderstandings, and problems, and then helped me repair them. So—crucially for my peace of mind—did my friends John Varley and David R. Palmer, both noted Heinlein experts, who went over the manuscript with great care and each made characteristically astute suggestions.

To all these people I give my deepest thanks. As always, any mistakes are my fault.

But it takes more than just technical advice to finish a novel. Especially this one.

First of all, and last of all, I want to say that without Jeanne's boundless love and rock-solid support, I would never have even dreamed of starting such a nerve-wracking project, and would probably have finished it, if I did, with a massive dependency on Ativan, or worse. She is my invariable star, and our orbit is stable. Equally invaluable were the unquestioning love and sensible advice of our remarkable daughter Terri Luanna, both an advertising exec and a social worker in the toughest town on Terra.

Art Dula took a major weight off my shoulders right from the start, by telling me, "I do *not* want you to try and do the literary equivalent of a Rich Little impression of Robert Heinlein. I want you to take his outline and write the best damn Spider Robinson novel you're capable of." He also gifted me with Robert's own, many-times-hand-repaired desk dictionary. I had Robert Heinlein's personal box of words to dip into, any time I ran short of them—and still do. Thank you, Art.

A mainstay of my morale throughout was Robert and Ginny's granddaughter, Dr. Amy Baxter, M.D., Jeanne and I met her and her husband, Louis Calderon, M.D., at Torcon 3, two nights before I sat on that panel and learned of the existence of an unwritten Heinlein novel, and we hit it off immediately. When she learned I had landed the commission, Amy promptly sent me a pair of her grandfather's Polynesian cuff links to wear as I typed, and sent Jeanne some of Ginny's jewelry to wear for me. (I was startled and amused to discover that it was necessary to send one of my shirts out to a tailor and have it retrofitted to accept cuff links—apparently they stopped having them while I wasn't looking.) By the time I was steaming into the home stretch of *Variable Star* in summer 2005, I was wearing Robert's treasured, threadbare favorite gardening shirt as I wrote out in my office, and Jeanne was in the house, in her own office, wearing Ginny's kimono. Bless you, Amy.

Other moral support and/or morale support (sometimes inadvertent or unsuspected) was provided by Daniel P Gautreau, Alex Morton, Anya Coveney-Hughes, Andrea MacDonald, Greg McKinnon, Bob Atkinson, George R. R. Martin, Parris McBride, Alex Grey, Joe and Gay Haldeman, Lawrence Block, Tom Robbins, Robert Crais, Donald E. Westlake, Amos Garrett, Gregg Carroll, Holger Petersen, Paul Pena, Seth Augustus, Moses Znaimer, Keith Hensen, Paul Krassner, David, Jan and Django Crosby, James Raymond, Graham Nash, Jens Stark, Gabrielle Morrissette, Rob Bailey, Kerry Yackoboski, Damien Broderick, James R. Cunningham, Brad Linaweaver, Robin W. Bailey, Steve and Lynn Fahnestalk, Will Soto, Evita Karlic, the Heinlein Society *(www.heinleinseciety.org),* Charles, Mary, and Jim Robinson, innumerable kind members of the Usenet group alt.callahans, and whoever I've forgotten to mention.

Finally, all the Portuguese names for Brasil Novo and its moons were furnished by my son-in-law, Heron Gonsalves da Silva, of Niteroi, Brazil—a classic young Heinlein Hero if there ever was one, who came to New York a few years ago without a dime, a reference, or a word of English, and is now studying electrical engineering at the same university I got my own degree from. *Obrigado, meu genro.*

Writing *Variable Star* has involved more work, more pressure, more fear, and above all, more sheer fun than all my other books put together. I hope it will be given to me to write another thirty-three, but I doubt any of them will come close to this.

Every time I've ever sat down to write anything, I've had Robert looking over my shoulder, of course, because he is my first template for How This Thing Should Be Done. But this time around, I felt his presence far more powerfully than ever before. In general it had a calming effect.

Only twice did it actually get spooky.

The first time, I frightened my wife badly when she discovered me heading out to my office *with the vacuum cleaner.* She was vastly relieved to learn I was not going insane, but merely being haunted: in fact, she roared with laughter when I finally admitted that Robert had stubbornly insisted he was *not* going to work in that goddamn pigsty until I mucked the place out.

The second time, it was *me* who got the willies. A friend had sent me the URL for a particularly thrilling NASA Quicktime movie: a full 360-degree true-color view of the surface of Mars from Sojourner. (Google it for yourself.) I was mousing my way around in a circle in wild exhilaration, like a drunken dervish, intoxicated by what I was doing, thinking to myself how thrilled Robert would have been to see this. *Check it out, Robert!* I cried in my mind. *A robot on the Red Planet, named after Miss Sojourner* Truth! *I'm sitting at my desk, using my mouse to pan around* Mars, *can you believe this?*

Just then, I moused past a series of surface irregularities just odd enough to catch my eye: a string of roughly spherical depressions in the coppery sand, separated by intervals of about the same distance. I wondered idly what they were.

At that moment, I heard a voice—an actual, physically audible voice—the well-remembered, unmistakable Missouri voice of Robert Heinlein—say, I swear to you, these two words: "Willis tracks."

Well, those bumps in the sand *did* indeed look just like the tracks that might be left by a Martian bouncer such as Willis, the star of Robert's classic juvenile novel *Red Planet,* now that I thought about it. But I *hadn't* been thinking about it. The hair stood up on the back of my neck, and I nearly crushed my mouse. If you'll pardon the expression.

That is my only actual ghost story, I'm happy to say. And I admit I was not cold sober that night. Nonetheless, I report that from start to finish, writing *Variable Star* has left me feeling Robert's presence and spirit far more strongly than I had since he caught a starship for parts unknown back in 1988.

I sincerely hope it has done the same for you.

—Bowen Island, B.C. 24 November 2005

Non-Fiction

WHY I SELECTED THE GREEN HILLS OF EARTH

For my taste, science fiction stories should not be about gadgets, but should be about people responding to problems created by gadgets —that is to say, responding to new environment created by advances in science.

This story is about 98% Rhysling, the blinded space bum, and about 2% gadgetry. Furthermore, it is concerned with some of my own strongly personal, emotional feelings about space travel. For such reasons it remains my own favorite of my stories.

The idea kicked around in my mind for five years, worrying me—but, being sighted myself, I had trouble with the characterization of a sightless man. During the War I met a young man who had been sightless from early childhood. He was operating powered machinery in an aircraft factory. Late in the War he was given the job of helping blinded veterans to reorient. In many cases their morale was gone—but a single day in the shop with this man was enough to change their attitudes completely. It was amazing—and enough to tear your heart out.

This story is dedicated to that gallant young gentleman and the veterans he worked with.

The phrase THE GREEN HILLS OF EARTH is from a story by C. L. Moore, the talented Mrs. Henry Kuttner. It is used by her gracious permission.

ROBERT A. HEINLEIN

SHOOTING DESTINATION MOON

“Why don’t they make more science fiction movies?”

The answer to any question starting, “Why don’t they—” is almost always, “Money.”

I arrived in Hollywood with no knowledge of motion picture production or costs, no experience in writing screen plays, nothing but a yen to write the first Hollywood picture about the first trip to the Moon. Lou Schor, an agent who is also a science fiction enthusiast, introduced me to a screen writer, Alford van Ronkel; between us we turned out a screen play from one of my space travel stories.

So we were in business—

Uh, not quite. The greatest single production problem is to find someone willing to risk the money. People who have spare millions of dollars do not acquire them by playing angel to science fiction writers with wild ideas.

We were fortunate in meeting George Pal of George Pal

Productions, who became infected with the same madness. So we had a producer—*now* we were in business.

Still not quite— Producers and financiers are not the same thing. It was nearly a year from the writing of the screen play until George Pal informed us that he had managed to convince an angel. (How? Hypnosis? Drugs? I'll never know. If I had a million dollars, I would sit on it and shoot the first six science fiction writers who came my way with screen plays.)

Despite those huge Hollywood salaries, money is as hard to get in Hollywood as anywhere. The money men in Hollywood write large checks only when competition leaves them no alternative; they prefer to write small checks, or no checks at all. Even though past the big hurdle of getting the picture financed, money trouble remains with one throughout production; if a solution to a special-effects problem costs thirty thousand dollars but the budget says five thousand dollars, then you have got to think of an equally good five thousand dollar solution—and that's all there is to it.

I mention this because there came a steady stream of non-motion-picture folk who were under the impression that thousand-dollar-a-week salaries were waiting for them in a science fiction picture. The budget said, "No!"

The second biggest hurdle to producing an accurate and convincing science fiction picture is the "Hollywood" frame of mind—in this case, people in authority who either don't know or don't care about scientific correctness and plausibility. Ignorance can be coped with; when a man asks "What does a rocket have to push against, out there in space?" it is possible to explain. On the other hand, if his approach is, "Nobody has ever been to the Moon; the audiences won't know the difference," it is impossible to explain anything to him; he does not know and does not want to know.

We had plenty of both sorts of trouble.

That the picture did not end up as a piece of fantasy, having only a comic-book relation to real science fiction1 can be attributed almost entirely to the integrity and good taste of Irving Pichel, the director. Mr. Pichel is not a scientist, but he is intelligent and honest. He believed what Mr. Bonestell and I told him and saw to it that what went on the screen was as accurate as budget and ingenuity would permit.

By the time the picture was being shot the entire company—actors, grips, cameramen, office people— became imbued with enthusiasm for producing a picture which would be scientifically acceptable as well as a box office success. Willy Ley's *Rockets and Space Travel* was read by dozens of people in the company. Bonestell and Ley's *Conquest* *of Space* was published about then and enjoyed a brisk sale among us. Waits between takes were filled by discussions of theory and future prospects of interplanetary travel.

As shooting progressed we began to be deluged with visitors of technical background—guided missiles men, astronomers, rocket engineers, aircraft engineers. The company, seeing that their work was being taken seriously by technical specialists, took pride in turning out an authentic job. There were no more remarks of "What difference does it make?"

Which brings us to the third hurdle—the *technical* difficulties of filming a spaceship picture.

The best way to photograph space flight convincingly would be to raise a few hundred million dollars, get together a scientific and engineering staff of the caliber used to make the A-bomb, take over the facilities of General Electric, White Sands, and Douglas Aircraft, and *build* a spaceship.

Then go along and photograph what happens.

We had to use the second-best method—which meant that every shot, save for a few before takeoff from Earth, had to involve special effects, trick photography, unheard-of lighting problems. All this is expensive and causes business managers to grow stomach ulcers. In the ordinary motion picture there may be a scene or two with special effects; this picture had to be *all* special effects, most of them never before tried.

If you have not yet seen the picture, I suggest that you do not read further until after you have seen it; in this case it is more fun to be fooled. Then, if you want to look for special effects, you can go back and see the picture again. (Adv.)

The Moon is airless, subject only to one-sixth gravity, bathed in undiluted sunlight, covered with black sky through which shine brilliant stars, undimmed by cloud or smog. It is a place of magnificent distances and towering mountains.

A sound stage is usually about thirty feet high, and perhaps a hundred and fifty feet long. Gravity is Earth normal. It is filled with cigarette smoke, arc light fog, and dust—not to mention more than a hundred technicians.

Problem: to photograph *in a sound stage* men making a rocket landing on the Moon, exploring its endless vistas, moving and jumping under its light gravity. Do this in Technicolor, which adds a sheaf of new problems, not the least of which is the effect of extra hot lights on men wearing spacesuits.

The quick answer is that it can't be done.

A second answer is to go on location, pick a likely stretch of desert, remove by hand all trace of vegetation, and shoot the “real” thing. Wait a minute; how about that black and star-studded sky? Fake it—use special effects. Sorry; once blue sky is on Technicolor emulsion it is there to stay. With black-and-white there are ways, but not with color.

So we are back on the sound stage and we *have* to shoot it there. Vacuum clear atmosphere? No smoking—hard to enforce—high speed on all blowers, be resigned to throwing away some footage, and leave the big doors open—which lets in noise and ruins the sound track. Very well, we must dub in the sound—and up go the costs—but the air *must* be clear.

Low gravity and tremendous leaps—piano wire, of course—but did you ever try to wire a man who is wearing a spacesuit? The wires have to get inside that suit at several points, producing the effect a nail has on a tire, i.e., a man wearing a pressurized suit cannot be suspended on wires. So inflation of suits must be replaced by padding; at least during wired shots. But a padded suit does not wrinkle the same way a pressurized suit does and the difference shows. Furthermore, the zippered openings for the wires can be seen. Still worse, if inflation is to be faked with padding, how are we to show them putting on their suits?

That sobbing in the background comes from the technical adviser—yours truly—who had hoped not only to have authentic pressure suits but had expected to be able to cool the actors under the lights by the expansion of gas from their air bottles. Now they must wear lamb’s wool padding and will have no self-contained source of breathing air, a situation roughly equivalent to doing heavy work at noon in desert summer, in a fur coat while wearing a bucket over your head. Actors are a hardy breed. They did it.

To get around the shortcomings of padded suits we worked in an “establishing scene” in which the suits were shown to be of two parts, an outer chafing suit and an inner pressure suit. This makes sense; deepsea divers often use chafing suits over their pressure suits, particularly when working around coral. The relationship is that of an automobile tire carcass to the inner tube. The outer part takes the beating and the inner part holds the pressure. It is good engineering and we present this new wrinkle in spacesuits without apology. The first men actually to walk the rugged floor of the Moon and to climb its sharp peaks, will, if they are wise, use the same device.

So we padded for wire tricks and used air pressure at other times. Try to see when and where we switched. I could not tell—and I saw the scenes being shot.

Now for that lunar landscape which has to be compressed into a sound stage—I had selected the crater Aristarchus. Chesley Bonestell did not like Aristarchus; it did not have the shape he wanted, nor the height of Crater wall, nor the distance to apparent horizon. Mr. Bonestell knows more about the surface appearance of the Moon than any other living man; he searched around and found one he liked—the crater Harpalus, in high northern latitude, facing the Earth. High latitude was necessary so that the Earth would appear down near the horizon where the camera could see it and still pick up some lunar landscape; northern latitude was preferred so that Earth would appear in the conventional and recognizable schoolroom-globe attitude.

Having selected it, Mr. Bonestell made a model of it on his dining room table, using beaverboard, plasticine, tissue paper, paint, anything at hand. He then made a pinhole photograph from its center — Wait; let's list the stages:

1. A Mount Wilson observatory photograph.
2. Bonestell's tabletop model.
3. A pinhole panorama.
4. A large blowup.
5. A Bonestell oil painting, in his exact detail, about twenty feet long and two feet high, in perspective as seen from the exit of the rocket, one hundred fifteen feet above the lunar surface.
6. A blown up photograph, about three feet high, of this painting.
7. A scenic painting, about four feet high, based on this photograph and matching the Bonestell colors, but with the perspective geometrically changed to bring the observer down to the lunar floor.
8. A scenic backing, twenty feet high, to go all around a sound stage, based on the one above, but with the perspective distorted to allow for the fact that sound stages are oblong.
9. A floor for the sound stage, curved up to bring the foreground of the scene into correct perspective with the backing.
10. A second back drop of black velvet and "stars."

The result you see on the cover of this issue. It looks like a Bonestell painting because it *is* a Bonestell painting—in the same sense that a Michelangelo mural is still the work of the master even though a dozen of the master's pupils may have wielded the brushes.

Every item went through similar stages. I was amazed at the thoroughness of preliminary study made by the art department—Ernst Fegte and Jerry Pycha—before any item was built to be photographed. Take the control room of the spaceship. This compartment was shaped like the frustrum of a cone and was located near the nose of spaceship *Luna*. It contained four acceleration couches, instruments and controls of many sorts, an airplane pilot's seat with controls for landing on

Earth, radar screens, portholes, and a hatch to the air lock—an incredibly crowded and complicated set. (To the motion picture business this was merely a “set,” a place where actors would be photographed while speaking lines.)

To add to the complications the actors would sometimes read their lines while hanging upside down in midair in this set, or walking up one of its vertical walls. Add that the space was completely enclosed, about as small as an elevator cage, and had to contain a Technicolor sound camera housed in its huge soundproof box—called a “blimp,” heaven knows why.

I made some rough sketches. Chesley Bonestell translated these into smooth drawings, adding in his own extensive knowledge of spaceships. The miniature shop made a model which was studied by the director, the art director, and the cameraman, who promptly tore it to bits. It wouldn’t do at all; the action could not be photographed, could not even be seen, save by an Arcturian Bug-Eyed Monster with eyes arranged around a spherical 3600.

So the miniature shop made another model, to suit photographic requirements.

So I tore that one apart. I swore that I wouldn’t be found dead around a so-called spaceship control room arranged in any such fashion; what were we making? A comic strip?

So the miniature shop made a third model.

And a fourth.

Finally we all were satisfied. The result, as you see it on the screen, is a control room which might very well be used as a pattern for the ship which will actually make the trip some day, provided the ship is intended for a four-man crew. It is a proper piece of economical functional design, which could do what it is meant to do.

But it has the unique virtue that it can be photographed as a motion picture set.

A writer—a fiction writer, I mean; not a screen writer—is never bothered by such considerations. He can play a dramatic scene inside a barrel quite as well as in Grand Central Station. His mind’s eye looks in any direction, at any distance, with no transition troubles and no jerkiness. He can explain anything which is not clear. But in motion pictures the camera has got to see what is going on and must see it in such a fashion that the audience is not even aware of the camera, or the illusion is lost. The camera must see all that it needs to see to achieve a single emotional effect from a single angle, without bobbing back and forth, or indulging in awkward, ill-timed cuts. This problem is always present in motion picture photography; it was simply exceptionally acute in the control room scenes. To solve it all was a real *tour de force*; the director of photography, Lionel Linden, aged several years before we got out of that electronic Iron Maiden.

In addition to arranging the interior for camera angles it was necessary to get the camera to the selected angles—in this enclosed space. To accomplish this, every panel in the control room was made removable— "wild," they call it—so that the camera could stick in its snout and so that lights could be rigged. Top and bottom and all its sides—it came apart like a piece of Meccano. This meant building of steel instead of the cheap beaverboard-and-wood frauds usually photographed in Hollywood. The control room was actually stronger and heavier than a real spaceship control room would be. Up went the costs again.

Even with the set entirely "wild" it took much, much longer to shift from one angle to another angle than it does on a normal movie set, as those panels had to be bolted and unbolted, heavy lights had to be rigged and unrigged—and the costs go sky high. You can figure overhead in a sound stage at about a thousand dollars an hour, so, when in the movie you see the pilot turn his head and speak to someone, then glance down at his instruments, whereupon the camera also glances down to let you see what he is talking about, remember how much time and planning and money it took to let you glance at the instrument board. This will help to show why motion picture theaters sell popcorn to break even—and why science fiction pictures are not made every day. Realism is confoundedly expensive.

Nor did the costs and the headaches with the control room stop there. As every reader of *Astounding* knows, when a rocket ship is not blasting, everything in it floats free—"free fall." Men float around—which meant piano wires inside that claustrophobic little closet. It was necessary at one point to show a man floating out from his acceleration couch and into the center of the room.

Very well; unbolt a panel to let in the wires. Wups! While a spaceship in space has no "up" or "down," sound stage three on Las Palmas Avenue in Hollywood certainly does have; supporting wires must run vertically—see Isaac Newton. To float the man out of the tight little space he was in would require the wires to turn a corner. Now we needed a Hindu fakir capable of the Indian rope trick.

The special effects man, Lee Zavitz, has been doing impossible tricks for years. He turned the entire set, tons of steel, on its side and pulled the actor out in what would normally be a horizontal direction. Easy!

So easy that the art department had to design, double gimbals capable of housing the entire set, engineer it, have it built of structural steel, have it assembled inside a sound stage since it was too big to go through the truck doors. Machinery had to be designed and installed to turn the unwieldy thing. Nothing like it had ever been seen in Hollywood, but it did enable a man to float out from a confined space and, later, to walk all around the sides of the control room with "magnetic" boots.

This double gimbals rig, three stories high, put-the control room set high in the air, so the carpenters had to build platforms around it and the camera had to be mounted on a giant boom—one so huge, so fancy, and so expensive that Cecil B. de Mule came over to inspect it. The camera itself had to be mounted in gimbals before it was placed on the boom, so that it might turn with the set—or the other way, for some special effects. This meant removing its soundproof blimp, which meant dubbing the sound track.

("Who cares? It's only money." Don't say that in the presence of the business manager, he's not feeling well.)

This was not the end of the control room tricks. Some of the dodges were obvious, such as making dial needles go around, lights blink on and off, television and radar screens light up—obvious, but tedious and sometimes difficult. Producing the effect of a ship blasting off at six gravities requires something more than sound track of a rocket blast, as the men each weigh over a thousand pounds during blast. Lee Zavitz and his crew built large inflated bladders into each acceleration couch. Whenever the jet was "fired" these blaaders would be suddenly deflated and the actors would be "crushed" down into their cushions.

A thousand pounds weight compresses the man as well as his mattress, which will show, of course, in his features. The makeup man fitted each actor with a thin membrane, glued to his face, to which a yoke could be rigged back of his neck. From the yoke a lever sequence reaching out of the scene permitted the man's features to be drawn back by the "terrible" acceleration. Part of what you see is acting by some fine actors, Dick Wesson, Warner AndersOn, Tom Powers, John Archer, part was a Rube Goldberg trick.

The air suddenly escaping from the bladders produced a sound like that of a mournful cow, thus requiring more dubbing of sound track. The air had to be returned to the bladders with equal suddenness when the jet cut off, which required a compressed air system more complicated than that used by a service station.

The sets abounded in compressed air and hydraulic and electrical systems to make various gadgets work— to cycle the air lock doors, to rig out the exit ladder, to make the instrument board work—all designed by Zavitz. Lee Zavitz is the man who "burned Atlanta" in Gone With The Wind, forty acres of real fire, hundreds of actors and not a man hurt. I saw him stumped just once in this film, through no fault of his. He was controlling an explosion following a rocket crash. It was being done full size, out on the Mojave Desert, and the camera angle stretched over miles of real desert. From a jeep back of the camera Zavitz was cuing the special effects by radio. In the middle of the explosions the radio decided to blow a tube—and the action stopped, ruining an afternoon's work. We had to come back and do it over the next day, after a sleepless night of rebuilding by the special effects crew. Such things are why making motion pictures produces stomach ulcers but not boredom.

The greatest single difficulty we encountered in trying to fake realistically the conditions of space flight was in producing the brilliant starry sky of empty space. In the first place nobody knows what stars look like out in space; it is not even known for sure whether twinkling takes place in the eye or in the atmosphere. There is plausible theory each way. In the second place the eye is incredibly more sensitive than is Technicolor film; the lights had to be brighter than stars to be picked up at all. In the third place, film, whether used at Palomar or in a Technicolor camera, reports a point light source as a circle of light, with diameter dependent on intensity. On that score alone we were whipped as to complete realism; there is no way to avoid the peculiarities inherent in an artificial optical system.

We fiddled around with several dodges and finally settled on automobile headlight bulbs. They can be burned white, if you don't mind burning out a few bulbs; they come in various brightnesses; and they give as near a point source of light as the emulsions can record—more so, in fact. We used nearly two thousand of them, strung on seventy thousand feet of wire.

But we got a red halation around the white lights. This resulted from the fact that Technicolor uses three films for the three primary colors. Two of them are back to back at the focal plane, but the red-sensitive emulsion is a gnat's whisker away, by one emulsion thickness. It had me stumped, but not the head gaffer. He covered each light with a green gelatin screen, a "gel," and the red halation was gone, leaving a satisfactory white light.

The gels melted down oftener than the bulbs burned out; we had to replace them each day at lunch hour and at "wrap up."

There was another acute problem of lighting on the lunar set. As we all know, sunlight on the Moon is the harshest of plastic light, of great intensity and all from one direction. There is no blue sky overhead to diffuse the light and fill the shadows. We needed a sound-stage light which would be as intense as that sunlight—a single light.

No such light has ever been developed.

During the war, I had a research project which called for the duplication of sunlight; I can state authoritatively that sunlight has not yet been duplicated. An arc light, screened by Pyrex, is the closest thing to it yet known— but the movies already use arc lights in great numbers, and the largest arc light bulb, the “brute,” is not nearly strong enough to light an entire sound stage with sunlight intensity— raw sunlight, beating down on the lunar set would have been equivalent to more than fifteen hundred horse power. There are no such arc lights.

We traced down several rumors of extremely intense lights. In each case we found either that the light was not sufficiently intense for an entire sound stage, or it was monochromatic—worse than useless for Technicolor.

We got around it by using great banks of brutes, all oriented the same way and screened to produce approximate parallelism. Even with the rafters loaded with the big lights almost past the safety point, it was necessary to use some cross lighting to fill gaps. The surface of the Moon had some degree of “fill” in the shadows by reflection from cliff walls and the ground; it is probable that we were forced to fill too much. We used the best that contemporary engineering provides—and next time will gladly use an atomic-powered simulation of the Sun’s atomic-powered light.

The simulation of raw sunlight was better in the scenes involving men in spacesuits outside the ship in space, as it was not necessary to illuminate an entire sound stage but only two or three human figures; a bank of brutes sufficed and no fill was needed, nor wanted, since there was no surrounding landscape to fill by reflection.

The effect was rather ghostly; the men were lighted as is the Moon in half phase, brilliantly on one side, totally unlighted and indistinguishable from the black sky itself on the other side.

This scene in which men are outside the ship in space involved another special effect—the use of a compressed oxygen bottle as a makeshift rocket motor to rescue a man who has floated free of the ship. The energy stored by compressing gas in a large steel bottle is quite sufficient for the purpose. I checked theory by experiment; opening the valve wide on such a charged bottle gave me a firm shove. The method is the same as that used to propel a toy boat with a CO2 cartridge from a fizz water bottle—the basic rocket principle.

We had considered using a shotgun, since everyone is familiar with its kick, but we couldn’t think of an excuse for taking a shotgun to the Moon. Then we considered using a Very pistol, which has a strong kick and which might well be taken to the Moon for signaling. But it did not look convincing and it involved great fire hazard in a sound stage. So we settled on the oxygen bottle, which looked impressive, would work, and would certainly be available in a spaceship.

However, since we were still on Las Palmas Avenue and not in space, it had to be a wire trick, with four men on wires, not to mention the oxygen bottle and several safety lines. That adds up to about thirty-six wires for the heavy objects and dozens of black threads for the safety lines—and all this spaghetti must not show. Each man had to have several "puppeteers" to handle him, by means of heavy welded pipe frames not unlike the cradles used by Tony Sarg for his marionettes, but strong enough for men, not dolls. These in turn had to be handled by block and tackle and overhead traveling cranes. Underneath all was a safety net just to reassure the actors and to keep Lee Zavitz from worrying; our safety factor on each rig was actually in excess of forty, as each wire had a breaking strength of eight hundred pounds. To top it off each man had to wear a cumbersome, welded iron, articulated harness under his spacesuit for attachment of wires. This was about as heavy and uncomfortable as medieval armor.

The setups seemed to take forever. Actors would have to be up in the air on wires for as long as two hours just to shoot a few seconds of film. For ease in handling, the "oxygen bottle" was built of balsa wood and embedded in it was a small CO2 bottle of the fire extinguisher type. This produced another headache, as, after a few seconds of use, it would begin to produce carbon dioxide "snow," which fell straight down and ruined the illusion.

But the wires were our real headache. One member of the special effects crew did nothing all day long but trot around with a thirty-foot pole with a paint-soaked sponge on the end, trying to kill highlights on the wires. Usually he was successful, but we would never know until we saw it on the screen in the daily rushes. When he was not successful, we had to go back and do the whole tedious job over again.

Most of creating the illusion of space travel lay not in such major efforts, but in constant attention to minor details. For example, the crew members are entering the air lock to go outside the ship in free fall. They are wearing "magnetic" boots, so we don't have to wire them at this point. Everything in the airlock is bolted down, so there is nothing to spoil the illusion of no up-and-down. Very well—"Quiet, everybody! Roll 'em!"

"Speed!" answers the sound man.

"Action!"

The actors go to the lockers in which their spacesuits are kept, open them—and the suits are hanging straight down, which puts us back on Las Palmas Avenue! “Hold it! Kill it! Where is Lee Zavitz?”

So the suits are hastily looped up with black thread into a satisfactory “floating” appearance, and we start over.

Such details are ordinarily the business of the script girl who can always be depended on to see to it that a burning cigarette laid down on Monday the third will be exactly the same length when it is picked up on Wednesday the nineteenth. But it is too much to expect a script girl to be a space flight expert. However, by the end of the picture, our script clerk, Cora Palmatier, could pick flaws in the most carefully constructed space yarn. In fact, everybody got into the act and many flaws were corrected not because I spotted them but through the alertness and helpfulness of others of the hundred-odd persons it takes to shoot a scene. Realism is compounded of minor details, most of them easy to handle if noticed. For example, we used a very simple dodge to simulate a Geiger counter—we used a real one.

A mass of background work went into the flight of the spaceship Luna which appears only indirectly on the screen. Save for the atomic-powered jet, a point which had to be assumed, the rest of the ship and its flight were planned as if the trip actually were to have been made. The mass ratio was correct for the assumed thrust and for what the ship was expected to do. The jet speed was consistent with the mass ratio. The trajectory times and distances were all carefully-plotted, so that it was possible to refer to charts and tell just what angle the Earth or the Moon would subtend to the camera at any given instant in the story. This was based on a precise orbit—calculated, not by me, but by your old friend, Dr. Robert S. Richardson of Mount Wilson and Palomar Mountain.

None of these calculations appears on the screen but the results do. The Luna took off from Lucerne Valley in California on June 20th at ten minutes to four, zone eight time, with a half Moon overhead and the Sun just below the eastern horizon. It blasted for three minutes and fifty seconds and cut off at an altitude of eight hundred seven miles, at escape speed in a forty-six-hour-orbit. Few of these data are given the audience—but what the audience sees out the ports is consistent with the above. The time at which they pass the speed of sound, the time at which they burst up into sunlight, the Bonestell backdrops of Los Angeles County and of the western part of the United States, all these things match up. Later, in the approach to the Moon, the same care was used.

Since despite all wishful thinking we are still back on Las Pahmas Avenue, much of the effect of taking off from Earth, hurtling through space and landing on the Moon had to be done in miniature. George Pal was known for his “Puppetoons” before he started producing feature pictures; his staff is unquestionably the most skilled in the world in producing three-dimensional animation. John Abbott, director of animation, ate, slept, and dreamed the Moon for months to accomplish the few bits of animation necessary to the gaps in the live action. Abbott's work is successful only when it isn't noticed. I'll warrant that you won't notice it, save by logical deduction, i.e., since no one has been to the Moon as yet, the shots showing the approach for landing on the Moon must be animation—and they are. Again, in the early part of the picture you will see the Luna in Lucerne Valley of the Mojave Desert. You know that the ship is full size for you see men-climbing around it, working on it, getting in the elevator of the Gantry crane and entering it—and it is full size; we trucked it in pieces to the desert and set it up there. Then you will see the Gantry crane pull away and the Luna blasts off for space.

That can't be full size; no one has ever done it.

Try to find the transition point. Even money says you pick a point either too late or too soon.

The Luna herself is one hundred fifty feet tall; the table top model of her and the miniature Gantry crane are watchmaker's dreams. The miniature floodlights mounted on the crane are the size of my little fingertip— and they work. Such animation is done by infinite patience and skill. Twenty-four separate planned and scaled setups are required for each second of animation on the screen. Five minutes of animation took longer to photograph than the eighty minutes of live action.

At one point it seemed that all this planning and effort would come to nothing; the powers-that-be decided that the story was too cold and called in a musical comedy writer to liven it up with—*sssh*!—sex. For a time we had a version of the script which included dude ranches, cowboys, guitars and hillbilly songs on the Moon, a trio of female hepsters singing into a mike, interiors of cocktail lounges, and more of the like, combined with pseudoscientific gimmicks which would have puzzled even Flash Gordon.

It was never shot. That was the wildest detour on the road to the Moon; the fact that the *Luna* got back into orbit can be attributed to the calm insistence of Irving Pichel. But it gives one a chilling notion of what we may expect from time to time.

Somehow, the day came when the last scene had shot and, despite Hollywood detours, we had made a motion picture of the first trip to the Moon. Irving Pichel said, "Print it!" for the last time, and we adjourned to celebrate at a bar the producer had set up in one end of the stage. I tried to assess my personal account sheet—it had cost me eighteen months' work, my peace of mind, and almost all of my remaining hair.

Nevertheless, when I saw the "rough cut" of the picture, it seemed to have been worth it.

Preface

"It does not pay a prophet to be too specific."
-L. SPRAGUE DE CAMP

The stories in this and later volumes of this series were not written as prophecy, nor as history. The author would be much surprised if any one of them turned out to be close enough to future events to be classified as successful prophecy.

They are of the "What-would-happen-if—" sort, in which the "if", the basic postulate of each story, is some possible change in human environment latent in our present day technology or culture. Sometimes the possibility is quite remote, as in "LifeLine"; sometimes the postulated possibility is almost a certainty, as in the series concerned with interplanetary flight.

The pseudohistory of the immediate future outlined in the chart you will find in this volume makes it appear that I was seriously attempting prophecy. The appearance is illusory; the chart was worked up, a bit at a time, to keep me from stumbling as I added new stories. It was originally a large wall chart in my study, to which I added pencilled notes from time to time. This was an idea I had gotten from Mr. Sinclair Lewis, who is alleged to maintain charts, files, notes and even very detailed maps of his fictional state of Winnemac and its leading city, Zenith. Mr. Lewis has managed to make Zenith and its citizens more real to more people than any real midwestern city of comparable size. I figured that a technique which was good for Mr. Lewis would certainly be good for me; I swiped the idea. I am glad to be able to acknowledge publicly my debt.

In 1940 I showed the chart to John W. Campbell, Jr.; he insisted on publishing it. From then on I was stuck with it; it became increasingly difficult to avoid fitting a story into the chart. I was forced to invent several pen names for use when I had a story in mind which was entirely incompatible, with the assumed "history". By now I hardly need the chart; the fictional future history embodied in it is at least as real to me as Plymouth Rock.

This series was started ten years ago; this past decade has been as revolutionary in technology as the century which preceded it. Increasingly each year the wild predictions of sciencefiction writers are made tame by the daily papers. In my chart you will find "booster guns" assigned to one hundred years in the future—but the Germans designed such guns during World War II. The chart gives 1978 as the date of the first rocket to the Moon; I will give anyone odds that 1978 is the wrong date, but I will *not* bet that it will not be sooner.

"Blowups Happen" is a case in point. This story was written a few months after the first word of fission of uranium reached this country, long before the Manhattan (atom bomb) Project was set up. During the few months between writing and first printing, the story went in and out of dale five times, so rapidly did atomics march. It has now been revised in a few details to bring it in line with present knowledge; it will undoubtedly go out of date in its details soon. But of this we may be sure: the basic idea of the story will never go out of date, for atomic power in many of its aspects will continue to be fantastically dangerous both individually and socially-and men will continue to work with it despite all danger.

Details change; the drama continues. Technology races ahead while people remain stubbornly the same. Recently I counted fourteen different sorts of astrology magazines on one news stand-but not one magazine on astronomy. There were only three hundred years from Plymouth Rock to atomic power; there are still more outhouses than flush toilets in the United States, the land of inside plumbing. And the radio will not have changed much on the day when men first walk the silent face of the Moon.

The anomalies of the Power Age are more curious than its wonders.

But it is a great and wonderful age, the most wonderful this giddy planet has yet seen. It is sometimes comic, too often tragic, and always wonderful. Our wildest dreams of the future will be surpassed by what lies in front of us. Come bad, come good, I want to take part in the show as long as possible.

ROBERT A. HEINLEIN

Colorado Springs, Colo.

PREFACE

The first sciencefiction anthology merited a reader's examination as something new; the nineteenth (or fiftieth; the number changes rapidly) cannot plead that justification and needs a reason for being other than the well-known hunger of writers, editors, and publishers.

The purpose of this book is to give you pleasure.

The stories have been selected to entertain, and within the very broad category of "speculative fiction," no other criterion has been used. Our intention has been to bring together good stories, ones which give pleasure on rereading and which have not previously been available in book form. These stories may possibly instruct, mystify, elevate, or inspire; if so, consider such to be bonuses not covered by the purchase price; our single motive is to entertain you.

Science fiction has only recently become popular and is not yet fully respectable. Until the end of World War II it was, in the opinion of most critics, by definition "trash" and so convicted without a hearing. The scientific marvels of World War II—radar, atom bombs, giant rockets—and the rather spectacular success of sciencefiction writers in predicting these things combined to cause a widespread postwar interest in speculative fiction, stories about the future, which in time forced the professional critics to notice this stepchild of literature.

And yet one may pause to wonder why the stepchild was so completely ignored before the war. Quite aside from the pulp specialty magazines, many worthwhile, deeply thoughtful novels of this genre were available to the critics before World War II, for example, S. Fowler Wright's monumental The World Below, or Olaf Stapledon's philosophical novels of the future of our race. And many of the standard literary lions had ventured at least one science fiction novel. Why should so much of J. B. Priestley's reputation rest on Angel Pavement while The Doomsday Men is almost unheard of? Why was there a rage for The Green Hat while Michael Arlen's Man's Mortality made hardly a ripple? The four authors cited cannot possibly be accused of being semiliterate hacks suited only to publication on pulpwood paper and catering to that portion of the public which moves its lips while reading. Why were their serious works in speculative fiction ignored?

I'll chance a guess. The story about the future never has fitted comfortably into the implicitly defined limits of serious literature. In the prose field, "literature" in the stuffy and respectable sense usually meant either the historical novel or certain rather pedestrian types of the contemporary novel. One gathers the impression that it helps for the author to be dead or to have had the good judgment to write his story first in a language less well known than English, but these are not indispensable requirements. Rather ponderous length seems to be part of the unspoken definition, extensive research should be either self-evident or claimed, and dialogue is usually sparse and not too sprightly. A clearly stated regional scene is a help too, especially if it is back country. Such a novel the literary critic can take in his stride, read in one evening, and compose his review while shaving. It either does or does not come up to his standards and he knows why. Either way, it is an accepted type and a serious piece of work.

Science fiction does not fit into this frame; it's a much more exotic art. The critic may find himself shying away from this literary freak. He can judge quickly whether or not it is grammatical and readable, but what about the content? A man who has applied himself seriously to the field of English literature may not have had time to be well-read in geology, nuclear physics, rocket engineering, astrophysics, genetics, cosmogony, cybernetics, chemistry, biophysics, and electronics. Can he afford to recommend this item as a serious and worthwhile work? Does the author know what he is talking about—or is the rude fellow pulling one's leg? Perhaps his "science" is of the Sunday-supplement variety, in which case one would not wish to recommend it. But how is one to know?

The dilemma is quite real, for there are many stories around which bear the same close superficial resemblance to honest science fiction that a lead quarter does to a product of the Denver mint. The critic is hardly to be blamed if he chooses to pass up extravagant stories of the future in favor of the tried and true.

Science fiction is even less prepared to compete for attention in the most modern of the ultra-literary school. Sciencefiction heroes are almost always likable, rarely psychotic (the mad scientist has had his day), and they almost never fall in love with their sisters or their fathers' wives or mistresses. The writers of science fiction without exception favor clear, lucid, grammatical sentences; I do not guarantee against an occasional split infinitive, but they never write in a Joycean or neoFreudian mishmash. As you can see, the fiction of the future is much too old-fashioned to win even a passing nod from the avant-garde school critics. Perhaps it is just as well.

Let me add that the skilled practitioners (no other sort are represented in this volume) have learned not to lard their stories with obscure and polysyllabic technical terms and have learned how to define in context such few special terms as may be indispensable to following the story. They have even given up the long-cherished practice of assigning to natives of other planets names consisting mainly of throat-rasping gutturals. I must admit that sparsely dressed and exceedingly nubile young ladies still appear on the covers of some of the specialist magazines, but they are rarely to be found now in the stories inside those same magazines; their persistence on the covers is simply a part of the same phenomenon to be found in cigarette, automobile, and deodorant ads.

Literature or not, science fiction is here to stay; it will not be crowded out even by the new Plunging-Neckline school of the historical novel, nor by the four-letter-word school of the contemporary novel. Youths who build hotrods are not dismayed by spaceships; in their adult years they will build such ships. In the meantime they will read stories of interplanetary travel—and they are being joined by their entire families. The future rushes at us apace, faster than sound, approaching the speed of light; the healthy-minded are aware of our headlong plunge into a strange and different, possibly terrifying, future and see nothing improper in speculating about the shape of tomorrow.

Science fiction is sometimes miscalled "escape literature," a mistake arising from a profound misconception of its nature and caused by identifying it with fantasy. Science fiction and fantasy are as different as Karl Marx and Groucho Marx. Fantasy is constructed either by denying the real world in toto or at least by making a prime basis of the story one or more admittedly false premise—fairies, talking mules, trips through a looking glass, vampires, seacoast Bohemia, Mickey Mouse. But science fiction, no matter how fantastic its content may seem, always accepts all of the real world and the entire body of human knowledge about the real world as the framework for the fictional speculation. Since the field of human knowledge concerning the real world, its natural laws, events, and phenomena, is much too large for any one brain, every sciencefiction author is bound to make some slips, but here it is the intention that counts: the author's purpose is not to escape from reality but to explore seriously the complex and amazing manifold of possibilities which lie unrevealed in the future of our race—to explore them in the light of what we do know now.

If such is escape literature, then so is an insurance policy.

(There is only one story here, "I'm Scared," by Jack Finney, which could possibly be called "escape literature"—but it provides no escape for the reader. Better skip it.)

All of the stories herein are honest science fiction, but there is another type of story masquerading as science fiction which circulates like the lead quarters mentioned earlier. Call it "pseudoscientific fantasy." The writers thereof are either too ignorant or too careless to do the painstaking work required to produce honest speculation. Much of it gets printed, unfortunately, since all editors cannot be expected to be erudite in all fields of knowledge. Nor do you find it only in the pulp magazines with the pretty bare-skinned ladies and the bug-eyed monsters on the covers; it is as likely to pop up in the most respected slick-paper magazines or between the boards of dignified tradebook houses. Such stories may be rife with spaceships, ray guns, and mutant monsters, but they are marked by a crude disregard for established fact. However, knowledge of the world about us and of the scientific facts which describe its functioning is rather widespread these days; the effect of such barbarisms on the reader who does happen to know that the facts are being manhandled is much like that which would arise from the reading of a "historical" novel which asserted that Henry VIII was the son of Queen Elizabeth, or a war story in which the writer was under the impression that corporals were senior to master sergeants. It is to be hoped that, as the public increases in sophistication in these matters, such writers will find it necessary to go back to working for a living. In the meantime, such slips as you may find in this book are the honest mistakes of honest workmen; I think I can vouch that such errors as exist do not invalidate the stories in which they appear.

Science fiction is not fantasy, but it can certainly be fantastic—and be assured that the more fantastic it is, the more wild, the more extravagant it sounds, it is that much more likely to be a reasonably correct extrapolation of what our real future will be. Regard the difference between the 1900 horse-and-buggy and the 1950 faster-than-sound plane. Our fictional prophecies almost certainly err on the side of conservatism. In this book you will find stories of space travel (of course!), a gambol in the fourth dimension, telekinesis, robots, intelligent plants, strange nonhuman creatures from the other side of the galaxy, and invasions from Mars. The Wonderful Land of Oz has not more to offer—and none of it is fantasy.

Did I hear someone describe robots as fantasy? I myself find humanoid robots hard to believe in, but who am I to set my prejudices against the facts? I put it to you that a B-36 in flight is a fair example of a robot activated by a controlling human brain. I submit further that it is a longer step from the covered wagon to the B36 than it is from present cybernetic machines to Dr. Asimov's "positronic robots." But can a machine have consciousness, life, volition? We don't know, because we do not as yet know what any of those things are. Meanwhile, robotics is a legitimate field for speculation.

Time travel? We don't understand the nature of time; it is much too early to say that time travel is impossible. Telekinesis? Refer to the abstruse reports pouring out of Duke University and elsewhere, then resolve never again to bet on dice. The control of mass by the human mind is as factually established as yesterday's sunrise. (Tomorrow's sunrise is, of course, only a high probability.) For the impact that telekinesis may have on your grandchildren—or on you—see "The Barnhouse Effect" herewith. Space travel? Go down to White Sands, watch them throw one of the big ones away, and be convinced. Space travel is about to move from speculative fiction to contemporary fiction and news story, and some of us are a wee bit wistful about it. How can we dream up wonderful new Martians when the National Geographic starts running photographs of real ones?

One story is included here almost as a period piece—"Rainmaker."

When first published shortly after World War II this piece was science fiction; now the commercial trade of rainmaking has reached the point where lawsuits dealing with it clutter the courts. Technology has overtaken prophecy. But a good story is not ruined thereby; "Rainmaker" is still fun to read.

Besides, it is clinching demonstration of the vast difference between pseudoscientific fantasy and the real article. But it is the fact that "Rainmaker" was and remains a pleasure to read that controlled its inclusion here; we the editors are strongly convinced that sciencefiction pieces should be stories, warm and human, not thinly disguised engineering reports. On that note this essay will close in order that you may get on with the real purpose of this book, the reading of stories about people who might be your grandchildren, facing new problems in this wildly fantastic universe. Each story has been read and reread by each of five editors—and enjoyed each time; we expect that you will enjoy them too.

My thanks to the other four—Truman Talley, Judith Merril, Fred Pohl, and Walter Bradbury.

ROBERT A. HEINLEIN Colorado Springs

RAY GUNS AND ROCKET SHIPS

"When I make a word do a lot of work like that," said Humpty Dumpty, "I always pay it extra."

"Science Fiction" is a portmanteau term, and many and varied are the things that have been stuffed into it. Just as the term "historical fiction" includes in its broad scope *Quo Vadis,* nickel thrillers about the James Boys or Buffalo Bill, and *Forever Amber,* so does the tag "science fiction" apply both to Alley Oop and to Aldous Huxley's *After Many a Summer Dies the Swan.* It would be more nearly correctly descriptive to call the whole field "speculative fiction" and to limit the name "science fiction" to a sub-class—in which case some of the other sub-classes would be: undisguised fantasy (Thorne Smith, the Oz books), pseudoscientific fantasy (C. S. Lewis's fine novel *Out of the Silent Planet,* Buck Rogers, Bradbury's delightful Martian stories), sociological speculation (More's *Utopia,* Michael Arlen's *Man's Mortality,* H. G. Wells' *The World Set Free,* Plato's *Republic*), adventure stories with exotic and nonexistent locales (Flash Gordon, Burroughs' Martian stories, the *Odyssey, Tom Sawyer Abroad*). Many other classes will occur to you, since the term "speculative fiction" may be defined negatively as being fiction about things that have not happened.

One can see that the name "science fiction" is too Procrustean a bed, too tight a corset, to fit the whole field comfortably. Nevertheless, since language is how we talk, not how we might talk, it seems likely that the term "science fiction" will continue to be applied to the whole field; we are stuck with it, as the American aborigines are stuck with the preposterous name "Indian."

But what, under rational definition, is *science* fiction? There is an easy touchstone: science fiction is speculative fiction in which the author takes as his first postulate the real world as we know it, including all established facts and natural laws. The result can be extremely fantastic in content, but it is not fantasy; it is legitimate—and often very tightly reasoned—speculation about the possibilities of the real world. This category excludes rocket ships that make U-turns, serpent men of Neptune that lust after human maidens, and stories by authors who flunked their Boy Scout merit badge tests in descriptive astronomy.

But the category includes such mindstretchers as Olaf Stapledon's *Last and First Men,* William Sloane's *To Walk the Night,* Dr. Asimov's *The Stars, Like Dust,* even though these stories are stranger than most outright fantasies.

But how is one to distinguish between legitimate science fiction and ridiculous junk? Place of original publication is no guide; some of the best have appeared in halfcent-a-word pulp magazines, with bug-eyed monsters on their covers; some of the silliest have appeared in high-pay slicks or in the "prestige" quality group.

"The Pretzel Men of Pthark"—that one we can skip over; the contents are probably like the title. Almost as easy to spot is the Graustark school of space opera. This is the one in which the dashing Nordic hero comes to the aid of the rightful Martian princess and kicks out the villainous usurper through superscience and sheer grit. It is not being written very often these days, although it still achieves book publication occasionally, sometimes with old and respectable trade book houses. But it does not take a Ph.D. in physics to recognize it for what it is.

But do not be too quick to apply as a test to science fiction what are merely the conventions of better known fields of literature. I once heard a librarian say that she could not stand the unpronounceable names given by sciencefiction writers to extraterrestrials. Have a heart, friend! These strings of consonants are honest attempts to give unearthly names to unearthly creatures. As Shaw pointed out, the customs of our tribe are not laws of nature. You would not expect a Martian to be named "Smith." (Say—how about a story about a Martian named "Smith"? Ought to make a good short. Hmmmm—)

But are there reliable criteria by which science fiction can be judged by one who is not well acquainted with the field? In my opinion, there are. Simply the criteria which apply to all fields of fiction, no more, no less.

First of all, an item of science fiction should be a story, i.e., its entertainment value should be as high as that which you expect from other types of stories. It should be entertaining to almost anyone, whether he habitually reads the stuff or not. Second, the degree of literacy should be as high as that expected in other fields. I will not labor this point, since we are simply applying an old rule to a new field, but there is no more excuse here than elsewhere for split infinitives, dangling participles, and similar untidiness, or for obscurity and doubletalk.

The same may be said for plotting, characterization, motivation, and the rest. If a sciencefiction writer can't *write,* let him go back to being a fry cook or whatever he was doing before he gave up honest work.

I want to make separate mention of the author's evaluations. Granted that not all stories need be morally edifying, nevertheless I would demand of sciencefiction writers as much exercise of moral sense as I would of other writers. I have in mind one immensely popular series which does not hold my own interest very well because the protagonist seems to be guided only by expediency. Neither the writer nor his puppet seems to be aware of good and evil. For my taste this is a defect in any story, nor is the defect mitigated by the wonderful and gaudy trappings of science fiction. In my opinion, such abstractions as honor, loyalty, fortitude, self-sacrifice, bravery, honesty, and integrity will be as important in the far reaches of the Galaxy as they are in Iowa or Korea. I believe that you are entitled to apply your own evaluating standards to science fiction quite as rigorously as you apply them in other fiction.

The criteria outlined above take care of every aspect of science fiction but one—the *science* part. But even here no new criterion is needed. Suppose you were called on to purchase or to refuse to purchase a novel about a Mexican boy growing up on a Mexican cattle ranch; suppose that you knew no Spanish, had never been to Mexico and were unacquainted with its history and customs, and were unsure of the competence of the author. What would you do?

I suspect that you would farm out the decision to someone who was competent to judge the authenticity of the work. It might be a high school Spanish teacher, it might be a friend or neighbor who was well acquainted with our neighboring culture, it might be the local Mexican consul. If the expert told you that the background material of the book was nonsense, you would not give the book shelf room.

The same procedure applies to science fiction. No one can be expected to be expert in everything. If you do not happen to know what makes a rocket go when there is no air to push against, you need not necessarily read Willy Ley's *Rockets, Missiles, and Space Travel*—although it is a fine book, a "must" for every library, desirable for any home. You may instead consult anyone of your acquaintance who *does* know about rocket ships—say an Air Force or Artillery officer, a physics teacher, or almost any fourteen-year-old boy, especially boys who are active in high school science clubs. If the novel being judged concerns cybernetics, nuclear physics, genetics, chemistry, relativity, it is necessary only to enlist the appropriate helper.

You would do the same, would you not, with a novel based on the life of Simón Bolívar?

Of course, there is the alternate, equivalent method of testing the authenticity of any book by checking on the author. If the Simón Bolívar novel was written by a distinguished scholar of South American history, you need concern yourself only with the literary merit of the book. If a book about space travel is written by a world-famous astronomer (as in the case of the one who writes under the pen name of "Philip Latham"), you can put your mind at rest about the correctness of the science therein. In many cases sciencefiction writers have more than adequate professional background in the sciences they use as background material and their publishers are careful to let you know this through catalog and dustjacket blurb. I happen to be personally aware of and can vouch for the scientific training of Sprague de Camp, George O. Smith, "John Taine," John W. Campbell, Jr., "Philip Latham," Will Jenkins, Jack Williamson, Isaac Asimov, Arthur C. Clarke, E. E. Smith, Philip Wylie, Olaf Stapledon, H. G. Wells, Damon Knight, Harry Stine, and "J. J. Coupling." This listing refers to qualifications in science only and is necessarily incomplete, nor do I mean to slight the many fine writers without formal scientific training who are well read in science and most careful in their research.

But some means of checking on a writer of alleged science fiction is desirable. Most writers of historical fiction appear to go to quite a lot of trouble to get the facts of their historical scenes correct, but some people seem to feel that all that is necessary to write science fiction is an unashamed imagination and a sprinkling of words like "ray gun," "rocket tube," "mutant," and "space warp." In some cases the offense is as blatant as it would be in the case of an author of alleged historical fiction who founded a book on the premise that Simón Bolívar was a Chinese monk! It follows that, in order to spot these literary fakers it is necessary to know that Bolívar was not a Chinese monk—know something of the sciences yourself or enlist competent advisers.

Concerning Stories Never Written: Postscript

THIS aside is addressed primarily to you who have read the first two volumes of this series rather grandly titled "Future History." Volume One, *The Man Who Sold the Moon,* is laid from right now until the closing years of this century and ends with mankind's first faltering steps toward space. some of the stories are so close to the presenttime as already to be outdated by events—an occupational hazard I share with weather forecasters and fortune tellers. Volume Two, *The Green Hills of Earth,*** is concerned with the great days of exploration of the Solar System. All of the stories take place somewhere close around the year 2000 A.D. If you refer to the chart in the flyleaf of this volume, you will see that this second group of stories appears to cover about twenty-five years, but this appearance is a deceptive shortcoming of typography— printing the titles on the chart requires a certain minimum of space. Nor does the order matter materially—some of the stories overlap in time but concern different characters in differing scenes.

This present Volume Three starts about seventy-five years later than the end of the last story in Volume Two—and a great amount of "Future History" has taken place between the two volumes. *Green Hills* ended with the United States a leading power in a system wide imperialism embracing all the habitable planets. But the very first page of the first story in this book finds the United States plunged in a new Dark Ages no longer space minded, isolationist even with respect to this planet, and under a theocracy as absolute as that of Communism.

The effect on the reader could be a little like that which sometimes results from unskillful editing of magazine serials— the sort of thing in which one installment ends with the hero hanging by his heels over the snake pit while the sinister villain leers at him from above, only to have the next installment start with our hero walking up Fifth Avenue, debonair and undamaged.

I could plead the excuse that these stories were never meant to be a definitive history of the future (concerning which I know no more than you do), nor are they installments of a long serial (since each is intended to be entirely independent of all the others). They are just stories, meant to amuse and written to buy groceries.

*Shasta Publishers, Chicago, 1950; New American Library, 1951. * Shasta Publishers, Chicago, 1951; New American Library, 1952.*

Nevertheless, I think that you who are kind enough to buy this volume are entitled to more explanation as to the great hiatus between the second and the third volume. On the chart you will see three titles in parentheses between the last story in *Green Hills* and the first story in this book; these three stories, had they ever been written, would have covered the intervening three quarters of a century and might well have been an additional volume in this series.

The first of these unwritten stories, *The Sound of His Wings,* starts shortly before *Logic of Empire* and continues for several years beyond the ending of *Logic;* it would have recounted the early life, rise as a television evangelist, and subsequent political career of the Reverend Nehemiah Scudder, the "First Prophet," President of the United States and destroyer of its Constitution, founder of the Theocracy.

The second story, *Eclipse,* parallels somewhat both the American Revolution and the breakup of colonialism taking place on this planet today, for it is concerned with the colonies on Mars and on Venus becoming self-sufficient and politically mature and breaking away from Mother Earth, followed by almost complete cessation of interplanetary travel. *Logic of Empire* suggests some of the forces that led to the breakdown. Interplanetary travel will be tremendously expensive at first; if the home planet is no longer in a position to exploit the colonies, trade and communication might dwindle almost to zero for a long period—indeed the infant nations might pass "Non-Intercourse Acts."

The Stone Pillow was intended to fill the gap between the establishment of the Theocracy and its overthrow in the Second American Revolution. It was to have been concerned with the slow buildup of a counterrevolutionary underground. It gets its name from the martyrs of the underground, those who rested their heads on pillows of stone—in or out of prison. These revolutionaries would be in much the same nearly hopeless position that anti-Communists have found themselves in these thirty years past in the U.S.S.R., but the story would have concerned itself with the superiority of the knife to the atom bomb under some circumstances and with the inadvisability of swatting mosquitoes with an axe.

These three stories will probably never be written. In the case of *Eclipse* I have dealt with the themes involved at greater length in two novels which were not bound by the Procrustean Bed of a fictional chart; it would be tedious for both you and me to deal with the same themes again. As for the other two stories, they both have the disadvantage of being "down beat" stories; their outcomes are necessarily not pleasant. I am not opposed to tragedy and have written quite a bit of it, but today we can find more than enough of it in the headlines. I don't want to write tragedy just now and I doubt if you want to read it. Perhaps in another and sunnier year we will both feel differently. -

In any case, I feel that even Caruso, Cleopatra, or Santa Claus could overstay their welcomes; it may be that this pseudohistory has already taken more curtain calls than the applause justifies.

I am aware that the themes of the unwritten stories linking the second and this the third volume thus briefly stated above have not been elaborated sufficiently to lend conviction, particularly with reference to two notions; the idea that space travel, once apparently firmly established, could fall into disuse, and secondly the idea that the United States could lapse into a dictatorship of superstition. As for the first, consider the explorations of the Vikings a thousand years ago and the colonies they established in North America. Their labors were fruitless; Columbus and his successors had to do it all over again. Space travel in the near future is likely to be a marginal proposition at best, subsidized for military reasons. It could die out -then undergo a renascence through new techniques and through new economic and political pressures. I am not saying these things will happen, I do say they could happen.

As for the second notion, the idea that we could lose our freedom by succumbing to a wave of religious hysteria, I am sorry to say that I consider it possible. I hope that it is not probable. But there is a latent deep strain of religious fanaticism in this, our culture; it is rooted in our history and it has broken out many times in the past. It is with us now; there has been a sharp rise in strongly evangelical sects in this country in recent years, some of which hold beliefs theocratic in the extreme, anti-intellectual, anti-scientific, and anti-libertarian.

It is a truism that almost any sect, cult, or religion will legislate its creed into law if it acquires the political power to do so, and will follow it by suppressing opposition, subverting all education to seize early the minds of the young, and by killing, locking up, or driving underground all heretics. This is equally true whether the faith is Communism or HolyRollerism; indeed it is the bounden duty of the faithful to do so. The custodians of the True Faith cannot logically admit tolerance of heresy to be a virtue.

Nevertheless this business of legislating religious beliefs into law has never been more than sporadically successful in this country—Sunday closing laws here and there, birth control legislation in spots, the Prohibition experiment, temporary enclaves of theocracy such as Voliva’s Zion, Smith’s Nauvoo, a few others. The country is split up into such a variety of faiths and sects that a degree of uneasy tolerance now exists from expedient compromise; the minorities constitute a majority of opposition against each other.

Could it be otherwise here? Could any one sect obtain a working majority at the polls and take over the country? Perhaps not—but a combination of a dynamic evangehst, television, enough money, and modern techniques of advertising and propaganda might make Billy Sunday’s efforts look like a corner store compared to Sears Roebuck. Throw in a depression for good measure, promise a material heaven here on earth, add a dash of anti-Semitism, anti-Catholicism, antiNegroism, and a good large dósè of anti-”furriners” in general and anti-intellectuals here at home and the result might be something quite frightening—particularly when one recalls that our voting system is such that a minority distributed as pluralities in enough states can constitute a working majority in Washington.

I imagined Nehemiah Scudder as a backwoods evangelist who combined some of the features of John Calvin, Savonarola, Judge Rutherford and Huey Long. His influence was not national until after the death of Mrs. Rachel Biggs, an early convert who had the single virtue of being the widow of an extremely wealthy man who shared none of her religious myopia—she left Brother Scudder several millions of dollars with which to establish a television station. Shortly thereafter he teamed up with an ex-Senator from his home state; they placed their affairs in the hands of a major advertising agency and were on their way to fame and fortune. Presently they needed stormtroopers; they revived the Ku Klux Klan in everything but the name—sheets, passwords, grips and all. It was a “good gimmick” once and still served. Blood at the polls and blood in the streets, but Scudder won the election. The next election was never held.

Impossible? Remember the Klan in the ‘Twenties—and how far it got without even a dynamic leader. Remember Karl Marx and note how close that unscientific piece of nonsense called *Das Kapital* has come to smothering out all freedom of thought on half a planet, without—mind you—the emotional advantage of calling it a religion. The capacity of the human mind for swallowing nonsense and spewing it forth in violent and repressive action has never yet been plumbed.

No, I probably never will write the story of Nehemiah Scudder; I dislike him too thoroughly. But I hope that you will go along with me in the idea that he *could* happen, for the sake of the stones which follow. Whether you believe in the possibility of the postulates of these stories or not, I hope that you will enjoy them—at my age it would be very inconvenient to have to go back to working for a living.

ROBERT A. HEINLEIN

Colorado Springs, Colorado

THE THIRD

MILLENNIUM OPENS

Now, at the beginning of the year 2001, it is time to see where we have been and guess at where we are going. A thousand years ago Otto III ruled the Holy Roman Empire, William the Conqueror was not yet born, and the Discovery of America was almost five hundred years in the future. The condition of mankind had not changed in most important respects since the dawn of history. Aside from language and local custom a peasant of 1000 B.C. would have been right at home in a village of 1001 A.D.

He would not be so today!

The major changes took place in the last two centuries, but the most significant change of all occurred in the last fifty years, during the lifetimes of many of us. In 1950 six out of ten persons could neither read nor write; today an illiterate person is a freak.(1)

More people have learned to read and write in the past fifty years than in all the thousands of years preceding 1950.

This one change is more worldshaking than the establishment this last year of the laboratory outpost on Pluto. We think of this century just closed as the one in which mankind conquered space; it would be more appropriate to think of it as the century in which the human race finally learned to read and write.

(Let's give the Devil his due; the contagious insanities of the past century—communism, xenophobia, aggressive nationalism, the explosions of the formerly colonial peoples—have done more to spread literacy than the efforts of all the do-gooders in history. The Three R's suddenly became indispensable weapons in mankind's bloodiest struggles—learn to read, or die. Out of bad has come good; a man who can read and write is nine-tenths free even in chains.)

But something else has happened as important as the ABC's. The big-muscled accomplishments of the past fifty years—like sea-farming, the fantastic multiplication of horsepower, and spaceships, pantographic factories, the Sahara Sea, reflexive automation, tapping the Sun—overshadow the most radical advance, i.e., the first fumbling steps in founding a science of the human mind.

Fifty years ago hypnotism was a parlor trick, clairvoyance was superstition, telepathy was almost unknown, and parapsychology was on a par with phrenology and not as respectable as the most popular nonsense called astrology.

Do we have a "science of the mind" today? Far from it. But we do have—

A Certainty of Survival after Death, proved with scientific rigor more complete than that which we apply to heat engines. It is hard to believe that it was only in 1952 that Morey Bernstein, using hypnotic regression, established the personal survival of Bridget Murphy—and thereby turned the western world to a research that Asia and Africa had always taken for granted.(2)

Telepathy and Clairvoyance for Military Purposes. The obvious effect was the changing of war from a "closed" game to an "open" game in the mathematical sense, with the consequence that assassination is now more important than mass weapons. It may well be that no fusion bomb or plague weapon will ever again be used—it would take a foolhardy dictator even to consider such when he knows that his thoughts are being monitored . . . and that assassination is so much harder to stop than a rocket bomb. He is bound to remember that Tchaka the Ruthless was killed by one of his own bodyguard.

But the less obvious effect has been to take "secrecy" wraps off scientific research. It is hard to recall that there was once a time when scientific facts could not be freely published, just as it is hard to believe that our grandfathers used to wear things called "swimming suits"—secrecy in science and swimming with clothes on are almost equally preposterous to the modern mind. Yet clothing never hampered a swimmer as much as "classification" hampered science. Most happily, controlled telepathy made secrecy first futile, then obsolete.(3)

But possibly the most important discovery we have made about ourselves is that *Man is a Wild Animal.* He cannot be tamed and remain Man; his genius is bound up in the very qualities which make him wild. With this self-knowledge, bleak, stern, and proud, goes the last hope of permanent peace on Earth; it makes world government unlikely and certainly unstable. Despite the fact that we are (as always) in a condition of marginal starvation, this fact makes all measures of population control futile—other than the ancient, grisly Four Horsemen, and even they are not effective; we finished World War III with a hundred million more people than when we started.

Not even the H-bomb could change our inner nature. We have learned most bloodily that the H-bomb does nothing that the stone axe did not do—and neither weapon could tame us. Man can be chained but he cannot be domesticated, and eventually he always breaks his chains.

Nor can we be "improved" by genetic breeding; it is not in our nature to accept it. Someday we may be conquered by superbeings from elsewhere, then bred according to their notions—and become dogs, rather than wolves. (I'm betting that we will put up a fight!) But, left to our own resources, improvements in our breed must come the hard way, through survival . . . and we will still remain wild animals.(4)

But we have barely begun to study ourselves. Now that mankind has finally learned to read and write what can we expect him to accomplish?

We have no idea today of how self-awareness is linked to protoplasm. Now that we know that the ego survives the body we should make progress on this mystery.

Personal survival necessitates *Cosmic Purpose* as a "least hypothesis" for the universe. Scientists are tending to take teleology away from theologians and philosophers and give it a shaking. But concrete results this century seem unlikely. As of now, we still don't know why we are here or what we are supposed to do—but for the first time in history it is scientifically probable that the final answers are not null answers. It will be interesting indeed if one of the religious faiths turns out to be correct to nine decimals.

Since ESP talents seem to be independent of spacetime it is theoretically possible that we may achieve a mental form of time travel. This is allowable under the mathematics being developed to describe mind phenomena. If so, we may eventually establish history, and even prophecy, as exact sciences.

On the physical side we can be certain that the speed-of-light barrier will be cracked this century. This makes it statistically likely that we will soon encounter races equal or superior to ourselves. This should be the most significant happening to mankind since the discovery of fire. It may degrade or destroy us, it may improve us; it cannot leave us unchanged.

On the mundane side we can expect a population of five billion by the middle of this century. Emigration to other planets will not affect the total here.

Scientific facts will continue to be discovered much faster than they can be classified and cross-referenced, but we cannot expect any accompanying increase in human intelligence. No doubt the few remaining illiterates will continue to be employed in the subscription departments of periodicals; the same bigmouths who now complain about rocket service to Luna (but who can't thread a needle themselves) will in 2050 be complaining about service to the stars (and they still won't be able to thread a needle).

Unquestionably the Twentieth Century will be referred to as the "Good Old Days," we will continue to view with alarm the antics of the younger generation, and we probably will still be after a cure for the common cold.

Notes: 1980

1. He's still a freak but he's all too common. There is a special circle in Hell for the "Educators" who decided that the Three R's really weren't all that important. Concerning our public schools today: Never

have so many been paid so much for so little. I thank whatever gods there be that I went to school so many years ago that I had no choice but to be tightly disciplined in classes in which the teachers did not hesitate to fail and to punish.

My first-grade class had 63 kids in it, one teacher, no assistant. Before the end of the second semester all 63 could read.

2. Many people seem to feel that the "Bridey Murphy" case has been invalidated. Maybe so, maybe not—the investigative reporter who went to Ireland had no special qualifications and the "disproof" came from Time magazine. Time magazine probably publishes many facts . . . but since its founding in the early 1920's I have been on the spot eight or nine times when something that wound up as a news story in Time happened. Not once—not once—did the Time magazine story match what I saw and heard.

I have the "Bridey Murphy" recording and Bernstein's book about it. I am not an expert witness . . . but I found the recording highly interesting. To me it sounded like what it purported to be: regression under hypnosis to memory of a former existence. Some years later I learned from an ethical hypnotherapist (i.e., he accepted patients only by referrals from M.D.'s, his own doctorate being in psychology) that regression to what seemed to be former lives was a commonplace among patients of hypnotherapists—they discussed it among themselves but never published because they were bound by much the same rule as physicians and priests taking confession.

I have no data to offer of my own. I decided many years back that I was too busy with this life to fret about what happens afterwards. Long before 2001 I will know . . . or I will know nothing whatever because my universe has ceased to exist.

3. Anyone today who simply brushes off ESP phenomena as being ridiculous is either pigheaded or ignorant. But I do not expect controlled telepathy by 2001; that is sheer fiction, intended to permit me to get in that bit about Tchaka, et al.

4. I lifted this "Man is a wild animal" thesis bodily from Charles Gallon Darwin (grandson of the author of The Origin of Species) in his book The Next Million Years, Doubleday, 1953. I am simply giving credit; I shan't elaborate here. But The Next Million Years is a follow-on to The Origin of Species and is, in my opinion, one of most important works of this century. It has not been a popular book—but I seem to recall that his grandfather's seminal work wasn't too popular, either.

WHO ARE THE HEIRS OF PATRICK HENRY?

STAND UP AND BE COUNTED!

"Supreme excellence in war is to subdue the enemy without fighting."

—Sun Tzu, ca. 350 B.C.

The Soviet Union is highly skilled at this—and so are the Chinese leaders. During the last twenty-odd years we have been outmaneuvered endlessly. Today it's the Backfire bomber (a B-1 with a Russian accent); tomorrow it is an international (U.N.) treaty to socialize all aspects of space and thereby kill such enterprise as the L-5 Society, Sabre, Otrag (already killed), Robert Truax's Do-It-Yourself projects. The treaty will permit a KGB agent ("A rose by any other name—") to inspect in detail anything of ours, private or public, on the ground or in the sky, if it is **in any way** *connected with space—or the KGB man claims to suspect that it might be.*

(But if you think that gives us a free ticket into every building, every room, at the Byakonur space complex, you don't know how the USSR does business.)

The President has already announced that he will sign it. 10 to 1 he will, 7 to 2 the Senate will pass it—and 100 to 1 we will regret it.

This declaration is more timely than ever; I am proud to reprint it—and deeply sorry that it was ever needed.

Any rational person may well disagree with me on details of this broadside. But on the moral principles expressed here, a free man says: "Give me liberty, or give me death!" No quibbling, no stopping to "think it over." He means it.

Fools and poltroons do not.

"Is life so dear, or peace so sweet, as to be purchased at the price of chains and slavery? Forbid it, Almighty God! I know not what course others may take, but as for me, give me liberty, or give me death!!"

—Patrick Henry

Last Saturday in this city appeared a full-page ad intended to scare us into demanding that the President stop our testing of nuclear weapons. This manifesto was a curious mixture of truth, half-truth, distortion, exaggeration, untruth, and Communist-line goals concealed in idealistic-sounding nonsense.

The instigators were seventy-odd local people and sixty-odd national names styling themselves "The National Committee for a Sane Nuclear Policy." It may well be that none of the persons whose names are used as the "National" committee are Communists and we have no reason to suppose that any of the local people are Communists—possibly all of them are loyal and merely misguided. But this manifesto is the rankest sort of Communist propaganda.

A tree is known by its fruit. The purpose of their manifesto is to entice or frighten you into signing a letter to President Eisenhower, one which demands that he take three actions. The first demand is the old, old Communist-line gimmick that nuclear weapons and their vehicles should be "considered apart" in disarmament talks. It has had a slight restyling for the post-Sputnik era and now reads: "That nuclear test explosions, missiles, and outer-space satellites be considered apart from other disarmament problems."

This proposal sounds reasonable but is booby-trapped with outright surrender of the free world to the Communist dictators. Mr. Truman knew it, Mr. Eisenhower knows it; both have refused it repeatedly. The gimmick is this: if nuclear weapons and their vehicles are outlawed while conventional weapons (tanks and planes and bayonets and rifles) are not, then—but you figure it out. 170,000,000 of us against 900,000,000 of them. Who wins?

Even if you count our allies (on the assumption that every last one of them will stick by us no matter how boneheaded our behavior), the ratio is still two-to-one against us when it comes to slugging it out with infantry divisions, Yalu River style.

Oh yes! Khrushchev would like very much to have nuclear weapons "considered apart" from infantry divisions. And he is delighted when softheaded Americans agree with him.

"The Mice Voted to Bell the Cat." —Aesop

Their second proposal has been part of the Communist line for twelve long years. It reads: "That all nuclear test explosions be stopped immediately and that the U.N. then proceed with the mechanics necessary for monitoring this cessation." This is the straight Communist gospel direct from the Kremlin. This was and is today their phony counterproposal to the Baruch Proposals of 1946—banning first, policing the ban if, when, and maybe . . . and subject to the veto of the U.S.S.R. It would leave us at the "mercy" of the butchers of Budapest, our lives staked on the "honor" of men to whom honesty is a bourgeois weakness, our freedom resting on the promises of a gangster government that has broken every promise it ever made.

The Committee's manifesto claims: "—the problems in monitoring such tests are relatively uncomplicated." This is either an outright lie or ignorant wishful thinking; the problems are so complicated that nothing short of on-the-spot inspection will work—an underground test cannot be told from an earthquake shock by any known method of monitoring.

Before you trust your lives and freedom to the promises of the Kremlin, remember Budapest—

—remember Poland in 1945
—remember Prague
—remember Estonia, Latvia, Lithuania

—remember Korea
—remember brave little Finland
—and keep your powder dry!

The third proposal is largely pious window-dressing but it has the same sort of boobytrap buried in it. It reads: "That missiles and outer-space satellites be brought under United Nations-monitored control, and that there be a pooling of world science for space exploration under the United Nations." The harmless part could be done if the U.S.S.R. were willing; the boobytrap is the word "missiles."

We Americans live in a goldfish bowl; we could not conceal rocket tests even if we tried. But in the vast spaces of Russia, Siberia, and China missiles of every sort—even the long-range ICBMs—can be tested in secret, manufactured and stockpiled and installed ready to go, despite all "monitoring." Anything less than on-the-spot inspection of the entire vast spaces of the Communist axis would leave us at the mercy of the bland promises of the Butchers of Budapest.

The last paragraph of this letter that they want you to send to the President is not a proposal; it is simply another attempt to strike terror into the hearts of free men by reminding us of the horrors of nuclear war.

" 'Will you walk into my parlor?' said the Spider to the Fly."

It is no accident that this manifesto follows the Communist line, no coincidence that it "happens" to appear all over the United States the very week that Khrushchev has announced smugly that the U.S.S.R. has ended their tests—and demands that we give up our coming, long-scheduled, and publicly announced tests of a weapon with minimum fallout.

This follows the pattern of a much-used and highly-refined Communist tactic: plan ahead to soften up the free world on some major point, package the propaganda to appeal to Americans with warm hearts and soft heads, time the release carefully, then let the suckers carry the ball while the known Communists stay under cover.

They used this method to gut our army after the Japanese surrender with the slogan of "Bring the Boys Home." They used it to make us feel guilty about the A-bomb—while their spies were stealing it. They dreamed up the pious theme of "Don't Play Politics with Hunger"—then used our charity to play their politics. They used it to put over the infamous "Oxford Oath" and the phony "Peace Strikes" of the thirties. They have used this tactic many times to soften up the free world and will use it whenever they can find dupes.

They are using it now. Today both sides, Freedom and Red Tyranny, are armed with nuclear weapons . . . and the Communists are again using our own people to try to shame or scare us into throwing our weapons away.

These proposals are not a road to world peace, they are abject surrender to tyranny. If we fall for them, then in weeks or months or a few years at most, Old Glory will be hauled down for the last time and the whole planet will be ruled by the Butchers of Budapest.

For more than a hundred years, ever since the original Communist Manifesto, it has been the unswerving aim of the Communist Party to take over all of this planet. The only thing blocking their conquest is the fact that the tragically-shrunken free world still possesses nuclear weapons. They can destroy us . . . but they know that we can destroy them.

So they want us to throw away the equalizer.

If we do, we can expect the same "mercy" that Budapest received. They will say to us: "Surrender—or be destroyed!"

"God grants liberty only to those who love it and are always ready to guard and defend it."
—Daniel Webster

We the undersigned are not a committee but simply two free citizens of these United States. We love life and we want peace . . . but not "peace at any price"—not the price of liberty!

Poltroons and pacifists will think otherwise.

Those who signed that manifesto have made their choice; consciously or unconsciously they prefer enslavement to death. Such is their right and we do not argue with them—we speak to you who are still free in your souls.

In a free country, political action can start anywhere. We read that insane manifesto of the so-called "Committee for a 'Sane' Nuclear Policy" and we despised it. So we are answering it ourselves—by our own free choice and spending only our own money.

We say to the commissars: "You will never enslave us. The worst you can do is kill us. But we are resolved to die free!"

"They that can give up essential liberty to obtain a little temporary safety deserve neither liberty nor safety."
—Benjamin Franklin

No scare talk of leukemia, mutation, or atomic holocaust will sway us. Is "fallout" dangerous? Of course it is! The risk to life and posterity has been willfully distorted by these Communist-line propagandists—but if it were a hundred times as great we still would choose it to the dead certainty of Communist enslavement. If atomic war comes, will it kill off the entire human race? Possibly—almost certainly so if the Masters of the Kremlin choose to use cobalt bombs on us. Their command of science in these matters seems equal to ours, they appear to be some years ahead of us in the art of rocketry; they almost certainly have the power to destroy the human race.

If it comes to atomic war, the best we can hope for is tens of millions of American dead—perhaps more than half our population wiped out in the first few minutes.

Colorado Springs is at least a secondary target; all of us here may be killed.

These are the risks. The alternative is surrender. We accept the risks.

"The liberties of our country, the freedom of our civil Constitution, are worth defending at all hazards."
—Samuel Adams

We have no easy solution to offer. The risks cannot be avoided other than by surrender; they can be reduced only by making the free world so strong that the evil pragmatists of Communism cannot afford to murder us. The price to us will be year after weary year of higher taxes, harder work, grim devotion . . . and perhaps, despite all this—death. But we shall die free!

To this we pledge our lives, our fortunes, and our sacred honor.

We the undersigned believe that almost all Americans agree with us. Whoever you are, wherever you are, you sons of Patrick Henry—let us know your name! Sign the letter herewith and mail it to us—we will see that it gets to Congressman Chenoweth, to both our Senators, and to the President.

1958 address— Robert and Virginia Heinlein

Colorado Springs, Colorado

1980 address— (Care Spectrum Literary Agency
60 East 42nd Street
New York City, New York 10017)

"WHAT CAN I DO?"

This much has been done by two people acting alone. Let's call ourselves "The Patrick Henry League" and prove to our government that the Spirit of '76 is still alive. We are two, you and your spouse make four, your neighbor and his wife make six—we can snowball this until it sweeps the country.

We can advertise in other counties, in other states.

If you who are reading this are not in Colorado Springs, stand up, speak up, and start your own chapter of "The Patrick Henry League" now. You are a free citizen, you need no permission, nor any charter from us. Run an ad—quote or copy this one if you like. Dig down in the sock to pay for it, or pass the hat, or both—but sound the call in your own home town, mail copies of your ad out of town, and get some more letters started toward Washington.

And let us hear from you!

Let us all stand up and shout aloud again and forever:

"Give Me Liberty or Give Me Death!"

President Eisenhower,
The White House
Washington, D.C.

Dear Mr. President:
We know that you are being pressured to stop our nuclear weapons tests, turn our missile and space program over to the U.N., and in other ways to weaken our defenses.
We urge you to stand steadfast.
We want America made supremely strong and we are resolved to accept all burdens necessary to that end. We ask for total effort—nuclear testing, research, and development, highest priorities for rocketry, sterner education, anything that is needed. We are ready to pay higher taxes, forego luxuries, work harder.
To this we pledge our lives, our fortunes, and our sacred honor.
Respectfully yours,

. . . .

INSIDE INTOURIST

How to Break Even (or Almost) in the Soviet Union

To enjoy a thing requires that it be approached in the proper mood. A woman who has been promised a luxury suite at Miami Beach won't cheer at the thought of roughing it in the north woods, especially if her husband pulls this switch after the vacation has started.

But, with proper preconditioning, it is possible to enjoy anything—some people are addicted to parachute jumping. To experience the Soviet Union without first getting in the mood for it is too much like parachute jumping when the chute fails to open. The proper mood for the Soviet Union is that of the man who hit himself on the head with a hammer because it felt so good when he stopped.

This article assumes that you have already, for good and sufficient reasons, decided to visit the USSR, one good and sufficient reason being a wish to see for yourself this Communist paradise that Khrushchev has promised our grandchildren. But to set out for Russia in the holiday spirit in which you head for the Riviera, Las Vegas, or Rio is like going to a funeral for the ride.

You can avoid the worst shocks to your nervous system by knowing in advance that you are not going to get what you have paid for; then you can soothe the residual nerve jangling with your favorite pacifier. I used small quantities of vodka—"small" by Russian standards, as Russians also use it to insulate themselves from the slings and arrows of outrageous fortune but they dose to unconsciousness. Drunks, passed out in public places, are more truly symbolic of the USSR than is the Hammer & Sickle.

My wife found methyl meprobamate (Equanil, Miltown) more useful. For you it might be yoga, or silent prayer, but, whatever it is, don't neglect it. Travel in the Soviet Union is not like travel anywhere else in the world. My wife and I have visited more than sixty countries on six continents, by freight ship, helicopter, dog sled, safari, jet plane, mule back, canal boat, etc.; as "seasoned travelers" these are our credentials. To visit the USSR we prepared by extensive reading and my wife learned the Russian language. Nevertheless, again and again we ran into surprises, difficulties, and maddening frustrations.

You can travel all through the Soviet Union without knowing a word of Russian—which will suit Khrushchev just fine because you will thereby be a prisoner of "Intourist," the state-owned travel bureau, seeing only what they want you to see, hearing only what they want you to hear.

But the Russian language is difficult; it took my wife two years of hard work to master it. The alphabet is weirdly strange, the pronunciation is hard for us, and the language is heavily inflected—a proper noun, such as "Smith" or "Khrushchev," has eighteen different forms.

Obviously most tourists can't take two years off to master Russian. What then? Depend entirely on Intourist guides?

No, no, no! Better to save your money and stay home. With no Russian at all you'll be as helpless as a bed patient. Instead you should prepare by learning a smattering of Russian. Forget about grammar; grammatical Russian is found only in formal literary compositions. Khrushchev has never learned to speak Russian well and Mikoyan speaks it with an accent thick enough to slice—so why should you worry?

First learn the alphabet, capitals and lower case, printed and written. This alone is half the battle. You can now find the men's room (or the ladies' room). The men's room is marked with "M" (for "muzhcheen," but think of "M" for "men") and the ladies' room is marked with a letter which looks like two capital K's, back to back: Æ. You are now past the greatest crisis confronting a traveler: finding the plumbing.

You now know many of the most useful Russian words just from knowing the alphabet. Hungry? Watch for a sign reading: "PECTOPAH." Sound it in your head as "restauran"—and it is!—the same word as in English save that the final "t" has been dropped.

There are hundreds of words which turn out to be the same as the English, or near enough. If you know French or German, your immediate vocabulary is further enriched, as, despite their boasts, Russian culture is very backward and most of their vocabulary for anything more complex than weeding a turnip patch has been borrowed from French, English, or German by converting the foreign word phonetically.

But don't stop with the alphabet; get a set of phonograph records for teaching Russian. Play them while following the lessons in the book—and play them without the book while bathing, shaving, cooking, gardening, *etc.* A few hours of this will pay off to the point where you will no longer be dependent on an Intourist guide; it will triple what you get out of a trip behind the Iron Curtain. For a few dollars in records and a little work you change it from a losing game into one in which your investment will be well repaid in education if not in pleasure.

But to get fun out of it, too, you must understand the Intourist game, play it, and win. Winning consists in outwitting the system so that you get more than they intend you to get; it does *not* mean fair value in the fashion (for example) that a traveler invariably gets his money's worth in any Scandinavian country. It is not possible to get fair value in the USSR; the game is rigged against the American tourist. But there are ways to minimize the expense and maximize the return while having quite a lot of fun.

All travel in the USSR is controlled at every point by Intourist; you must buy from it all travel, all automobile and guide service, all hotel rooms, all meals—or if you buy a meal not from Intourist you simply waste a meal already paid for.

You buy from Intourist at four rubles to the dollar—and you are licked from scratch as the value of the ruble is closer to forty to the dollar (which is the rate the Soviet government gives to favored visitors such as Asians they are trying to woo into the Communist camp).

You can cut costs by ordering cheap accommodations. Three grades are offered: Luxe, Tourist A, and Tourist B. A single man might risk Tourist B if he did not mind public toilets and baths of uncertain cleanliness, plus sharing sleeping space, dormitory style; a couple might risk Tourist A, which is supposed to be (but is not) equal to first-class travel elsewhere. But I cannot honestly urge anything short of "Luxe" class because even the best in Russia is often shockingly bad by our standards—bathrooms without baths, even hotels with no baths, tubs with no hot water, plumbing that is "quaint" or worse, poor cooking, dirty utensils, maddening waits. The lodging for Luxe class is often a huge and fantastically furnished suite, but a first-class double room & bath in any other country is more comfortable.

Luxe class costs $30 per day per person (3 Dec 79—Kremlin rate $182.40—World free-market rate $370.29) and includes lodging, meal coupons, and three hours of guide and automobile service per person (thus six hours for a couple)—if you get it. It does not include *any* train, plane, or bus fares. Add these in, plus round trip aircoach fares from New York, and a month in the Soviet Union will cost an American couple at least $4,500 (3 Dec 79—Kremlin rate $27,360.00 —World rate $55,543.50), plus spending money and extras.

You will get at least twice as much for your money in any other part of Europe, but the real problem always is to get what you have paid for and Intourist has contracted to furnish you.

Start by realizing that Intourist is not really a travel service in the sense in which Thos. Cook or American Express is. It is a bureau of the Communist government and its function is to get those Yankee dollars in advance, channel you through a fixed route, then spill you out at the far end almost as ignorant of their country as when you started. P. T. Barnum's famous sign "*This Way to the Egress*" anticipated the basic Intourist principle: Get the sucker's money first, then get rid of him with the least trouble to the management.

So treat it as a game and don't fret when you lose. Try to get a good night's sleep—the bed may be awful but it will be quiet because there is almost no traffic—and try again the next day.

For example: the guide is not there to guide you, the guide is there to make sure that you see the stadium—so try not to see a stadium anywhere in the Soviet Union. Surely they have stadiums; any people so devoted to "Togetherness" have stadiums—how else could they display ten thousand people all doing physical jerks at once? (A "Spartakiad") But remember that your fixed cost is about $20 just to look at a stadium (with no football game thrown in) and that, in diverting you to the stadium, Intourist has kept you from seeing something of real interest, a factory, a slum area, or a school.

Stadiums haven't changed much since the Romans built the Colosseum; if you have seen Yankee Stadium, Soldiers' Field, or the Rose Bowl—or even the football stands of Podunk High—you've seen enough empty stadiums to last a lifetime. So refuse!

But the guide has orders that you *must* see the stadium; no other theory will account for the persistence with which all Intourist guides *insist* that you see the local stadium. If you manage to get in and out of the Soviet Union without visiting a stadium, award yourself the Order of Hero of Soviet Travel, First Class.

(We saw a lot of them—nobody had warned us.)

Each Intourist hotel has a place called the "Service Bureau." "Service" in this usage is an example of Communist semantics comparable to "coexistence," "peaceloving," "democratic," *etc.* Here most of your battles with Intourist will take place. Second only to the passed-out drunk, the most typical sight in the Soviet Union is an American tourist seated in a service bureau, his expression getting tighter as the weary, expensive minutes trickle away.

Intourist rarely uses the blunt refusal on this unhappy creature; instead the standard tactics are please-sit-down-and-wait-for-just-a-moment (which usually turns out to be at least an hour), I'm-sorry-but-the-Directoris-out (and won't return as long as *you* keep hanging around), comeback-later (when the desk will be closed), and go-to-that-desk-at-the-far-end-of-the-room (where, after more delay and much consultation, you will be sent back to the desk from which you started).

When facing this, to get part of what you have paid for (and anything over 70% is a triumph, with 50% par for the course) you must stick to pre-planned defensive tactics and never, never, never lose your temper, or you will wind up a fit candidate for wet packs and sedation.

Their first weapon is politeness. You *must* resist this soporific politeness or you will not get anything.

First-Stage Defense: Be just as polite as they are—but utterly stubborn. Above all, *don't sit down when invited to.* If you do, this retires you from the game for an indefinite penalty period. Hold your ground, standing firmly against the desk and taking up as much space as possible—lean on it with hands spread wide to double your combat frontage. Say firmly and politely: "No, thank you, I'll wait right here"—then monopolize that desk and clerk, making it impossible for business to be transacted until Intourist has honored your contract on the point you have raised.

Keep talking. It does not matter what you say nor whether the clerk understands English—*keep talking!* Your purpose is to take that unit of Intourist out of the game until your request has been met, not with promises but with immediate action—whereas *their* purpose is to get *you* out of the game by persuading you to sit down away from the desk.

So hold your ground and be softly, politely stubborn. Usually someone with authority will arrive in a few minutes and satisfy your request.

Defense in Depth: Be prepared to simulate anger at any instant. It is much better to *pretend* to lose your temper *before* things have grown so unbearable that you actually do blow your top; it saves wear and tear on your ulcers and enables you to conduct your tactics more efficiently.

(And I must say a word on behalf of Intourist employees. About three quarters of them are young women, girls really. They are nice people, polite, harassed, overworked, and underpaid. They are prisoners of a system which automatically frustrates the traveler, and they are more imprisoned by it than you are, for you will escape (we hope) on the date set forth on your exit visa. They can't. These poor kids did not invent the silly red tape and mountains of useless paperwork and those in the lower ranks have no authority to vary from it. So don't be too harsh and try not to lose your temper in fact.)

But be prepared to simulate anger whenever the log jam does not break under the pianissimo tactics of the first-stage defense. When you refuse to sit down and wait, the clerk will sometimes turn away and ignore you.

It is then time to throw a fit.

You must (1) hold your blocking position, (2) make lots of noise, and (3) show that you are bitterly and righteously angry and cannot possibly be shut up short of complete satisfaction.

Keep shouting. It helps to cuss a bit and one all-purpose word will do: "*Bor*jemoi!" This is a phonetic approximation of two words meaning "My God!"—which is merely an expression of disgust in this atheistic society. Another good phrase is "Yah Haw*chew*!" which is the abrupt way of saying "I want it!" (The polite idiom is "Mnyeh

*Khaw*chettsuh.")

You can shout, "I want to see the Director!"—or, in Russian, "Yah *Khaw*chew veedyets Direktora!" She may possibly answer, "The Director's office (or desk) is over there," but she is more likely to give you what you want rather than let you complain to the boss.

But if she does, *don't move.* Hold your ground, keep on being unreasonable, and let the boss come to you. If you let them chivvy you into his office, away from spectators, and you yourself sitting down and being polite, you've lost that round. The Director will be polite, apologetic, and regretful about "shortages"—but firmly unhelpful. The place to win is in public.

For most of us it is not easy to be intentionally rude. I think one should never be impolite unnecessarily—but we can do much to uphold our national dignity and to improve our relations with the Soviet Union by never keeping quiet when we are cheated, by answering the great stubbornness of Russians by being twice as stubborn, and by being intentionally and loudly rude whenever Intourist refuses to keep its contract despite polite protest. Intourist is an integral part of a government with a forty-three year record (now 63 years—R.A.H.) of not honoring its most solemn commitments; one must assume that its blatant cheating is planned from the top and that every employee of Intourist is schooled in his role, right down to the sweet little girl who insists that you must see the stadium.

You may prefer to think that this horrendous swindle is merely an unintentional byproduct of a fantastic, all embracing, and incredibly inefficient bureaucracy bogged down in its own red tape to the point where it can't give service. Either way, a contract with Intourist works exactly like that long list of broken treaties. You start by making a contract with the Soviet government; you are required to pay in advance and in full. Then you attempt to collect what you have paid for—and discover that a Communist contract is worth what it usually is. "Room with bath" turns out to be without, "jet planes" become prop planes, guide and auto service is less than half the time you have paid for, dining rooms are locked at meal hours, and your extremely expensive time is wasted sitting, sitting, sitting in "service" bureaus.

Unless you raise hell about it, right at the time. No use complaining later, you won't get your money back.

If neither polite stubbornness nor noisy rudeness will work, use the insult direct. Shake your finger in the face of the most senior official present, simulate extreme rage, and shout, "Nyeh Kuhl-*toor*nee!" ("Uncultured!") Hit that middle syllable and roll the r's.

Subordinates will turn a sickly green and pretend to be elsewhere. The official will come close to apoplexy—but will probably make an extreme effort to satisfy your demand in order to shut you up. This is the worst insult you can hand a Russian, one that hits him in cracks of his armor. *Use it only as a last resort.*

I do not think you will be in personal danger as the officials you will meet will probably not be high enough in the hierarchy to punish you for insulting them. But if anything goes wrong and you wind up in Siberia, *please understand that you use it at your own risk.*

If "nyeh kuhltoornee" does not work, I have nothing more to suggest but a hot bath and a sedative.

But the above campaign usually wins in the first or second stage and rarely fails in the third as it is based on Russian temperament and Communist social organization. Even the most arrogant Soviet citizen suffers from an inferiority complex when faced with free citizens of the western world, especially Americans. The questions they ask most frequently are: How much money do you make? How big is your house? Do you own an automobile? Each one is a dead giveaway.

So if you make it clear that Intourist service is contemptible by free-world standards, a Russian may want to take a poke at you but he is much more likely to attempt to restore face by meeting those standards. The rest of the picture has to do with socialist "equality," another example of Communist semantics, because in the egalitarian paradise there is *no* equality, nowhere anything like the easygoing equality between an American taxi driver and his fare. In the USSR you are either on top or underneath—never even.

An American does not fit. Some Soviet citizens react by subordinating themselves to the tourist; grandmothers sweeping the streets will scurry out of your way, taxi drivers will rush to open doors, porters and waitresses and such are servile in a fashion we are not used to. But an employee of Intourist is in an indeterminate position vis-à-vis a tourist. Dominant? Or subordinate? It must be one or the other. Often there is a quick test of wills, then an immediate assumption of one role or the other depending on how the tourist responds. For example, we were met in Kiev by a guide who gave his name as "Sasha." I asked his surname; he told me quite arrogantly that there was no need for me to know it.

We had been in the USSR several weeks and I had had my fill of arrogance; I told him bluntly that I was not interested in his name, that I had asked out of politeness as practiced in all *civilized* countries —but that if good manners were not customary in his country, forget it!

An American or other free man might have given me a rough answer or icy silence; he did neither, he groveled. When he left us at the hotel he thanked us effusively for having been so kind as to talk with him. His manner was cringingly servile.

I don't like servility any more than the next American—but if there is going to be any groveling done it won't be by me. Nor, I hope, by you. In dealing with Intourist people you will often run into situations where one of you must knuckle under—and many are much tougher cases than this man. It will be a clash of will and all too often polite stubbornness won't be enough to get them to honor your contract—then you need to model your behavior after the worst temper tantrums you have seen Khrushchev pull on television; this they understand. In the USSR only a boss ever behaves that way; therefore you *must* be entitled to Red Carpet service. The Intourist functionary *knows* you are just an American tourist, to be frustrated and cheated, but his conditioned reflex bypasses his brain; a lifetime of conditioning tells him to kowtow to any member of the master class . . . which you *must* be, even though his brain tells him you are not.

It usually works. In a bully-boy society often nothing but bullying will work.

The "Coupon Game": When you arrive you will be handed a lot of documents in exchange for your tour voucher; one will be a book of meal tickets, four coupons for each day. For Luxe class their values are twelve rubles for a breakfast coupon, twenty for a lunch, three for tea, thirty for dinner. If you and your spouse have contracted to spend a month in the USSR, your meal tickets have cost you one thousand dollars (3 Dec 79—Kremlin rate $6,080.00—World free-market $12,343.00) *(*28½ oz. of gold). The gouging starts here, because Diamond Jim Brady and his twin could not eat a thousand dollars of Intourist food in a month. Intourist eateries range from passable to very bad. Hotel Berlin in Moscow is perhaps the best but even it would have trouble making the Duncan Hines list. There are three or four good restaurants in the Soviet Union but their prices are *very* high and they won't accept coupons.

You can minimize your losses in ways that Intourist does not tell you. You can combine coupons as you wish—a "lunch" and a "breakfast" to pay for dinner, for example. The possible combinations in rubles are 3, 6, 9, 12, 15, 18, 20, 21, 23, 24, 26, 27, 29, 30, 32, 33, 35, 36, 38, and all higher numbers—but the hitch is that too many of them take more than one "tea" coupon. So figure out the best way to work each combination and write it on the back of your coupon book; this will help you to decide whether to overpay for food already horribly overpriced, or to pay the difference in cash. Skill in the coupon game can save you many, many dollars.

There is nothing fair in the coupon system but it isn't meant to be; it is the prime fashion in which the Soviet government squeezes more dollars out of American tourists than they want or need to spend.

There are other ways to reduce your losses. You can swap coupons for liquor, candy, canned caviar, cigarettes, and bottled water. Tap water in Moscow and Leningrad is said to be safe but elsewhere it is wise to buy mineral water—get enough bottles at a time to come out even in coupons. Their cigarettes are corrosive but a brand called "Trud" is smokable. Candy is extremely expensive but a welcome change in a tedious diet (I lost twelve pounds); caviar is cheap and is the best buy to use up leftover coupons on your last day. Don't expect to find whiskey nor any imported liquor, but local "kawnyahk" and "chahm*pahn*skoyeh" are good. The vodka like ours is "*vawt*-kah stel*leech*nayuh"—the other sorts are very highly spiced. Their wines are good.

My favorite relief from a hard day with Intourist was a Bloody Mary—"Staw grahm vawt-kee, p'jalst, ee taw*maht*nee sawk." This is "nyeh kuhltoornee" as the proper way to drink vodka is with beer (*pee*vaw), or with black bread, sweet butter, and caviar.

In Moscow and Leningrad very few Russian waiters speak English and almost none elsewhere, but you will usually be handed a huge four-language menu on which you can pick out what you want in English and point to it in Russian. But only the few items with prices written in are offered and maybe half of those will be available—when the waiter says "Nyeh-taw" he means it's all gone. Allow at least two hours for dinner; I've never heard of any way to speed up the service. But, once you are served, the waiter may try to rush you out, claiming that the table is reserved ten minutes hence for a delegation or such. He may simply want to sell food to someone else—he gets a commission. Ignore him—you've waited a long time, paid a high price in advance, and are entitled to eat in peace.

Pick a table as far from the orchestra as possible. Some orchestras are good but most are very loud and sound like a fully automated boiler factory.

Tipping is never necessary but waiters, chambermaids, and porters are paid very little. Tips can be coupons or cash.

The dining room is often locked—for a political delegation from Asia or Africa, for a traveling theatrical troupe, or anything. Any service may be chopped off without warning in any Intourist hotel. Complain . . . but be prepared to fall back on the buffet (pronounced "*boof*-yet"). There are usually three or four on the upper floors of large hotels, open from seven a.m. to eleven at night and serving omelets, snacks, beer, wine, juice, coffee, tea, cakes, *etc.* The guides and clerks in Intourist often do not know about them because *they have never been upstairs,* so watch for the sign (ÁÓÔÅÒ) or wander the corridors saying inquiringly to maids and floor clerks: "*Boof*-yet?"

Buffets are cozy, friendly, little places run by cheerful, helpful, dreadfully overworked women. They won't know English and the menu will be in Russian—here a memorandum in English & Russian of your favorite foods is most useful. But even the buffet doesn't serve breakfast before seven and Russian transportation often leaves at such an hour that you must leave the hotel before then. Russian hotels have room service but not at such hours. If you have your *own* thermos bottle, room service can fetch you hot coffee and a cold breakfast the night before. (They've heard of thermos bottles—the word is the same —but the hotel won't have one.)

Keep iron rations in your room and carry food and drink on long flights and train trips. Both trains and planes often stop for meals but you can't count on it and usually can't find out in advance.

Minor Ways to Improve Your Score: Go for walks without your guide; you will usually be picked up by someone who knows English —but you will *never* be picked up while a guide is with you. This is your chance to get acquainted and to get answers which are not the official answers. Don't talk politics—but these venturesome souls may ask you political questions and you can learn almost as much by the questions they ask as by raising such issues yourself.

Your guide may not be a hardshell Communist; he, or she, may open up once he thinks he can trust you. If so, be careful not to mention anything even faintly political when others are in earshot, *especially the driver.* The driver may be a political chaperone who knows English but pretends not to. More than one guide has told me this and *all* guides talk more freely when no one can overhear.

In this country children are brought to Moscow and decorated for having informed on their *parents. Never forget this.*

When you are shown a party headquarters, a palace of culture, a stadium, an auditorium, or such, ask when it was built. We discovered that, in the areas not occupied by Nazis, many of the biggest and fanciest were built right at the time Americans were dying to keep the Murmansk lend-lease route open.

There is new brick construction all over the Soviet Union. We asked repeatedly to be shown a brick yard, were never quite refused, but the request was never granted. We have since heard a rumor that this is prison labor and that is why a tourist can't see something as unsecret as a brick yard. So try it yourself—you may merely prove to yourself that Intourist exists to keep tourists from seeing what they want to see, rather than vice versa.

Offer your passport to casual acquaintances; they will usually offer theirs in return—*internal* passports. Intourist people have been coached to deny that such a thing exists but everybody in the USSR carries one and the owner must get a visa to go from one Russian city to another. It is a brown book with "ÏACÏOPT" (passport) on the cover. Try it when your guide is not around.

The USSR is the only country in which we were never able to get into a private home. Other tourists report the same but one couple from Los Angeles almost cracked this; they said to their guide, "*Why* can't we see the inside of one of those apartment houses? Are you people *ashamed* of them?" The next day they were shown through a not-yet-occupied one.

This could be varied endlessly, as it works on that Russian basic, their inferiority complex. The key word is "ashamed"—simply asking "Why?" gets you nowhere. I think it could be used to get into farms, schools, courts, factories, anything not a military secret. It tops my list of things I wish I had thought of first.

In meeting anyone, including guides, try to use "democracies" as an antonym for "Communist countries" as soon as possible—drag it in by the heels, i.e., "I think all of us from the democracies earnestly hope for peace with the Communist countries," *etc.* The much abused word "democratic" means "Communist" in Russia and it always introduces a propaganda pitch. If you deny him his definition by preempting the word, you leave him with his mouth hanging open, unable to proceed.

We got tripped on this several times before we caught on.

The official list of things you must not photograph is short but the unofficial list is long and ranges from old, broken-down buildings to old, broken-down women sweeping the streets. You can photograph such by having them appear "accidentally" in a background but if you are suspected of this, they have a silent counter to it. At some later time you will find that your film has been exposed to light, then respooled. You could keep all your film with you at all times and hope to get it across the border . . . but such behavior might cause you to be arrested on suspicion of espionage, as one American tourist was this summer. At best, sneaking a picture of one passed-out drunk risks losing *all* your pictures—too high a price even if you aren't accused of being a spy.

The most-used plane, the Ilyushin-14, flies very low; you can see a lot and compare it with elsewhere. Are railroads single or double track? How much traffic on the roads? On the rivers? How about factory smokestacks and other signs of industry? How busy are the airfields? Or a dozen other things. I think you will conclude that no Russian claim should be accepted as true until fully verified. A "great industrial center" often turns out to be a jerkwater town.

But don't make written notes about such things! *Don't!!!*

Will your mail be opened? You must assume so. Will your rooms be bugged? It seems impossible to monitor every room of every Intourist hotel—but if the police get interested in *you* it takes just three minutes in these days of miniaturization to bug a room. I do know, from several incidents, that Soviet citizens *believe* that all hotel rooms are bugged.

I wish that a million of us would visit the USSR; the dollars the Kremlin would reap would be more than offset by the profit to us in having so many free men see with their own eyes what Communism is.

But go there with your eyes open—Intourist is as fully an agency of the Kremlin as is Gromyko or Mikoyan. Its functions are (1) to get your money in advance, (2) to deliver as little as possible by downgrading accommodations, by forced overcharges on food, and by clipping you on auto and guide service, (3) to waste your time so that you will see as little as possible, and (4) to see that what little time you have left is spent only on those things the Kremlin does not mind your seeing—"new construction" (from the outside), parks of "rest & culture" (filled with loudspeakers blaring propaganda), ballets, museums, stadiums, and the outsides of public buildings.

The first point you must accept; the game is crooked but it is the only game in town. Points two and three you can struggle against—I hope the tactics suggested in here will help. Point four is the toughest. After trimming you down to about three hours a day of useful time, Intourist can and will use up what is left in "stadium sightseeing" unless you fight it constantly. Even then, Intourist is adept in parrying with: "It's closed today—too bad you're not staying another day," and "That must be arranged in advance through the Ministry of Culture, etc." and "You should have requested that in Moscow."

The essence of Intourist tactics is: "Jam yesterday and jam tomorrow, but never jam today." The way to answer it is: "No! I will *not* look at the stadium, I do *not* want to see another subway station, I will *not* visit a museum to see another five hundred pictures of Lenin. I want to see thus-and-so and I want to see it *now.* Stop the car, get on the phone, and arrange it—or tell the Director that, as far as I am concerned, you're fired! I am keeping the car and the driver and will go on without you—I've got hours more of car service due me today and I *won't* be cheated out of it." You will find whether your guide is truly a guide . . . or a guard placed with you to make sure you see only the facade of this regime. Whether or not you see "thus-and-so" you are sure to learn a surprising amount about how a police state is run . . . and thereby get your full money's worth in education.

"PRAVDA" Means "TRUTH"

"Pravda" means "truth."

That's what it says, right here in my English-Russian dictionary: Pravda—Truth. Surely one may depend on the dictionary.

In Al Smith's bleak, skeptical words: "Let's take a look at the record."

On May Day, 1960, a United States U-2 reconnaissance plane made some type of unplanned landing in the Soviet Union. This much is both "truth" and "pravda." Beyond this bare fact, "truth" and "pravda" diverge widely.

TRUTH: On May 1 this U-2 plane grounded near Sverdlovsk in the heartland of the Soviet Union about 1,500 miles from the border it crossed. The plane was wrecked but the pilot was not killed. Much of the equipment in the plane, such as radio gear, was undamaged. The pilot's survival and the condition of the wreckage, plus the undamaged equipment, suggest a forced landing in rough country, such as would result from engine failure.

The U-2 is extremely fast and it cruises at very high altitude, 60–70,000 feet. The kinetic energy stored in a moving object varies as the square of its velocity ($E = \frac{1}{2}MV^2$). A staggering amount of kinetic energy is stored in a U-2. If such a plane is hit by antiaircraft rocket fire what happens in the next split second would make a head-on collision between two hot-rodders seem like a mother's loving pat. The antiaircraft damage merely triggers the disaster; the major violence comes from the plane's great speed—it explodes! Suddenly the sky is filled with junk.

The chance of the pilot's surviving is small. He may escape if the plane's ejection capsule is not damaged when the plane is hit. But there is only the tiniest chance that radios and other relatively fragile pieces of equipment would reach the ground undamaged. Nevertheless, such items were "recovered" from the "shot-down" U-2. A crate of eggs, uncracked, would be equally convincing.

We may never know the exact truth of what happened to that U-2. Only Soviet officials talked to unlucky pilot Powers before his trial.

But the nervous nellies among us should stop beating their breasts over the shame of it all. Photo reconnaissance is not the same thing as a bombing run. An overflight by an unarmed plane is not in the same league with what Khrushchev did to Budapest. What we are dealing with here is the security of the United States and—very possibly—the survival, and certainly the freedom, of the entire human race.

Espionage is not illegal under International Law. Neither is it immoral. The penalty for getting caught at it is very high. It usually means the spy's neck. It is not illegal under U.S. laws for us to attempt to spy on the USSR, nor is it illegal under Soviet law for them to attempt to spy on us. Nor, in either case, is it an act of war. Throughout history every country has striven to learn the military secrets of any potential enemy, and to protect its own. Spying is wise and necessary insurance against utter military disaster.

That we have been conducting photo reconnaissance over the Soviet Union so successfully and for four vital years is the most encouraging news in the past decade. Among other things it means we have accurate maps by which to strike back. The Soviet Union does not have to send spy planes over us to obtain similar information. Excellent large-scale maps with our military installations and industrial complexes clearly marked may be obtained free from Standard Oil or Conoco. Still better maps may be ordered by the Soviet Embassy from our Coast and Geodetic Survey at very low prices. Soviet agents move freely among us and many of them enjoy the immunity and complete freedom of travel afforded by U.N. passports. If a Red spy wants aerial color photographs at low altitude of our Air Defense installation just south of Kansas City—in America's heartland—until recently he could hire a pilot and a plane at the Kansas City airport for about $25 an hour and snap pictures to his heart's content without taking any of the risks of being hanged or shot down that Francis Powers took for us. If Mr. Eisenhower had failed to obtain by any possible means the military intelligence that the USSR gets so easily and cheaply about us, he would have been derelict in his duty.

So, if you hear anyone whining about how "shameful" the U-2 flights were, take his lollipop away and spank him with it.

PRAVDA: It took the fat boy with the bad manners five days to decide just what sort of "pravda" to feed his people. The situation must have been acutely embarrassing for him, much more so than it was to us, because for four years he had been totally unable to stop the flights, despite his boasts and missile brandishing, despite the fact that every flight was certainly observed in Soviet radar screens.

K. could keep quiet, in which case there was little chance that the Free World news services would ever learn about it, and no chance that the Russian people would ever find out. Our Central Intelligence Agency would know that a reconnaissance plane was missing, but it would not have advertised a top secret.

K. could refurbish the incident, give it a new paint job and peddle it as propaganda.

Or K. could tell the simple truth. This alternative is mentioned simply to keep the record technically complete, as the simple truth is a tactic not contemplated under Marxism-Leninism doctrines. Here we have the essential distinction between truth and pravda.

Truth, to the West, consists of all the facts without distortion.

Pravda is that which serves the World Communist Revolution. Pravda can be a mixture of fact and falsehood, or a flatfooted, brassbound, outright lie. In rare cases and by sheer coincidence, pravda may happen to match the facts. I do not actually know of such a case but it seems statistically likely that such matching must have taken place a few times in the past 43 years.

This comparison is not mere cynicism. I appeal to the authority of V. I. Lenin himself, in his tactics of revolution. By the doctrines of dialectical materialism, simple truth as we know it is abolished as a concept. It can have no existence of its own separate from the needs and purposes of the Communist Party and the World Revolution. Our ingrained habit of believing that the other fellow must be telling the truth at least most of the time is perhaps our greatest weakness in dealing with the Kremlin.

Apparently K. and his cohorts encountered much trouble in deciding just what the pravda should be about the U-2. They spent almost a week making up their minds. I was in Moscow at the time and there was no indication of any sort that anything unusual had happened on May 1. Russians continued to treat us American visitors with their customary almost saccharine politeness and the daily paper (I hesitate to call it a newspaper) known as *Pravda* hinted not of U-2's. This situation continued for several days thereafter. I was not dependent on an Intourist guide-interpreter in reaching this impression as my wife reads, writes, understands and fluently speaks Russian. She's not of Russian descent. She learned it at a University of Colorado Extension night school, plus a private tutor and a lot of hard work.

After May Day, we went on out to Alma Ata in Kazakhstan, north of India and a very short distance from the Red China border, about 2,000 miles beyond Moscow. Be-Kind-To-Americans Week continued. Three Americans, the only travelers in that remote part of Asia, received the undivided attention of the Alma Ata Director of Intourist, two school teachers (pulled off their teaching jobs to act as guides), two chauffeurs, and most of the attention of the hotel staff. We had but to express a wish and it was granted.

As of Thursday morning, May 5, the pravda was still that nothing had happened.

Thursday afternoon the climate abruptly changed. K's cohorts had at last decided on a pravda; to wit: an American military plane had attempted to cross the border of the Soviet Union. Soviet rocket fire had shot it down from an altitude of 60,000 feet as soon as it had crossed the border. The Soviet peoples were very much distressed that America would even attempt such an act of bald aggression. The Soviet peoples wanted peace. Such aggression would not be tolerated. Any other such planes would not only be shot down but the bases from which the attacks were made would be destroyed. Such was K's new pravda at the end of a five-hour speech.

The only connection between pravda and fact lay in the existence of an American plane down on Soviet soil. The locale of the incident shifted 1,500 miles. The plane is "shot down" at an extremely high altitude (if true then those exhibits in Gorky Park were as phony as K's promises of safety to Nagy and Pal Maleter). No mention at all is made of four long years of humiliating defeat. Pravda suppresses the truth and turns the incident into a triumph of Soviet arms. The Soviet newspapers and radio stations, all state-owned, spout the same line. All during this period the Voice of America was jammed. K. made certain his serfs heard nothing but the pravda.

We learned it by being ordered—not requested—to report to the Alma Ata office of the Director of Intourist. There we were given a long, very stern, but fatherly, lecture on the aggressive misbehavior of our government, a lecture that included a careful recital of the U-2 pravda.

Once I understood, I did something no American should ever do in the Soviet Union. I lost my temper completely. I outshouted the director on the subject of American grievances against the Soviet Union. My redheaded wife most ably supported me by scorching him about Soviet slave labor camps, naming each one by name, pointing out their location to him on the big map of the Soviet Union which hung back of his desk, and telling him how many people had died in them—including Americans.

We stomped out of his office, went to our room and gave way to the shakes. I had lost my temper and with it my judgment and thereby endangered not merely myself but my wife. I had forgotten that I was not protected by our Bill of Rights, that I was not free to bawl out a public official with impunity—that I was more than 2,000 miles from any possible help.

Communism has no concern for the individual. The Soviets have liquidated some 20 to 30 millions of their own in "building socialism." They kept after Trotsky until they got him. They murdered a schoolmate of mine between stations on a train in Western Europe and dumped his body. Terror and death are as fixed a part of their tactics as is distortion of the truth. Their present gang boss is the "liberator" of Budapest, the "pacifier" of the Ukraine—a comic butcher personally responsible for the deaths of millions of innocent people.

All this I knew. I knew, too, that our own policies had softened beyond recognition since the day when Teddy Roosevelt demanded the return of an American citizen alive—or the man who grabbed him, dead—and made his threat stick. In these present sorry days no American citizen abroad can count on protection from our State Department. We have even voluntarily surrendered our own soldiers' Constitutional rights, drafted and sent willy-nilly to foreign lands. We still permit the Red Chinese to hold prisoner hundreds of our boys captured nearly ten years ago in Korea. We do nothing about it. I did have the cold comfort of knowing that I had behaved as a free man, an American. I cherished the thought. But I could not honestly pat myself on the back. My anger had been a reflex, not courage. Pride would not be much to chew on if it had got my wife and myself into a Soviet slave labor camp.

I began to listen for that knock on the door, the one you read about in *Darkness at Noon,* the knock that means your next address may be Vorkuta or Karaganda. The address doesn't matter. You are never, never going to receive mail.

My fears were not groundless. I'd read Philip Wylie's *The Innocent Ambassadors* and I knew what had happened to his brother. I vividly recalled Kravchenko's *I Chose Freedom.*

The knock never came because the political climate engendered by the new pravda was "more-in-sorrow-than-in-anger." The next morning, May 6, we were again ordered to report to the Director's office. We had decided to brazen it out. We refused to go. Presently, we were allowed to catch a plane for Tashkent.

Pravda lasted 12 days, until K. shattered the Summit and revealed a new pravda.

We arrived in Leningrad just as the news reached there that the Summit had failed and that President Eisenhower had cancelled his proposed trip to the USSR and that Khrushchev was returning to Moscow via East Berlin.

The climate suddenly turned very chilly.

A month earlier, in Moscow, we had been picked up by two Russians the very first time we went out on the street. One was a technical translator; the other, a lady, was a museum curator. They were very friendly and stayed with us almost three hours, asking questions about the U.S. and inviting questions about the Soviet Union. This happened to us daily thereafter; we were always making casual acquaintance with Soviet citizens, on the street, in parks, in restaurants, during intermissions at the theatre, everywhere. They were always curious about America, very friendly and extremely polite. This attitude on the part of individual Soviet citizens toward individual Americans continued throughout the first pravda, ending May 6. It lessened slightly during the "more-in-sorrow" second pravda.

K's Paris news conference set up a new pravda. From the time we reached Leningrad until we left for Helsinki, Finland, not one Soviet citizen other than Intourist employees—who had to deal with us professionally—spoke to us under any circumstances. Not one.

In dealing with Intourist it is always difficult to tell whether one's frustrations arise from horrendous red tape or from intentional obstructionism. In Leningrad it at once became clear that Intourist now just did not want to give service. Even the porter who took up our bags made trouble.

Our first afternoon we were scheduled to visit the Hermitage, one of the world's great art museums. The tour had been set with Intourist for that particular afternoon before we left the States.

At the appointed time our guide (you have to have one) had not arranged for a car. After awhile it whisked up and the guide said, "Now we will visit the stadium."

We said that we wanted to visit the Hermitage, as scheduled. The guide told us that the Hermitage was closed. We asked to be taken to another museum (Leningrad has many). We explained that we were not interested in seeing another stadium.

We visited the stadium.

That is all Intourist permitted us to see that afternoon.

When we got back to the hotel we found someone in our room, as always in Leningrad. Since maid service in Intourist hotels varies from nonexistent to very ubiquitous we did not at once conclude that we were being intentionally inconvenienced. But one afternoon we found six men in our room, busy tearing out all the pipes and the question of intent became academic. A hotel room with its plumbing torn up and its floor littered with pipes and bits of wood and plaster is only slightly better than no hotel room at all.

We went to the ballet once in Leningrad. Intermissions are very long in Soviet theatres, about half an hour, and on earlier occasions these had been our most fruitful opportunity for meeting Russians.

Not now, not after K's Paris pravda. No one spoke to us. No Russian would even meet our eyes as we strolled past. The only personal attention we received that evening at the ballet was an unmistakably intentional elbow jab in the ribs from a Russian major in uniform. Be-Kind-To-Americans Week had adjourned, sine die.

How can the attitudes of 200 million people be switched on and off like a light bulb? How can one set of facts be made to produce three widely differing pravdas? By complete control of all communications from the cradle to the grave.

Almost all Soviet women work. Their babies are placed in kindergartens at an average age of 57 days, so we were told, and what we saw supported the allegation. We visited several kindergartens, on collective farms and in factories. By the posted schedules, these babies spend 13½ hours each day in kindergarten—they are with their mothers for perhaps an hour before bedtime.

At the Forty-Years-of-October Collective Farm outside Alma Ata some of the older children in one of the kindergartens put on a little show for us. One little girl recited a poem. A little boy gave a prose recitation. The entire group sang. The children were clean and neat, healthy and happy. Our guide translated nothing so, superficially, it was the sort of beguiling performance one sees any day in any American kindergarten.

However, my wife understands Russian:

The poem recounted the life of Lenin.

The prose recitation concerned the Seven-Year Plan.

The group singing was about how "we must protect our Revolution."

These tots were no older than six.

That is how it is done. Starting at the cradle, never let them hear anything but the official version. Thus "pravda" becomes "truth" to the Russian children.

What does this sort of training mean to a person when he is old enough, presumably, to think for himself? We were waiting in the Kiev airport, May 14. The weather was foul, planes were late and some 30 foreigners were in the Intourist waiting room. One of them asked where we were going and my wife answered that we were flying to Vilno.

Vilno? Where is that? My wife answered that it was the capital of Lithuania, one of the formerly independent Baltic republics which the USSR took over 20 years ago—a simple historic truth, as indisputable as the fact of the Invasion of Normandy or the bombing of Pearl Harbor.

But the truth is not pravda.

A young Intourist guide present understood English, and she immediately interrupted my wife, flatly contradicted her and asserted that Lithuania had *always* been part of the Soviet Union.

The only result was noise and anger. There was no possibility of changing this young woman's belief. She was telling the pravda the way she had been taught it in school and that was that. She had probably been about three when this international rape occurred. She had no personal memory of the period. She had never been to Vilno, although it is less than 400 miles from Kiev. (Soviet people do not travel much. With few exceptions the roads are terrible and the railroads are scarce. Russians are required to use internal passports, secure internal visas for each city they visit and travel by Intourist, just like a foreigner. Thus, traveling for pleasure, other than to designated vacation spots on the Black Sea, is almost unheard of.)

In disputing the official pravda we were simply malicious liars and she made it clear that she so considered us.

About noon on Sunday, May 15, we were walking downhill through the park surrounding the castle that dominates Vilno. We encountered a group of six or eight Red Army cadets. Foreigners are a great curiosity in Vilno. Almost no tourists go there. So they stopped and we chatted, myself through our guide and my wife directly, in Russian.

Shortly one of the cadets asked us what we thought of their new manned rocket. We answered that we had had no news lately—what was it and when did it happen? He told us, with the other cadets listening and agreeing, that the rocket had gone up that very day, and at that very moment a Russian astronaut was in orbit around the earth—and what did we think of that?

I congratulated them on this wondrous achievement but, privately, felt a dull sickness. The Soviet Union had beaten us to the punch again. But later that day our guide looked us up and carefully corrected the story: The cadet had been mistaken, the rocket was not manned.

That evening we tried to purchase *Pravda.* No copies were available in Vilno. Later we heard from other Americans that *Pravda* was not available in other cities in the USSR that evening—this part is hearsay, of course. We tried also to listen to the Voice of America. It was jammed. We listened to some Soviet stations but heard no mention of the rocket.

This is the rocket the Soviets tried to recover and later admitted that they had had some trouble with the retrojets; they had fired while the rocket was in the wrong attitude.

So what is the answer? Did that rocket contain only a dummy, as the pravda now claims? Or is there a dead Russian revolving in space?—an Orwellian "unperson," once it was realized that he could not be recovered.

I am sure of this: At noon on May 15 a group of Red Army cadets were unanimously positive that the rocket was manned. That pravda did not change until later that afternoon.

Concerning unpersons—

Rasputin is a fairly well known name in America. I was unable to find anyone in Russia who would admit to having heard of him. He's an unperson.

John Paul Jones is known to every school child in America. After the American Revolution Catherine the Great called him to Russia where he served as an Admiral and helped found the Russian Navy, negligible up to that time. I tried many, many times to find a picture of him in Russian historical museums and I asked dozens of educated Russians about him—with no results. In Russian history John Paul Jones has become an unperson.

Trotsky and Kerensky are not unpersons yet. Too many persons are still alive who recall their leading roles in recent Russian history. But they will someday be unpersons, even though Dr. Kerensky is living today in California. In the USSR it is always tacitly assumed that the

Communists overthrew the Tsar. This leaves no room for Dr. Kerensky. If pinned down, a Soviet guide may admit that there was such a person as Kerensky, then change the subject. The same applies to Trotsky; his role, for good or bad, is being erased from the records. We saw literally thousands of pictures of Lenin, including several hundred group pictures which supposedly portrayed all the Communist VIP's at the time of the Revolution. Not one of these pictures shows Trotsky even though many of them were alleged to be news photos taken at the time when Lenin and Trotsky were still partners and buddies.

This is how unpersons are made. This is how pravda is created.

The theme of the May Day celebration this year was "Miru Mir": "Peace to the World." A sweet sentiment. But it isn't safe to assume that the dictionary definition of peace has any connection with the official Communist meaning, since even yesterday's pravda may be reversed tomorrow.

ON THE WRITING OF SPECULATIVE FICTION

"There are nine-and-sixty ways
Of constructing tribal lays
And every single one of them is right!"
--RUDYARD KIPLING

THERE are at least two principal ways to write speculative fiction — write about people, or write about gadgets. There are other ways; consider Stapleton's "Last and First Men," recall S. Fowler Wright's "The World Below." But the gadget story and the human-interest story comprise most of the field. Most science fiction stories are a mixture of the two types, but we will speak as if they were distinct—at which point I will chuck the gadget story aside, dust off my hands, and confine myself to the human-interest story, that being the sort of story I myself write. I have nothing against the gadget story—I read it and enjoy it—it's just not my pidgin. I am told that this is a how-to-do-it symposium; I'll stick to what I know how to do.

The editor suggested that I write on "Science Fiction in the Slicks". I shan't do so because it is not a separate subject. Several years ago Will F. Jenkins said to me, "I'll let you in on a secret, Bob. *Any* story—science fiction, or otherwise—if it is well written, can be sold to the slicks." Will himself has proved this, so have many other writers—Wylie, Wells, Cloete, Doyle, Ertz, Noyes, many others. You may protest that these writers were able to sell science fiction to the high-pay markets because they were already well-known writers. It just ain't so, pal; on the contrary they are well-known writers because they are skilled at their trade. When they have a science fiction story to write, they turn out a well-written story and it sells to a high-pay market.

An editor of a successful magazine will bounce a poorly-written story from a "name" writer just as quickly as one from an unknown. Perhaps he will write a long letter of explanation and suggestion, knowing as he does that writers are as touchy as white leghorns, but he will bounce it. At most, prominence of the author's name might decide a borderline case.

A short story stands a much better chance with the slicks if it is not more than 5000 words long. A human-interest story stands a better chance with the slicks than a gadget story, because the human-interest story usually appeals to a wider audience than does a gadget story. But this does not rule out the gadget story. Consider "The Note on Danger B" in a recent *Saturday Evening Post* and Wylie's "The Blunder," which appeared last year in *Collier's.*

Let us consider what a story is and how to write one. (Correction: how I write one—remember Mr. Kipling's comment!)

A story is an account which is not necessarily true but which is interesting to read.

There are three main plots for the human interest story: boy-meets-girl, The Little Tailor, and the man-who-learned-better. Credit the last category to L. Ron Hubbard; I had thought for years that there were but two plots—he pointed out to me the third type.

Boy-meets-girl needs no definition. But don't disparage it. It reaches from the "Illiad" to John Taine's "Time Stream." It's the greatest story of them all and has never been sufficiently exploited in science fiction. To be sure, it appears in most s-f stories, but how often is it dragged in by the hair and how often is it the compelling and necessary element which creates and then solves the problem? It has great variety: boy-fails-to-meet-girl, boy-meets-girl-too-late, boy-meets-too-many-girls, boy-loses-girl, boy-and-girl-renounce-love-for-higher-purpose. Not science fiction? Here is a throw-away plot; you can have it free: Elderly man meets very young girl; they discover that they are perfectly adapted to each other, perfectly in love, "soul mates". (Don't ask me how. It's up to you to make the thesis credible. If I'm going to have to write this story, I want to be paid for it.)

Now to make it a science fiction story. Time travel? Okay, what time theory—probable-times, classic theory, or what? Rejuvenation? Is this mating necessary to some greater end? Or vice versa? Or will you transcend the circumstances, as C. L. Moore did in that tragic masterpiece "Bright Illusion"?

I've used it twice as tragedy and shall probably use it again. Go ahead and use it yourself. I did not invent it; it is a great story which has been kicking around for centuries.

The "Little Tailor"—this is an omnibus for all stories about the little guy who becomes a big shot, or vice versa. The tag is from the fairy story. Examples: "Dick Whittington," all the Alger books, "Little Caesar," "Galactic Patrol" (but not "Grey Lensman"), "Mein Kampf," David in the Old Testament. It is the Success story, or, in reverse, the story of tragic failure.

The man-who-learned-better ; just what it sounds like— the story of a man who has one opinion, point of view, or evaluation at the beginning of the story, then acquires a new opinion or evaluation as a result of having his nose rubbed in some harsh facts. I had been writing this story for years before Hubbard pointed out to me the structure of it. Examples: my "Universe" and "Logic of Empire," Jack London's "South of the Slot," Dickens' "A Christmas Carol." The definition of a story as something interesting-but-not-necessarily-true is general enough to cover all writers, all stories—even James Joyce, if you find his stuff interesting. (I don't!) For me, a story of the sort I want to write is still further limited to this recipe: a man finds himself in circumstances which create a problem for him. In coping with this problem, the man is changed in some fashion inside himself. The story is over when the inner change is complete—the external incidents may go on indefinitely. People changing under stress:

A lonely rich man learns comradeship in a hobo jungle.

A milquetoast gets pushed too far and learns to fight.

A strong man is crippled and has to adjust to it.

A gossip learns to hold her tongue.

A hard-boiled materialist gets acquainted with a ghost.

A shrew is tamed.

This is the story of character, rather than incident. It's not everybody's dish, but for me it has more interest than the most overwhelming pure adventure story. It need not be unadventurous ; the stress which produces the change in character can be wildly adventurous, and often is.

But what has all this to do with science fiction? A great deal! Much so-called science fiction is not about human beings and their problems, consisting instead of a fictionized framework, peopled by cardboard figures, on which is hung an essay about the Glorious Future of Technology. With due respect to Mr. Bellamy, "Looking Backward" is a perfect example of the fictionized essay. I've done it myself; "Solution Unsatisfactory" is a fictionized essay, written as such. Knowing that it would have to compete with real *story,* I used every device I could think of, some of them hardly admissible, to make it look like a story.

Another type of fiction alleged to be science fiction is the story laid in the future, or on another planet, or in another dimension, or sich, which could just as well have happened on Fifth Avenue, in 1947. Change the costumes back to now, cut out the pseudoscientific doubletalk and the blaster guns and it turns out to be straight adventure story, suitable, with appropriate facelifting, to any other pulp magazine on the news stand.

There is another type of honest-to-goodness science fiction story which is not usually regarded as science fiction: the story of people dealing with contemporary science or technology. We do not ordinarily mean this sort of story when we say "science fiction"; what we do mean is the speculative story, the story embodying the notion "Just suppose—", or "What would happen if—". In the speculative science fiction story accepted science and established facts are extrapolated to produce a new situation, a new framework for human action. As a result of this new situation, new *human* problems are created—and our story is about how human beings cope with these new problems.

The story is *not* about the new situation; it is about coping with problems arising out of the new situation.

Let's gather up the bits and define the Simon-pure, science fiction story;

1. The conditions must be, in some respect, different from here-and-now, although the difference may lie only in an invention made in the course of the story.
2. The new conditions must be an essential part of the story.
3. The problem itself — the "plot" — must be a *human* problem.
4. The human problem must be one which is created by, or indispensably affected by, the new conditions.
5. And lastly, no established fact shall be violated, and, furthermore, when the story requires that a theory contrary to present accepted theory be used, the new theory should be rendered reasonably plausible and it must include and explain established facts as satisfactorily as the one the author saw fit to junk. It may be farfetched, it may seem fantastic, but it must *not* be at variance with observed facts, i.e., if you are going to assume that the human race descended from Martians, then you've *got* to explain our apparent close relationship to terrestrial anthropoid apes as well. Pardon me if I go on about this. I love to read science fiction, but violation of that last requirement gets me riled. Rocketships should not make banked turns on empty space the way airplanes bank their turns on air. Lizards can't crossbreed with humans. The term "space warp" does not mean anything without elaborate explanation.

Not everybody talking about heaven is going there—and there are a lot of people trying to write science fiction who haven't bothered to learn anything about science. Nor is there any excuse for them in these days of public libraries. You owe it to your readers (a) to bone up on the field of science you intend to introduce into your story (b) unless you yourself are well-versed in that field, you should also persuade some expert in that field to read your story and criticize it before you offer it to an unsuspecting public. Unless you are willing to take this much trouble, please, *please* stick to a contemporary background you are familiar with. Paderewski had to practice; Sonja Henie still works on her school figures; a doctor puts in many weary years before they will let him operate—why should you be exempt from preparatory effort?

The Simon-pure science fiction story—examples of human problems arising out of present science:

Biological warfare ruins the farm lands of the United States; how is Joe Doakes, a used-car dealer, to feed his family?

Interplanetary travel puts us in contact with a race able to read our thoughts; is the testimony of such beings admissible as evidence in a murder trial ?

Men reach the Moon; what is the attitude of the Security Council of the United Nations. (Watch out for this one—and hold on to your hats!)

A complete technique for ectogenesis is developed; what is the effect on home, family, morals, religion? (Aldous Huxley left lots of this field unplowed—help yourself.)

And so on. I've limited myself to *my* notions about science fiction, but don't forget Mr. Kipling's comment. In any case it isn't necessary to know how—just go ahead and do it. Write what you like to read. If you have a yen for it, if you get a kick out of "Just imagine—"f if you love to think up new worlds, then come on in, the water's fine and there is plenty of room.

But don't write to me to point out how I have violated my own rules in this story or that. I've violated all of them and I would much rather try a new story than defend an old one.

I'm told that these articles are supposed to be some use to the reader. I have a guilty feeling that all of the above may have been more for my amusement than for your edification. Therefore I shall chuck in as a bonus a group of practical, tested rules which, if followed meticulously, will prove rewarding to any writer.

I shall assume that you can type, that you know the accepted commercial format or can be trusted to look it up and follow it, and that you always use new ribbons and clean type. Also, that you can spell and punctuate and can use grammar well enough to get by.

These things are merely the word-carpenter's sharp tools. He must add to them these business habits:

1. You must *write.*
2. You must *finish* what you start.
3. You must refrain from rewriting except to editorial order.
4. You must put it on the market.
5. You must keep it on the market until sold.

The above five rules really have more to do with how to write speculative fiction than anything said above them. But they are amazingly hard to follow—which is why there are so few professional writers and so many aspirants, and which is why I am not afraid to give away the racket! But, if you will follow them, it matters not how you write, you will find some editor somewhere, sometime, so unwary or so desperate for copy as to buy the worst old dog you, or I, or anybody else, can throw at him.

PANDORA'S BOX

Once opened, the box could never be closed. But after the myriad swarming Troubles came Hope.

Science fiction is not prophecy. It often reads as if it were prophecy; indeed the practitioners of this odd genre (pun intentional —I won't do it again) of fiction usually strive hard to make their stories sound as if they were true pictures of the future. Prophecies.

Prophesying is what the weatherman does, the race track tipster, the stock market adviser, the fortuneteller who reads palms or gazes into a crystal. Each one is predicting the future—sometimes exactly, sometimes in vague, veiled, or ambiguous language, sometimes simply with a claim of statistical probability, but always with a claim seriously made of disclosing some piece of the future.

This is not at all what a science fiction author does. Science fiction is almost always laid in the future—or at least in a fictional possible-future—and is almost invariably deeply concerned with the shape of that future. But the method is not prediction; it is usually extrapolation and/or speculation. Indeed the author is not required to (and usually does not) regard the fictional "future" he has chosen to write about as being the events most likely to come to pass; his purpose may have nothing to do with the *probability* that these storied events may happen.

"Extrapolation" means much the same in fiction writing as it does in mathematics: exploring a trend. It means continuing a curve, a path, a trend into the future, by extending its present direction and continuing the *shape* it has displayed in its past performance—i.e., if it is a sine curve in the past, you extrapolate it as a sine curve in the future, not as an hyperbola, nor a Witch of Agnesi, and *most certainly not* as a tangent straight line.

"Speculation" has far more elbowroom than extrapolation; it starts with a "What if?"—and the new factor thrown in by the what-if may be both wildly improbable and so revolutionary in effect as to throw a sine-curve trend (or a yeast-growth trend, or any trend) into something unrecognizably different. What if little green men land on the White House lawn and invite us to join a Galactic union?—or big green men land and enslave us and eat us? What if we solve the problem of immortality? What if New York City really does go dry? And not just the present fiddlin' shortage tackled by fiddlin' quarter-measures—can you imagine a man being lynched for wasting an ice cube? Living, as I do, in a state (Colorado—1965) which has just two sorts of water, too little and too much—we just finished seven years of drought with seven inches of rain in two hours, and one was about as disastrous as the other—I find a horrid fascination in Frank Herbert's *Dune World,* in Charles Einstein's *The Day New York Went Dry,* and in stories about Bible-type floods such as S. Fowler Wright's *Deluge.*

Most science fiction stories use both extrapolation and speculation. Consider "Blowups Happen," elsewhere in this volume. It was written in 1939, updated very slightly for book publication just after World War II by inserting some words such as "Manhattan Project" and "Hiroshima," but not rewritten, and is one of a group of stories published under the pretentious collective title of *The History of the Future* (!) (an editor's title, *not* mine!)—which certainly sounds like prophecy.

I disclaim any intention of prophesying; I wrote that story for the sole purpose of making money to pay off a mortgage and with the single intention of entertaining the reader. As prophecy the story falls flat on its silly face—any tenderfoot Scout can pick it to pieces—but I think it is still entertaining as a *story,* else it would not be here; I have a business reputation to protect and wish to continue making money. Nor am I ashamed of this motivation. Very little of the great literature of our heritage arose solely from a wish to "create art"; most writing, both great and not-so-great, has as its proximate cause a need for money combined with an aversion to, or an inability to perform, hard "honest labor." Fiction writing offers a legal and reasonably honest way out of this dilemma.

A science fiction author may have, and often does have, other motivations *in addition to* pursuit of profit. He may wish to create "art for art's sake," he may want to warn the world against a course he feels to be disastrous (Orwell's *1984,* Huxley's *Brave New World*—but please note that each is intensely entertaining, and that each made stacks of money), he may wish to urge the human race toward a course which he considers desirable (Bellamy's *Looking Backward,* Wells' *Men Like Gods*), he may wish to instruct, or uplift, or even to dazzle. But the science fiction writer—*any* fiction writer—must keep entertainment consciously in mind as his prime purpose . . . or he may find himself back dragging that old cotton sack.

If he succeeds in this purpose, his story is likely to remain gripping entertainment long years after it has turned out to be false "prophecy." H. G. Wells is perhaps the greatest science fiction author of all time—and his greatest science fiction stories were written around sixty years ago (i.e., about 1895) . . . under the whip. Bedfast with consumption, unable to hold a job, flat broke, paying alimony—he *had* to make money somehow, and writing was the heaviest work he could manage. He was clearly aware (see his autobiography) that to stay alive he must be entertaining. The result was a flood of some of the most brilliant speculative stories about the future ever written. As prophecy they are all hopelessly dated . . . which matters not at all; they are as spellbinding now as they were in the Gay 'Nineties and the Mauve Decade.

Try to lay hands on his *When the Sleeper Wakes.* The gadgetry in it is ingenious—and all wrong. The projected future in it is brilliant—and did not happen. All of which does not sully the story; it is a great story of love and sacrifice and blood-chilling adventure set in a matrix of mindstretching speculation about the nature of Man and his Destiny. I read it first in 1923, and at least a dozen times since . . . and still reread it whenever I get to feeling uncertain about just how one does go about the unlikely process of writing fiction for entertainment of strangers—and again finding myself caught up in the sheer excitement of Wells' story.

"Solution Unsatisfactory" herein is a consciously Wellsian story. No, no, I'm not claiming that it is of H. G. Wells' quality—its quality is for you to judge, not me. But it was written by the method which Wells spelled out for the speculative story: Take one, just one, basic new assumption, then examine all its consequences—but express those consequences in terms of human beings. The assumption I chose was the "Absolute Weapon"; the speculation concerns what changes this forces on mankind. But the "history" the story describes simply did not happen.

However the problems discussed in this story are as fresh today, the issues just as poignant, for the grim reason that we have not reached even an "unsatisfactory" solution to the problem of the Absolute Weapon; we have reached *no* solution.

In the years that have passed since I wrote that story (in 1940) the world situation has grown much worse. Instead of one Absolute Weapon there are now at least five distinct types—an "Absolute Weapon" being defined as one against which there is no effective defense and which kills indiscriminately over a very wide area. The earliest of the five types, the A-bomb, is now known to be possessed by at least five nations; at least twenty-five other nations have the potential to build them in the next few years.

But there is a possible sixth type. Earlier this year (1965—R.A.H.) I attended a seminar at one of the nation's new think-factories. One of the questions discussed was whether or not a "Doomsday Bomb" could be built—a single weapon which would destroy all life of all sorts on this planet; *one* weapon, not an all-out nuclear holocaust involving hundreds of thousands of ICBMs. No, this was to be a world-wrecker of the sort Dr. E. E. Smith used to use in his interstellar sagas back in the days when SF magazines had bug-eyed monsters on the cover and were considered lowbrow, childish, fantastic.

The conclusions reached were: Could the Doomsday Machine be built?—yes, no question about it. What would it cost?—quite cheap.

A seventh type hardly seems necessary.

And that makes the grimness of "Solution Unsatisfactory" seem more like an Oz book in which the most harrowing adventures always turn out happily.

"Searchlight" is almost pure extrapolation, almost no speculation. The gadgets in it are either hardware on the shelf, or hardware which will soon be on the shelf because nothing is involved but straightforward engineering development. "LifeLine" (my first story) is its opposite, a story which is sheer speculation and either impossible or very highly improbable, as the What-If postulate will never be solved—I think. I hope. But the two stories are much alike in that neither depends on when it was written nor when it is read. Both are independent of any particular shape to history; they are timeless.

"Free Men" is another timeless story. As told, it looks like another "after the blowup" story—but it is not. Although the place is nominally the United States and the time (as shown by the gadgetry) is set in the not-distant future, simply by changing names of persons and places and by inserting other weapons and other gadgets this story could be any country and any time in the past or future—or could even be on another planet and concern a nonhuman race. But the story does also apply here-and-now, so I told it that way.

"Pandora's Box" was the original title of an article researched and written in 1949 for publication in 1950, the end of the half-century. Inscrutable are the ways of editors: it appeared with the title "Where To?" and purported to be a nonfiction prophecy concerning the year 2000 A.D. as seen from 1950. (I agree that a science fiction writer should avoid marijuana, prophecy, and time payments—but I was tempted by a soft rustle.)

Our present editor (1965) decided to use this article, but suggested that it should be updated. Authors who wish to stay in the business listen most carefully to editors' suggestions, even when they think an editor has been out in the sun without a hat; I agreed.

And reread "Where To?" and discovered that our editor was undeniably correct; it needed updating. At least.

But at last I decided not to try to conceal my bloopers. Below is reproduced, unchanged, my predictions of fifteen years back. But here and there through the article I have inserted signs for footnotes—like this: (z)—and these will be found at the end of the 1950 article . . . calling attention to bloopers and then forthrightly excusing myself by rationalizing how anyone, even Nostradamus, would have made the same mistake . . . hedging my bets in other cases, or chucking in brand-new predictions and carefully laying them farther in the future than I am likely to live . . . and, in some cases, crowing loudly about successful predictions. (Addendum 1979: I have interpolated the later comments, and marked each item 1950, or 1965, or 1980.)

So—

THE PRAGMATICS OF PATRIOTISM

In this complex world, science, the scientific method, and the consequences of the scientific method are central to everything the human race is doing and to wherever we are going. If we blow ourselves up we will do it by misapplication of science; if we manage to keep from blowing ourselves up, it will be through intelligent application of science. Science fiction is the only form of fiction which takes into account this central force in our lives and futures. Other sorts of fiction, if they notice science at all, simply deplore it—an attitude very chichi in the anti-intellectual atmosphere of today. But we will never get out of the mess we are in by wringing our hands.

Let me make one flatfooted prediction of the sciencefiction type. Like all scenarios this one has assumptions—variables treated as constants. The primary assumption is that World War Three will hold off long enough—ten, twenty, thirty years—for this prediction to work out . . . plus a secondary assumption that the human race will not find some other way to blunder into ultimate disaster.

Prediction: In the immediate future—by that I mean in the course of the naval careers of the class of '73—there will be nuclear-powered, constant-boost spaceships—ships capable of going to Mars and back in a couple of weeks—and these ships will be armed with Buck-Rogersish death rays. Despite all treaties now existing or still to be signed concerning the peaceful use of space, these spaceships will be used in warfare. Space navies will change beyond recognition our present methods of warfare and will control the political shape of the world for the foreseeable future. Furthermore—and still more important—these new spaceships will open the Solar System to colonization and will eventually open the rest of this Galaxy.

I did *not* say that the United States will have these ships. The present sorry state of our country does not permit me to make such a prediction. In the words of one of our most distinguished graduates in his *The Influence of Sea Power on History:* "Popular governments are not generally favorable to military expenditures, however necessary—"

Every military officer has had his nose rubbed in the wry truth of Admiral Mahan's observation. I first found myself dismayed by it some forty years ago when I learned that I was expected to maintain the ship's battery of USS *Roper* in a state of combat readiness on an allowance of less than a dollar a day—with World War Two staring down our throats.

The United States is capable of developing such spaceships. But the mood today does not favor it. So I am unable to predict that *we* will be the nation to spend the necessary R&D money to build such ships.

(Addressed to a plebe midshipman:)

Mister, how long is it to graduation?

Sixty-two days? Let's make it closer than that. I have . . . 7.59, just short of eight bells. Assuming graduation for ten in the morning that gives . . . 5,320,860 seconds to graduation . . . and I have less than 960 seconds in which to say what I want to say.

(To the Brigade at large:)

Why are you here?

(To a second plebe:)

Mister, why are *you* here?

Never mind, son; that's a rhetorical question. You are here to become a naval officer. That's why this Academy was founded. That is why all of you are here: to become naval officers. If that is *not* why *you* are here, you've made a bad mistake. But I speak to the overwhelming majority who understood the oath they took on becoming midshipmen and look forward to the day when they will renew that oath as commissioned officers.

But why would anyone want to become a naval officer?

In the present dismal state of our culture there is little prestige attached to serving your country; recent public opinion polls place military service far down the list.

It can't be the pay. No one gets rich on Navy pay. Even a 4-star admiral is paid much less than top executives in other lines. As for lower ranks the typical naval officer finds himself throughout his career just catching up from the unexpected expenses connected with the last change of duty when another change of duty causes a new financial crisis. Then, when he is about fifty, he is passed over and retires . . . but he can't really retire because he has two kids in college and one still to go. So he has to find a job . . . and discovers that jobs for men his age are scarce and usually don't pay well.

Working conditions? You'll spend half your life away from your family. Your working hours? "Six days shalt thou work and do all thou art able; the seventh the same, and pound on the cable." A forty-hour week is standard for civilians—but not for naval officers. You'll work that forty-hour week but that's just a starter. You'll stand a night watch as well, and duty weekends. Then with every increase in grade your hours get longer—until at last you get a ship of your own and no longer stand watches. Instead you are on duty twenty-four hours a day . . . and you'll sign your night order book with: "In case of doubt, do not hesitate to call me."

I don't know the average week's work for a naval officer but it is closer to sixty than to forty. I'm speaking of peacetime, of course. Under war conditions it is whatever hours are necessary—and sleep you grab when you can.

Why would anyone elect a career which is unappreciated, overworked, and underpaid? It can't be just to wear a pretty uniform. There has to be a better reason.

As one drives through the bushveldt of East Africa it is easy to spot herds of baboons grazing on the ground. But not by looking at the ground. Instead you look up and spot the lookout, an adult male posted on a limb of a tree where he has a clear view all around him—which is why you can spot him; he has to be where he can see a leopard in time to give the alarm. On the ground a leopard can catch a baboon . . . but if a baboon is warned in time to reach the trees, he can outclimb a leopard.

The lookout is a young male assigned to that duty and there he will stay, until the bull of the herd sends up another male to relieve him.

Keep your eye on that baboon; we'll be back to him.

Today, in the United States, it is popular among self-styled "intellectuals" to sneer at patriotism. They seem to think that it is axiomatic that any civilized man is a pacifist, and they treat the military profession with contempt. "Warmongers"—"Imperialists"—"Hired killers in uniform"—you have all heard such sneers and you will hear them again. One of their favorite quotations is: "Patriotism is the last refuge of a scoundrel."

What they never mention is that the man who made that sneering wisecrack was a fat, gluttonous slob who was pursued all his life by a pathological fear of death.

I propose to prove that that baboon on watch is morally superior to that fat poltroon who made that wisecrack.

Patriotism is the most practical of all human characteristics.

But in the present decadent atmosphere patriots are often too shy to talk about it—as if it were something shameful or an irrational weakness.

But patriotism is *not* sentimental nonsense. Nor something dreamed up by demagogues. Patriotism is as necessary a part of man's evolutionary equipment as are his eyes, as useful to the race as eyes are to the individual.

A man who is *not* patriotic is an evolutionary dead end. This is not sentiment but the hardest sort of logic.

To prove that patriotism is a necessity we must go back to fundamentals. Take any breed of animal—for example, tyrannosaurus rex. What is the most basic thing about him? The answer is that tyrannosaurus rex is dead, gone, extinct.

Now take homo sapiens. The first fact about him is that he is not extinct, he is alive.

Which brings us to the second fundamental question: Will homo sapiens stay alive? Will he survive?

We can answer part of that at once: Individually h. sapiens will *not* survive. It is unlikely that anyone here tonight will be alive eighty years from now; it approaches mathematical certainty that we will all be dead a hundred years from now as even the youngest plebe here would be 118 years old then—if still alive.

Some men do live that long but the percentage is so microscopic as not to matter. Recent advances in biology suggest that human life may be extended to a century and a quarter, even a century and a half—but this will create more problems than it solves. When a man reaches my age or thereabouts, the last great service he can perform is to die and get out of the way of younger people.

Very well, as individuals we all die. This brings us to the second half of the question: Does homo sapiens *as a breed* have to die? The answer is: No, it is *not* unavoidable.

We have two situations, mutually exclusive: Mankind surviving, and mankind extinct. With respect to morality, the second situation is a null class. An extinct breed has *no* behavior, moral or otherwise.

Since survival is the sine qua non, I now define "moral behavior" as "behavior that tends toward survival." I won't argue with philosophers or theologians who choose to use the word "moral" to mean something else, but I do not think anyone can define "behavior that tends toward extinction" as being "moral" without stretching the word "moral" all out of shape.

We are now ready to observe the hierarchy of moral behavior from its lowest level to its highest.

The simplest form of moral behavior occurs when a man or other animal fights for his own survival. Do not belittle such behavior as being merely selfish. Of course it is selfish . . . but selfishness is the bedrock on which all moral behavior starts and it can be immoral only when it conflicts with a higher moral imperative. An animal so poor in spirit that he won't even fight on his own behalf is already an evolutionary dead end; the best he can do for his breed is to crawl off and die, and not pass on his defective genes.

The next higher level is to work, fight, and sometimes die for your own immediate family. This is the level at which six pounds of mother cat can be so fierce that she'll drive off a police dog. It is the level at which a father takes a moonlighting job to keep his kids in college—and the level at which a mother or father dives into a flood to save a drowning child . . . and it is still moral behavior even when it fails.

The next higher level is to work, fight, and sometimes die for a group larger than the unit family—an extended family, a herd, a tribe—and take another look at that baboon on watch; he's at that moral level. I don't think baboon language is complex enough to permit them to discuss such abstract notions as "morality" or "duty" or "loyalty"—but it is evident that baboons *do* operate morally and *do* exhibit the traits of duty and loyalty; we see them in action. Call it "instinct" if you like—but remember that assigning a name to a phenomenon does not explain it.

But that baboon behavior can be explained in evolutionary terms. Evolution is a process that never stops. Baboons who fail to exhibit moral behavior do not survive; they wind up as meat for leopards. Every baboon generation has to pass this examination in moral behavior; those who bilge it don't have progeny. Perhaps the old bull of the tribe gives lessons . . . but the leopard decides who graduates—and there is no appeal from his decision. We don't have to understand the details to observe the outcome: Baboons behave morally—for baboons.

The next level in moral behavior higher than that exhibited by the baboon is that in which duty and loyalty are shown toward a group of your own kind too large for an individual to know all of them. We have a name for that. It is called "patriotism."

Behaving on a still higher moral level were the astronauts who went to the Moon, for their actions tend toward the survival of the entire race of mankind. The door they opened leads to the hope that h. sapiens will survive indefinitely long, even longer than this solid planet on which we stand tonight. As a direct result of what they did, it is now possible that the human race will *never* die.

Many shortsighted fools think that going to the Moon was just a stunt. But the astronauts knew the meaning of what they were doing, as is shown by Neil Armstrong's first words in stepping down onto the soil of Luna: "One small step for a man, one giant leap for mankind."

Let us note proudly that eleven of the Astronaut Corps are graduates of this our school.

And let me add that James Forrestal was the *first* high-ranking Federal official to come out flatly for space travel.

I must pause to brush off those parlor pacifists I mentioned earlier . . . for they contend that *their* actions are on this highest moral level. They want to put a stop to war; they say so. Their purpose is to save the human race from killing itself off; they say that too. Anyone who disagrees with them must be a bloodthirsty scoundrel—and they'll tell you that to your face.

I won't waste time trying to judge their motives; my criticism is of their mental processes: Their heads aren't screwed on tight. They live in a world of fantasy.

Let me stipulate that, if the human race managed its affairs sensibly, we could do without war.

Yes—and if pigs had wings, they could fly.

I don't know what planet those pious pacifists are talking about but it can't be the third one out from the Sun. Anyone who has seen the Far East—or Africa—or the Middle East—knows or certainly should know that there is *no* chance of abolishing war in the foreseeable future. In the past few years I have been around the world three times, traveled in most of the communist countries, visited many of the so-called emerging countries, plus many trips to Europe and to South America; I saw nothing that cheered me as to the prospects for peace. The seeds of war are everywhere; the conflicts of interest are real and deep, and will not be abolished by pious platitudes.

The best we can hope for is a precarious balance of power among the nations capable of waging total war—while endless lesser wars break out here and there.

I won't belabor this. Our campuses are loaded with custard-headed pacifists but the yard of the Naval Academy is one place where I will not encounter them. We are in agreement that the United States still needs a navy, that the Republic will always have need for heroes—else you would not be here tonight and in uniform.

Patriotism— Moral behavior at the national level. Non sibi sed Patria. Nathan Hale's last words: "I regret that I have but one life to give for my country." Torpedo Squadron Eight making its suicidal attack. Four chaplains standing fast while the water rises around them. Thomas Jefferson saying, "The Tree of Liberty must be refreshed from time to time with the blood of patriots—" A submarine skipper giving the order "Take her *down*!" while he himself is still topside. Jonas Ingram standing on the steps of Bancroft Hall and shouting, "The Navy has no place for good losers! The Navy needs tough sons of bitches who can go out there and *win*!"

Patriotism— An abstract word used to describe a type of behavior as harshly practical as good brakes and good tires. It means that you place the welfare of your nation ahead of your own even if it costs you your life.

Men who go down to the sea in ships have long had another way of expressing the same moral behavior tagged by the abstract expression "patriotism." Spelled out in simple Anglo-Saxon words "Patriotism" reads "Women and children first!"

And that is the moral result of realizing a self-evident biological fact: Men are expendable; women and children are not. A tribe or a nation can lose a high percentage of its men and still pick up the pieces and go on . . . as long as the women and children are saved. But if you fail to save the women and children, you've had it, you're done, you're *through!* You join tyrannosaurus rex, one more breed that bilged its final test.

I must amplify that. I know that women can fight and often have. I have known many a tough old grandmother I would rather have at my side in a tight spot than any number of pseudomales who disdain military service. My wife put in three years and a butt active duty in World War Two, plus ten years reserve, and I am proud—very proud! —of her naval service. I am proud of every one of our women in uniform; they are a shining example to us men.

Nevertheless, as a mathematical proposition in the facts of biology, children, and women of childbearing age, are the ultimate treasure that we must save. Every human culture is based on "Women and children first"—and any attempt to do it any other way leads quickly to extinction.

Possibly extinction is the way we are headed. Great nations have died in the past; it can happen to us.

Nor am I certain how good our chances are. To me it seems self-evident that any nation that loses its patriotic fervor is on the skids. Without that indispensable survival factor the end is only a matter of time. I don't know how deeply the rot has penetrated—but it seems to me that there has been a change for the worse in the last fifty years. Possibly I am misled by the offensive behavior of a noisy but unimportant minority. But it does seem to me that patriotism has lost its grip on a large percentage of our people.

I hope I am wrong . . . because if my fears are well grounded, I would not bet two cents on this nation's chance of lasting even to the end of this century.

But there is no way to force patriotism on anyone. Passing a law will not create it, nor can we buy it by appropriating so many billions of dollars.

You gentlemen of the Brigade are most fortunate. You are going to a school where this basic moral virtue is daily reinforced by precept and example. It is not enough to know what Charlie Noble does for a living, or what makes the wildcat wild, or which BatDiv failed to splice the main brace and why—nor to learn matrix algebra and navigation and ballistics and aerodynamics and nuclear engineering. These things are merely the working tools of your profession and could be learned elsewhere; they do not require "four years together by the Bay where Severn joins the tide."

What you do have here is a tradition of service. Your most important classroom is Memorial Hall. Your most important lesson is the way you feel inside when you walk up those steps and see that shot-torn flag framed in the arch of the door: "Don't Give Up the Ship."

If you feel nothing, you don't belong here. But if it gives you goose flesh just to see that old battle flag, then you are going to find that feeling increasing every time you return here over the years . . . until it reaches a crescendo the day you return and read the list of your own honored dead—classmates, shipmates, friends—read them with grief and pride while you try to keep your tears silent.

The time has come for me to stop. I said that "Patriotism" is a way of saying "Women and children first." And that no one can force a man to feel this way. Instead he must embrace it freely. I want to tell about one such man. He wore no uniform and no one knows his name, or where he came from; all we know is what he did.

In my home town sixty years ago when I was a child, my mother and father used to take me and my brothers and sisters out to Swope Park on Sunday afternoons. It was a wonderful place for kids, with picnic grounds and lakes and a zoo. But a railroad line cut straight through it.

One Sunday afternoon a young married couple were crossing these tracks. She apparently did not watch her step, for she managed to catch her foot in the frog of a switch to a siding and could not pull it free. Her husband stopped to help her.

But try as they might they could not get her foot loose. While they were working at it, a tramp showed up, walking the ties. He joined the husband in trying to pull the young woman's foot loose. No luck—

Out of sight around the curve a train whistled. Perhaps there would have been time to run and flag it down, perhaps not. In any case both men went right ahead trying to pull her free . . . and the train hit them.

The wife was killed, the husband was mortally injured and died later, the tramp was killed—and testimony showed that neither man made the slightest effort to save himself.

The husband's behavior was heroic . . . but what we expect of a husband toward his wife: his right, and his proud privilege, to die for his woman. But what of this nameless stranger? Up to the very last second he could have jumped clear. He did not. He was still trying to save this woman he had never seen before in his life, right up to the very instant the train killed him. And that's all we'll ever know about him.

This is how a man dies.

This is how a *man* . . . lives!

THE DISCOVERY OF THE FUTURE

Here in my hand is the manuscript of a speech. If it works out anything like the synopses I have used, this speech will still be left when I get through.

Before I start, I want to mention an idea that might be fun. It was an innovation in political speaking introduced in California by Upton Sinclair that raised Cain with the ordinary run of political speakers: answering questions from the platform. But I want to put one reservation on it, and that is that questions should be in writing, with names signed, so we can read them into the mike so that I can have clearly in mind what the questions are.

During the course of the last day or so, I have gathered the impression that quite a number of people are interested in the background of my stories; and; in some cases, in my social and political ideas, economic ideas, etc.—some of which, but not all, shows in my stories. Some of them have evidenced an interest in my own personal background. So, if the question comes along, I will do my best to answer it, perhaps dodging the embarrassing ones a little.

To get to the talk itself: THE DISCOVERY OF THE FUTURE. I was told that there was no time limit, so I assumed that he wanted my usual three hour speech. Or, perhaps, we can just keep going until the hall is cleared.

Forry [Ackerman] told you that I have been reading science fiction for a longtime. I have. I have been reading it as long as I could get hold of it, and I probably experienced much the same process most of you did: parental disapproval, those funny looks you get from friends, for reading “that kind of junk.”

We here, the science fiction fans, are the lunatic fringe! We are the crazy fools who read that kind of stuff—who read those magazines with the outlandish machines and animals on the covers. You leave one around loose in your home and a friend will pick it up. Those who are not fans ask you if you really read that stuff, and from then on they look at you with suspicion.

Why do we do it? I think I know. This is an opinion, but it is probably why we like science fiction. It is not just for the adventure of the story itself—you can find that in other types of stories. To my mind it is because science fiction has as its strongest factor the single thing that separates the human race from other animals—I refer to a quality which has been termed "time-binding." With a hyphen. It's a term that may not have come to your attention. It is a technical term invented by Alfred Korzybski, and it refers to the fact that the human animal lives not only in the present, but also in the past and the future.

The human animal differs from all other animals *only* in this one respect. The definition includes both reading and writing. That is the primary technique whereby we are able to make records, to gather data and to look into the future. Other things we do that we think of as making us humans rather than animals—some animals have done at sometime. They form governments. They invent machines. Some animals even use money. I have not seen them doing it, but I have heard reports that I believe to be credible. But time-bind they do not do, to anything like the extent that the human race does.

Time-binding consists of making use of the multitudinous records of the past that we have. On the basis of those records, the data we have collected directly and the data that we get from others by means of time-binding techniques, including reading and writing, we are able to plan our future conduct. It means that we have lived mentally in the past and in the future, as well as in the present. That is certainly true of science fiction fans.

I like the term Future Fiction that Charlie Hornig gave it. It seems to me a little broader than Science Fiction because most of these stories are concerned with the future—what will happen.

In taking the future into account, trying to predict what it will be, and trying to make your plans accordingly, you are time-binding. The childlike person lives from day to day. The adult tries to plan for a year or two at least. Statesmen try to plan for perhaps twenty years or more. There are a few institutions which plan for longer than the lives of men, as for example, the Smithsonian Institution and the Catholic Church, that think not in terms of lifetimes, but in centuries. They make their plans that far ahead, and to some extent, make them work out.

Science fiction fans differ from most of the rest of the race by thinking in terms of racial magnitudes—not even centuries, but thousands of years. Stapledon thinks in terms of. . . how many years? How far does his time scale go? I don't know: the figures mean nothing to me,

That is what science fiction consists of—trying to figure out from the past and from the present what the future may be. In that we are behaving like human beings.

Now, all human beings time-bind to some extent when they try to discover the future. But most human beings—those who laugh at us for reading science fiction— time-bind, make their plans, make their predictions, only within the limits of their personal affairs. In that respect, they may try to predict for a year or two, make plans, even try to predict for their entire lifetimes, but they rarely try to predict in terms of the culture in which they live. In fact, most people, as compared with science fiction fans, have no conception whatsoever of the fact that the culture they live in *does* change, that it *can* change. Even though they may believe it with the top of their minds, they don't believe it way back in the thalamus, in their emotions.

Our grandfathers thought the horse could never be replaced by the auto. Four years after the Wright brothers first flew, they were still trying to get the War Department to come out to look at the airplane. And when one Major General did take a look at an airplane flying, he remarked that it was a very interesting scientific toy, but, of course, it had no possible military application! That was just a short time ago, a very short time.

You will hear that sort of thing around you all the time. I made use, a while ago, of a quotation I would like to use again, from 0. B. Shaw. Referring to Brittanicus in *Caesar and Cleopatra,* he said, "he is an outlander and a barbarian and he believes that the customs of his tribe are the laws of nature." That is what you are up against when you try to get most people to read science fiction. That is why they think you are crazy, because they believe that the customs of their tribe are the laws of nature, immutable and unchanging. They do not believe in changes.

Phrases like "There'll always be an England" are pleasant and inspiring at the present time, but *we* know better. There won't always be an England, nor a Germany, nor a United States, a Baptist Church, nor monogamy, nor the Democratic Party, nor the modesty taboo, nor the superiority of the white race, nor airplanes. Nor automobiles. They will go. They will be gone—we'll see them go. Any custom, institution, belief, or social structure that we see around us today will change, will pass, and most of those we will *see* change and pass.

In science fiction, we try to envision what those changes might be.

Our guesses are usually wrong; they are almost certain to be wrong. Some men, with a greater grasp on data than others, can do remarkably well. H. G. Wells, who probably knows more (on the order of ten times as much, or perhaps higher) than most science fiction writers, has been remarkably successful in some of his predictions. Most of us aren't that lucky;

I do not expect my so-called *History of the Future* to come to pass. I think some of the trends in it may show up, but I do not think that my factual predictions as such are going to come to pass, even in their broad outlines.

You speak of this sort of thing to an ordinary man— tell him that things are going to change—he will admit it, but he does not believe it at all. He believes it just with the top of his mind. He believes in "progress." He thinks things will get a little bit bigger, and louder, and brighter, a few more neon signs. *But he does not believe that any actual change in the basic nature of the culture in which he lives, or its technology, will take place.*

Airplanes he thinks are all right, but those crazy rocket ship things! Why, a rocket ship couldn't possibly fly. It hasn't got anything to PUSH on. That is the way he feels about it.

There will never be any rocket ships. That is all right for Buck Rogers in the funny papers. He does not believe that there could be rocket ships, nor does he believe that there will be things that will make rockets look like primitive gadgets that even the wildest of the science fiction writers have not been able to guess or think about. Rocket ships are about as far as I am willing to go because I have not got data enough to think about, to make a reasonable guess about the other forms of transportation or gadgets we may have.

But that same man did not believe in airplanes in 1910!

I have spoken primarily of mechanical changes because they are much easier to show, to point to, than the more subtle sociological changes, cultural changes, changes in our customs. Some of these can be pointed out. I would like to point out one of them right now. The word "syphilis" could not be used in public even as short a time as fifteen years ago.

Yet, as I used it here, I did not see any shock around the room—nobody minded it—even the *Ladies' Home Journal* runs articles on it. We are getting a little more civilized in that respect than we were twenty years ago. Our grandfathers considered that word indecent. They believed that things that were decent and indecent were subject to absolute rules, that they were laws of nature. The majority of people around us now believe that their criteria of decency and indecency are absolute, that they won't change, that there are some things that are *right,* and some things that are *wrong.* They do not know enough about past history to be able to make any predictions about the future.

I could think of some rude words to use in that connection, words that are still rude now. I think it quite possible that twenty years from now on this same platform I could use those words and not produce any shock around the room.

For things *do* change. And words which we consider utterly indecent today may very possibly simply be used as tags, as terms with no emotional connotation to them, twenty years from now.

We happen to live in a period of sudden and drastic change in a good many of the things that happen to us. I think it is extremely important that we be prepared for that change and for that reason, I think that science fiction fans are better prepared to face the future than the ordinary run of people around them, because they believe in change.

To that extent, I think that science fiction, even the corniest of it, even the most outlandish of it, no matter how badly it's written, has a distinct therapeutic value because *all* of it has as its primary postulate that the world *does* change. I cannot overemphasize the importance of that idea.

Unless you believe that, unless you are prepared for it—as I know all of you are—you can't retain your sanity these days. When a man makes predictions and they keep failing to come true, time and again, he goes insane, functionally insane. It has been proved in laboratories time and again. It has been proved with respect to men, but I'll give an illustration with respect to animals.

The well-known experiment was performed with rats, an experiment in which a rat was disappointed in his predictions time and again. He went crazy. It happens to work the same way with men. Things do not necessarily work the same way with animals as they do with men, but in this case, there is data to prove it. The inability to believe in change makes absolutely certain that your prediction will disappoint you. That does not apply to this group, but it does apply to a great many people.

For that reason, I believe we are in a period in which large portions of the human race will be in a condition of, if not insanity, at least unsanity. We see that over a large portion of the world today. I think we have seen it crawling up on us for a number of years. In 1929 we had the market crash and people jumped out of the window as a result of not being able to predict things which were perfectly obvious, written on the face of the culture, something that would happen.

The Depression came along, and the madhouses filled up again.

Other only slightly less slaphappy individuals proceeded to be a bit unsane by concocting the most wildly unscientific schemes for making everybody rich by playing musical chairs.. Not quite crazy—they could still find their way around and take street cars and not get lost, but not quite sane either. That can lead, if it goes on long enough, to a condition of mass insanity that none of us is going to like.

Nevertheless, we science fictionists, I think, are better prepared for it than others. During a period of racial insanity, mass psychoses, hysteria, manic depression, paranoia, it is possible for a man who believes in change to hold on, to arrest his judgment, to go slow, to take a look at the facts, and not be badly hurt. Things will probably happen to us, very unpleasant indeed, we can't separate ourselves from the matrix in which we find ourselves. Nevertheless, WE stand a chance, for I am very much afraid that a great many people of the type who laugh at us for dealing with this stuff, will not be able to hang on.

The important thing is to hang on to your sanity, to preserve sanity while it happens—no matter what bad things happen to the world.. As individuals it may be difficult for us to do anything about it, even though all of us in our own ways, and according to our lights, are trying. But this series of wars that we find the world in now may go on for another five years, ten years, twenty years—it may go on for fifty years—you and I may not live to see the end of it.

I, personally, have hopes—wishful thinking—that it will terminate quickly enough so that I can pass the rest of my lifetime in comparative peace and comfort. But I'm not optimistic about it. During such a period, it is really difficult to keep a grip on yourself, but I think that we are better prepared to than some of the others.

I can speak more freely here than I could in a political. meeting, because it's a highly selected group. I've known a good many science fiction fans, and I've observed, statistically, certain things about them. Most of them are young as compared with other groups, most of them are extremely precocious—quite brilliant. I'd be very much interested to see IQs run on a typical group of fans.

But, even without IQs I know that most of the people here are way above average in intelligence. I've had enough data on it to know. I'm not trying to flatter you, I'm not interested in that. I am interested in the fact that you have unusually keen minds. However, that lays us open, and I am including myself in this, lays us open to dangers that don't hit the phlegmatic, the more stolid. Unless we are able to predict, we are even more likely to be subjected to functional unsanities than those around us.

I'm preaching, sure. I know that. I could have filled a speech with wisecracks and with stories and anecdotes, but I feel very deeply about this. And if you can bear with me for a few minutes more, I still want to talk about it.

There's a way out, there's something that we can do to protect ourselves, something that would protect the rest of the human race from the sort of things that are happening to them, and are going to happen to them. It's very simple, and it's right down our alley: the use of the *scientific method.*

I'm not talking about the scientific method used in the laboratory. The scientific method can be used to protect ourselves from serious difficulties of other sorts—getting our teeth smashed in—in our everyday life, twenty-four hours of the day.

I should say what I mean by the scientific method. Since I have to define it in terms of words, I can't be as clear as I might be if I were able to make an extensional definition. But I mean a comparatively simple thing by the scientific method: the ability to look at what goes on around you. Listen to what you hear, observe, note facts, delay your judgment, and make your own predictions. That's all there is, really, to the scientific method: to be able to distinguish facts from nonfacts.

I used the term "fact." I used it in a technical sense, and I should say what I mean by a fact. A fact is anything that has happened before this moment, on July 4th, 1941. Anything that has already happened before this moment. Anything after this moment is a nonfact. Most people can't distinguish between them. They regard as a *fact* that they're going to get up and have breakfast tomorrow morning. They get the difference between facts and nonfacts completely mixed up, and in particular, these days people are getting very mixed up between facts and. theories, isms, ologies and so forth, so-called "laws of nature," depending on what year you happen to be speaking.

That distinction between fact and fiction, fact and nonfact, is of extreme importance to us now. It has even become a strong issue in the field of science fiction. Without referring to any movement by name, or any person by name, because I wish to make an illustration, I want to invite your attention to the fact that the science fiction field has been very much stirred up by a semipolitical movement which uses the word "fact" quite extensively. But it uses the word fact with reference to what they are—what they *predict* will happen in the future, and that's a nonfact. And any movement, institution, any theory, which does not make a clear and decided distinction between fact and nonfact, cannot by any stretch of the imagination be called a scientific movement. It simply is not because it does not use the scientific method. No matter how complicated their terminology may be, or how much they may use the *argot* of science.

I'm going to have to make an excursion here. I've wandered somewhat from the talk I had in mind.

I want to make another comment on science fiction and the fact that you and I have to put up with an awful lot of guff from people because of the orthodox point of view with which it is regarded.

I have never been able to understand quite why it is that the historical novel is the most approved, the most *sacred* form of literature. The contemporary novel is next so; but the historical novel, if you write an historical novel, that's *literature.*

I think that the corniest tripe published in a science fiction magazine (and some of it isn't too hot, we know that; some of my stuff isn't so hot) beats all of the *Anthony Adverses* and *Gone With the Winds* that were ever published, because at least it does include that one distinctly humanlike attempt to predict the future.

One would think that the literary critics and the professors of English—those who make a business of deciding what is good and what is bad in literature—had some connection in their ancestry with the Fillyloo Bird. I think you know the Fillyboo Bird: he flew backwards because he didn't care where he was going, but he liked to see where he had been.

I want to mention the fashion in which the scientific method—just the matter of observing what goes on around you—observing it through your own eyes, instead of taking other people's opinions, reserving your judgments until you have enough data on which to make a judgment—can be of real use to you even now, quite aside from any possible worse period in history, in the coming history.

I mentioned that it can keep your teeth from getting knocked in; that's an important point. It can because you'll stay out of controversies and out of arguments that you would otherwise get into. If you are talking with a man who obviously does not bother to use the scientific method, or does not know how to use the scientific method in his everyday life, you'll never get in an argument with him. You'll know there's no point in an argument with him, that you cannot possibly convince him. You can listen—and you'll get some new data from him—and you'll be better able to predict thereafter, if on no other point than the fact that you'll be better able to predict what his reactions will be.

There are other advantages, in the way of keeping yourself cooled down, so you can be a little happier. For example, a man who uses the scientific method cannot possibly be anti-Semitic. I have made that an illustration because it has caused a lot of trouble in the world lately. Why can't he be anti-Semitic? For a very simple reason: he doesn't have enough data, consequently he hasn't formed an opinion. No matter how long he lives he can’t hate all Jews, and unless he knows all Jews, he can’t hate all Jews, because he doesn’t form an opinion unless he has data. It is possible for him to hate an individual Jew as it’s possible for him to hate an individual Irishman or Rotarian or man or woman.

But he can’t possibly be anti-Semitic. He can’t hate all capitalists, he can’t hate all unions, he can’t hate all women—you can’t be a woman-hater, not if you use the scientific method. You can’t possibly: you don’t know all women. You don’t even know a large enough percentage of the group to be able to form an opinion on what the whole group may be!

By the same reasoning, it’s very difficult for him to hate at all; and if you can just manage to keep hate out of your life (or a good portion of it—I can’t keep it *all* out of my life myself. I’ve got to sit down and whip myself about the head and shoulders to get myself calmed down at times—but you can help yourself with this method)—if you can keep hate out of your life, you can keep from; getting your teeth knocked in. You can keep out of a lot of difficulties and take care of yourself in a better fashion.

A man who uses the scientific method cannot possibly believe that all politicians are crooks, for he knows that one datum destroys the generalization. I’ll give you one datum on that point: Senator George Norris, whether you like him or not, is a saint on earth. Whether you agree with his opinions or not, he’s not a bad man.

And because he’s never entirely certain of his own opinions on any subject, a man using the scientific method stays out of arguments, keeps himself from the emotional upsets that cause you to lose sleep and upset your stomach. You get such things as herpes—oh, I’m not an M.D., but there are plenty of functional disorders that a man can avoid, can very well avoid.

Here’s a rough picture of the scientific man in everyday life. Such a man stands a better chance of living through our period to a ripe and-happy old age, in my opinion. But I wish to make plain that the use of the scientific method does not depend on any formal education in science. It is an attitude and point of view and not a body of information. You need have no formal education at all to use the scientific method in your everyday life. I am not disparaging the body of scientific information that has been gathered by specialists or the equally enormous body of historical and sociological data that is available. Unfortunately, we can’t get very much of it. But you can still use the scientific method, whether you’ve bad a lot of education or not, whether you’ve had time to gather a lot of personal data or not.

With respect to the acquisition of scientific training, I’ve heard people around fan clubs remark, “I wish I knew something about mathematics,” or “I wish I understood something about physics.” Complaints that they’re not fully appreciating some of the stories because they don’t have enough specialized information. Some subject was too hard, or they weren’t able to go far enough in school. I greatly sympathize with that.

I’m not trying to play it down or anything of the sort. It’s very much of a regret to me that I’m not at least twins and preferably triplets, so that I could have time to study the various things that I’m interested in. And I know that a lot of you have felt the same way—that life is just too—not too short, but too narrow—we don’t have room enough, time enough, to get around and learn all the things that we want to, and it is almost impossible for us to get a full picture of the world.

Surprising, that the data actually is available. God knows that no one can even hope to cover even a small corner of the scientific world these days. I think there’s a way out of the dilemma, however, a fair one for us, and a better one for our children. It’s the creation of a new technique to cover just that purpose. Men who might be considered encyclopedists, or interpreter-synthesists, I like to call them, men who make it their business to find out what it is the specialists have learned, and then apply it to the rest of us in consolidated form so that we can have, if not the details of the picture, at least the broad I outlines of the enormous, incredibly enormous, mass of data that the human race has gathered. The facts behind us, the things that have happened before this moment, so that we can be better able to predict for ourselves, plan our lives after this moment.

There’s only one synthesist who has really made such an attempt up to the present time, and I’m very pleased that it happens to be possibly the greatest of the science fiction writers: H. G. Wells. Wells perhaps didn’t do a good job of it—good Lord! he didn’t have a *chance* to; he had nobody before him, he did the pioneer work. He started it. But H. G. Wells, in his trilogy, *The Outline of History, The Science of Life* and *The Work, Wealth, and Happiness of Mankind,* is, so far as I know, the only writer who has ever lived who has tried to draw for the rest of us a full picture of the whole world, past and future, everything about us, so we can stand off and get a look at ourselves.

It will be better in the future. Nevertheless, it was great work, the fact that he *did* it, that he tried at all. A wonderful work. Because he had done that kind of work, that he tried to do that kind of work for the rest of us, is the reason, to my mind why his scientific fantasies are more nearly accurate in their predictions than those of, oh, myself, and various other commercial writers in the field. I don’t know as much as H. G. Wells: I probably never will know as much as H. U.

Wells—my predictions can't be as accurate.

But, after considering H. G. Wells' trilogy, it occurred to me that it would be amusing, to me at least, and I hope to you, for me to mention some books by assorted writers that, to a certain extent, help to fill in the gaps in the picture. And—to a certain extent, help to make up the lack of a broad comprehensive scientific education, which no one, not even Sc.D.s and Ph.D.s, can really have.

For example, in mathematics, is there one book which will help the nonmathematician, the person who hasn't specialized in it and made it his life work, to appreciate what mathematics is for? I've run across such a book; it's called Mathematics and the Imagination by Kasner and Newman. You don't have to have any mathematical education to read it. To my mind, it's a very stimulating book, a very interesting book, and when you've finished reading it, you at least know what the mathematicians are doing and why.

Among other things, you will discover—and this runs entirely contrary to our orthodox credos—that mathematics is not a science. Mathematics is not a science at all—it's an aspect of symbology, along with the alphabet. That there is no such thing as discovering mathematics, for example. Mathematics is invented; it's an invented art, and has nothing directly to do with science at all, except as a tool. And yet you will hear the ordinary layman speaking time and again of mathematics as a science. It just plain is not because it has no data in it; purely inventions, every bit of it, even the multiplication tables. Yes, 2 x 2 is 4 is an invention in mathematics, not a fact.

There are other such books. In physics, there is Eddington's Nature of the Physical World, I think one of the most charming books ever written, one of the most lucidly and brilliantly written books. It gives a beautiful background to modern physics. It's approximately fifteen years old, so in order to cover a lot of the things that are currently being used for fiction in the science fiction field, you would need to supplement that. The book I got for my own purpose to supplement it —because, you see, I'm not a professional physicist, I'm an engineer— to help to bring it up to date, is White's *Classical and Modern Physics,* published in 1940. It is about the latest book-bound thing on modern physics that I know of.

There are later things in such publications as *Physical Review* and *Nature,* but this goes up to and including the fission of uranium. It includes nuclear physics, and it delighted me to find the thought that, very likely when we got around to it, we'd find life on other planets. A very stimulating thing to get from a professional scientist, particularly in the field of *physical* sciences. I picked that book because White is an associate of Lawrence in the nuclear laboratory at Berkeley. In other words, he is in on the ground floor, he knows what he's talking about.

It's modern physics, 1940, the best up to that time.

So far as astronomy is concerned, I've never seen anything that surpassed, for a popular notion of the broad outlines of the kind of physical world we live in, than John Campbell's series that appeared in *Astounding.* They started in 1936, and ran on for fifteen or sixteen issues, his articles on the solar system. I've always been sorry that Campbell did not go on from there and cover stellar astronomy, galactic astronomy, and some of the other side fields. But, even at that, anybody who has read through that series by Campbell on the solar system will never again have a flat-world attitude, which most people do have. Not in the science fiction field, of course—I mean not among fans of science fiction.

(I speak many times as if the human race were divided into two parts, as it *may* be; people who love science fiction, and people who don't. I think you will be able to keep sorted out which ones I'm talking about. I hope so.)

In the field of economics, an incomplete science, but nevertheless one that you can't possibly ignore, I think the most illuminating book I've ever, read is one by Maurice Colburn, called *Economic Nationalism.* The title won't give any suggestion of what the contents are, but that is simply the tag by which it is known.

Jim Fancy's *Behind the Ballots* is probably as nice a job of recording actual data in politics as I've ever seen; however, politics—I'd never recommend that people read books in the political field.

Go out and take a look *yourself* Everything else you hear is guff.

I saved for the last on that list of the books that have greatly affected me, that to my mind are key books, of the stuff I've plowed through, a book which should head the list on the *must* list. I wish that everyone could read the book. There aren't many copies of it, and everyone can't, nor could everyone read this particular book. All of you could—you've got the imagination for it. It's *Science and Sanity* by Count Alfred Korzybski, one of the greatest Polish mathematicians when he went into the subject of symbology and started finding out what made us tick, and then worked up in strictly experimental and observational form from the preliminary work of E. T. Bell.

A rigor of epistemology based on E. T. Bell [break in transcript here—some words lost]. . . symbology of epistemology. The book refers to the subject of semantics. I know from conversation with a lot of you that the words epistemology and semantics are not unfamiliar to you. But because they may be unfamiliar to some, I'm going to stop and give definitions of those words.

Semantics is simply a study of the symbols we use to communicate. General Semantics is an extension of that study to investigate how we *evaluate* the use of those symbols. Epistemology is the study of *how* we know *what* we know. Maybe that doesn't sound exciting. It is exciting, it's very exciting. To be able to delve back into your own mind and investigate what it is you know, what it is you *can* know, and what it is that you *cannot possibly* know, is, from a standpoint of intellectual adventure, I think, possibly-the greatest adventure that a person can indulge in. Beats spaceships.

Incidentally, any of you who are going to be in Denver in the next five or six weeks will have an opportunity, one of the last opportunities, to hear Alfred Korzybski speak in person. He will be here at a meeting (similar to this) of semanticians from all over the world; McLean from Los Angeles, and Johnson from Iowa, and Reisser from Mills College and Kendig and probably Hayakawa from up in Canada—the leading semanticians of the world—to hear Korzybski speak.

It is much better to hear him speak than it is to read his books. He's limited by the fact that he's got to stick to the typewriter, to the printed word, but when he talks, when he talks, it's another matter! He gestures, he's not tied down with his hands to the desk the way I am, he walks, stumps all around the stage, and waves his hands, and when he's putting quotation marks on a word, he puts them on… [illustrates, audience laughs]. And you really gather what he means. Incidentally, he looks like Conan Doyle's description of Professor Challenger if Professor Challenger had shaved his beard. Dynamic character.

You may not like him personally, but he's at least as great a man as Einstein, at least, because his field is broader. The same kind of work that Einstein did, the same kind of work using the same methods, but in a much broader field, much closer to human relationships. I hope that some of you will be able to hear him. I said that this will be one of the last chances, because the old man's well over seventy now. As he puts it, "I vill coagulate someday, I vill someday soon, I vill coagulate," which is the term he uses for dying.

He speaks in terms of colloidal chemistry. Properly, it's appropriate. He won't last much longer. In the meantime, he's done a monumental piece of work that H. G. Wells did in the matter of description, and the two together are giants in our intellectual horizon, our intellectual matrix today, that stick up over the rest like the Empire State Building.

I started out to talk primarily about science fiction and I got off on some of my own hobbies. It's a luxury to me not to be held down by a plot and a set of characters. Here I can say anything I like and not be bothered.

I myself have been reading science fiction since Gernsback started putting it out in the *Electrical* Experimenter. Then I read it in *Argosy* and I dug up all that I could out of the Kansas City Public Library. Every member of my family had a library card; there were seven of us, so I could bring home quite a number of books at one time. I wear glasses now as a result. I never had any particular notion of writing it until about two years ago when a concatenation of peculiar circumstances started me writing. I happened to hit the jackpot on the first one, so I continued writing. It amazed me to discover that people gave money away for doing things like that—it beats working.

It's likely that I won't be writing very much longer. With the way things are shaping up, I'll probably have other things I'll have to do, as will others here, whether we like it or not. But I hope to be a fan of science fiction for at least fifty years if I can hold myself together that long and keep from getting my teeth kicked in.

All I really want to do is to hang around as long as I can, watch the world unfold, see some of the changes—what they really are—that suits me.

An Open Letter

Send your membership dues to the L-5 Society, 1620 N. Park Ave., Tucson, AZ 85719 602/622-6351

Dear Friend:

If SF is simply fun and/or money to you, skip this. But if you believe as I do that our race can and will and must spread out into space, stick around.

L-5 Society's sole purpose is to place a colony at Lagrange Point #5, the one trailing the Moon at 60°.

Sounds silly? It does to us, too, on gloomy days. We are about as far along as Willy Ley and Von Braun and Goddard were in the '30s . . . but one generation later Neil Armstrong stepped down on Luna.

And things move faster today. Technology doubles every seven years. We could build that city in space today ... but we'll be able to build it faster, easier, more economically in the '90s. Or (I'm an optimist!) in the '80s. I have already lived from horse & buggy to space shuttle; I cannot believe that human progress will come to a sudden stop. Space will be colonized.

Space will be colonized . . . although possibly not by us. If we lost our nerve, there are plenty of other people on this planet. The construction crews may speak Chinese or Russian -Swahili or Portuguese. It does not take "good old American know-how" to build a city in space. The laws of physics work just as well for others as they do for us.

I don't think we've lost our nerve. We can put a construction crew of our own up there . . . and space is big enough for everyone—all races, all languages. We need never be crowded again.

Dues are $20/year ($15 for students) and include the monthly magazine L-5 News with all the latest space news, data not in newspapers and must be dug out from technical journals and specialized sources—our editors do it for you. The Society supplies other services, too, but I'm not going to list them, as the L-5 Society was not organized to serve or amuse its members.

ITS SOLE PURPOSE IS TO FOUND THE FIRST COLONY IN SPACE!

How's your nerve? Are your eyes on the stars? Send in your dues and join us.

Welcome aboard!

Robert A. Heinlein

Membership Committee

SPINOFF

On 2 July 1979 I received a letter calling me to testify July 19th before a joint session of the House Select Committee on Aging (Honorable Claude Pepper, M.C., Chairman) and the House Committee on Science and Technology (Honorable Don Fuqua, M.C., Chairman)—subject: Applications of Space Technology for the Elderly and the Handicapped.

I stared at that letter with all the enthusiasm of a bridegroom handed a summons for jury duty. Space technology? Yeah, sure, I was gung-ho for space technology, space travel, spaceships, space exploration, space colonies—anything about space, always have been.

But "applications of space technology for the elderly and the handicapped"? Why not bee culture? Or Estonian folk dancing? Or the three-toed salamander? Tantric Yoga?

I faced up to the problem the way any married man does: "Honey? How do I get out of this?"

"Come clean," she advised me. "Tell them bluntly that you know nothing about the subject. Shall I write a letter for you to sign?"

"It's not that simple."

"Certainly it is. We don't want to go to Washington. *In July?* Let's not be silly."

"You don't have to go."

"You don't think I'd let you go alone, do you? After the time and trouble I've spent keeping you alive? Then let you drop dead on a Washington sidewalk? *Hmmph!* You go—*I* go."

Some hours later I said, "Let's sum it up. We both know that any Congressional committee hearing, no matter how the call reads, has as its real subject 'Money'—who gets it and how much. And we know that the space program is in bad trouble. This joint session may not help—it looks as if it would take a miracle to save the space program—but it *might* help. Some, maybe. The only trouble is that I don't know anything about the subject I'm supposed to discuss."

"So you've said, about twenty times."

"I don't know anything about it *today.* But on July 19th I'm going to be a fully-qualified Expert Witness."

"So I told you, two hours ago."

Ginny and I have our own Baker Street Irregulars. Whether the subject be Chaucer or chalk, pulsars or poisons, we either know the man who knows the most about it, or we know a man who knows the man who knows the most. Within twenty-four hours we had a couple of dozen spaceflight fanatics public-spirited citizens helping us. Seventy-two hours, and information started to trickle in—within a week it was a flood and I was starting to draft my written testimony.

I completed my draft and immediately discarded it; galley proofs had arrived of *Technologies for the Handicapped and the Aged* by Trudy E. Bell, NASA July 1979. This brochure was to be submitted by Dr. Frosch, Administrator of NASA, as his testimony at the same hearing. Trudy Bell had done a beautiful job—one that made 95% of what I had written totally unnecessary.

So I started over.

What follows is condensed and abridged from both my written presentation and my oral testimony:

"Honorable Chairman, ladies, and gentlemen—

"Happy New Year!

"Indeed a happy New Year beginning the 11th year in the Age of Space, greatest era of our race—the *greatest*!—despite gasoline shortages, pollution, overpopulation, inflation, wars and threats of war. 'These too shall pass'—but the stars abide.

"Our race will spread out through space—unlimited room, unlimited energy, unlimited wealth. This is certain.

"But I am not certain that the working language will be English. The people of the United States seem to have suffered a loss of nerve. However, I am limited by the call to a discussion of 'spinoffs' from our space program useful to the aged and the handicapped.

"In all scientific research, the researcher may or may not find what he is looking for—indeed, his hypothesis may be demolished—but he is *certain* to learn something new . . . which may be and often is more important than what he had hoped to learn.

"This is the Principle of Serendipity. It is so invariant that it can be considered an empirically established natural law.

"In space research we always try to do more with less, because today the payload is tightly limited in size and in weight. This means endless research and development to make everything smaller, lighter, foolproof, and fail-proof. It works out that almost everything developed for space can be used in therapy . . . and thereby benefits both the elderly and the handicapped, the two groups requiring the most therapy of all sorts.

"When you reach old age—say 70 and up—it approaches certainty that you will be in some way handicapped. Not necessarily a wheelchair or crutches or a white cane—most handicaps do not show. So all of us are customers for space spinoffs—if not today, then soon."

Witness holds up NASA brochure. "There is no need for me to discuss applications that NASA has already described. But this I must say: NASA's presentation is *extremely* modest; it cites only 46 applications—whereas there are hundreds. Often one bit of research results in 2nd, 3rd, and 4th generations; each generation usually has multiple applications—spinoffs have spinoffs, branching out like a tree. To get a feeling for this, think of the endless applications of Lee DeForest's vacuum tube, Dr. Shockley's transistor.

"Here is a way to spot space-research spinoffs: If it involves microminiaturization of *any* sort, minicomputers, miniaturized long-life power sources, highly reliable microswitches, remotely-controlled manipulators, image enhancers, small and sophisticated robotics or cybernetics, then, *no matter where you find the item,* at a critical point in its development it was part of our space program.

"Examples:

"*Image enhancer:* This magic gadget runs an x-ray or fluoroscope picture through a special computer, does things to it, then puts it back onto the screen. Or stores it for replay. Or both. It can sharpen the contrast, take out 'noise,' remove part of the picture that gets in the way of what you need to see, and do other Wizard-of-Oz stunts.

"This is the wonder toy that took extremely weak digital code signals and turned them into those beautiful, sharp, true-color photographs from the surface of Mars in the Viking program and also brought us the Voyager photographs of Jupiter and its moons.

"I first saw one in 1977 at the Medical School of the University of Arizona—saw them put a long catheter up through a dog's body in order to inject an x-ray-opaque dye into its brain. This does not hurt the dog. More about this later—

"I did not know what an image enhancer was until I saw one demonstrated and did not learn until this year that it came from our space program. Possibly the doctor did not know. M.D.'s can use instruments with no notion that they derive from space research. . . . and a patient usually knows as little about it as did that dog.

"The most ironical thing about our space program is that there are thousands of people alive today who would be dead were it not for some item derived from space research—but are blissfully unaware of the fact—and complain about 'wasting all that money on stupid, useless space stunts when we have so many really important problems to solve right here on Earth.'

"'—all that money—'!

"That sort of thinking would have kept Columbus at home.

"NASA's annual budget wouldn't carry H.E.W. ten days. The entire 10 years of the Moon program works out to slightly *less than five cents per citizen per day.*

"Would you like to be a wheelchair case caught by a hurricane such as that one that failed to swing east and instead hit the Texas and Louisiana coast? That storm was tracked by weather satellite; there was ample warning for anyone who would heed it—plenty of time to evacuate not only wheelchair cases but bed patients.

"A similar storm hit Bangladesh a while back; it too was tracked by satellite. But Bangladesh lacks means to warn its people; many thousands were killed. Here in the United States it would take real effort to *miss* a hurricane warning; even houses with no plumbing have television.

"*Weather satellites* are not spinoff; they *are* space program. But they must be listed because bad weather of any sort is much rougher on the aged and the handicapped than it is on the young and able-bodied.

"*Portable kidney machine:* If a person's kidneys fail, he must 'go on the machine' or die. 'The machine' is a fate so grim that the suicide rate is high. Miniaturization has made it possible to build portable kidney machines. This not only lets the patient lead a fairly normal life, travel and so forth, but also his blood is cleaned steadily as with a normal kidney; he is no longer cumulatively poisoned by his own toxins between his assigned days or nights 'on the machine.'

"This is new. A few have already made the switch but all kidney victims can expect it soon. The suicide rate has dropped markedly—life is again worth living; hope has been restored.

"*Computerized-Axial Tomography,* or CAT, or 'brain scan': They strap you to a table, fasten your skull firmly, duck behind a barrier, and punch a button—then an automatic x-ray machine takes endless pictures, a tiny slice at a time. A special computer synthesizes each series of slices into a picture; a couple of dozen such pictures show the brain in three-dimensional, fine detail, a layer at a time.

"*Doppler Ultrasound Stethoscope:* another microminiaturization spinoff. This instrument is to an ordinary stethoscope as a Rolls-Royce is to a Model-T Ford."

Witness stands up, turns from side to side. "Look at me, please! I'll never be Mr. America; I'll never take part in the Olympics. I've climbed my last mountain.

"But I'm here, I'm alive, I'm functioning.

"Fourteen months ago my brain was dull-normal and getting worse, slipping toward 'human vegetable.' I slept 16 hours a day and wasn't worth a hoot the other 8 hours.

"Were it not for the skill of Dr. Norman Chater, **plus certain spinoffs from the space program,** today I would either be a human vegetable or, if lucky, dead of cerebral stroke.

"My father was *not* lucky; from a similar disorder it took him years to die—*miserable* years. He died before the operation that saved me had been invented, long before there was medical spinoff from space technology.

"Am I elderly? I'm 72. I suffered from a disorder typical of old age, almost never found in the young.

"Am I handicapped? Yes, but my handicaps do not interfere with my work—or my joy in life. Over forty years ago the Navy handed me a piece of paper that pronounced me totally and permanently disabled. I never believed it. That piece of paper wore out; I did not.

"Mrs. Heinlein and I spent 1976 and -77 on blood drives all over this nation. We crisscrossed the country so many times we lost track. It was worthwhile; we recruited several thousand new blood donors—but it was *very* strenuous. By the end of '77 we badly needed a rest, so we took a sea voyage. She and I were walking the beach on Moorea, Tahiti, when I turned my head to look at a mountain peak—and something happened.

"I balanced on my left leg and said, 'Darling, I'm terribly sorry but I think I've had a stroke. Something happened inside my head and now I'm seeing double and my right side feels paralyzed.'

"Mrs. Heinlein half carried me, half dragged me, back to the landing—got me back aboard.

"A shipmate friend, Dr. Armando Fortuna, diagnosed what had happened: a transient ischemic attack, not a stroke. When we reached California, this was confirmed by tests. However a TIA is frequently a prelude to a stroke.

"Remember that spinoff, computerized-axial tomography? That was done to me to rule out brain tumor. No tumor. The neurologist my physician had called in started me on medication to thin my blood as the clinical picture indicated constriction in blood flow to my brain. This treatment was to continue for six months.

But in only two months I was failing so rapidly that I was shipped to the University of California Medical School at San Francisco for further diagnosis. Remember the *image enhancer* and that dog at the University of Arizona? I said that dog was *not* hurt. They did it to me, with *no* anesthesia; it did *not* hurt.

"The catheter goes in down here"—witness points at his right groin—"and goes all the way up and into the aortal arch above the heart. There three very large arteries lead up toward the brain; the catheter was used to shoot x-ray-opaque dye into each, in succession. The procedure took over two hours . . . but I was never bored because the image enhancer included closed-circuit television of the fluoroscopy with the screen right up here"—witness indicates a spot just above and to the left of his head—"above me, where the radiologist and his team, and the patient—*I*—could see it.

"How many people ever get a chance to watch their own hearts beat? Utterly fascinating! I could see my heart beating, see my diaphragm rise and fall, see my lungs expand and contract, see the dye go up into my brain . . . see the network of blood vessels in my brain suddenly spring into sharp relief. It was worth the trip!

"They spotted what was wrong; my left internal carotid was totally blocked. So the left half of my brain was starved for oxygen, as it was receiving only what leaked over from the right side or from the vertebrals where the network interconnected, principally at the Circle of Willis under the brain.

"But this is your speech center"—witness touches left side of skull above ear—"your word processor, the place where a writer does all his work. No wonder I was dopey—could not write, could not study, could not read anything difficult.

"My left internal carotid is still blocked; the stoppage is too high up for surgery. So they sent me to Dr. Chater at Franklin Hospital, who moved my left superficial temporal artery to feed the left side of my brain. This operation is pictured on pages 62 and 63 of the April 1978 *Scientific American,* so I will omit grisly details; if surgery interests you, you can look them up there.

"The procedure is this: Scalp the patient from the left eyebrow, going high and curving down to a spot behind the left ear back of the mastoid. Cut away from the scalp the temporal artery. Saw a circular hole in the skull above the ear. Go inside the brain into the Sylvian fissure, find its main artery, join the two arteries, end to side. The left anterior lobe of my brain is now served by the left *external* carotid via this roundabout bypass. Dr. Chater did the hookup under a microscope with sutures so fine the naked eye can't see them.

"Check by *Doppler ultrasound* to make sure the bypass works, then close the hole in the skull with a plate that has a groove in it for the moved artery. Sew back the scalp—go to lunch. The surgeon has been operating for four hours; he's hungry. (The patient is not.)

"They placed me in a cardiac intensive-care room. When I woke, I found in my room a big screen with dancing lights all over it. Those curves meant nothing to me but were clear as print to the I.C. nurses and to my doctors—such things as EKG, blood pressure, respiration, temperature, brain waves, I don't know what all. The thing was so sensitive that my slightest movement caused one of the curves to spike.

"I mention this gadget because I was *not* wired to it.

"Another space-technology spinoff: This is the way Dr. Berry monitored our astronauts whenever they were out in space.

"Colonel Berry had to have remote monitoring for his astronaut patients. For me it may not have been utterly necessary. But it did mean that I was not cluttered with dozens of wires like a fly caught in a web; the microminiaturized sensors were so small and unobtrusive that I never noticed them—yet the nurses had the full picture every minute, every second.

"Another advantage of telemetered remote monitoring is that more than one terminal can display the signals. My wife tells me that there was one at the nursing supervisor's station. Dr. Chater may have had a terminal in his offices—I don't know. But there can't be any difficulty in remoting a hundred yards or so when the technology was developed for remoting from Luna to Houston, almost a quarter of a million miles.

"*Space spinoff in postoperative care:* a *Doppler ultrasound* stethoscope is an impressive example of microminiaturization. It is enormously more sensitive than an acoustic stethoscope; the gain can be controlled, and, because of its Doppler nature, fluid flow volume and direction can be inferred by a skilled operator. Being ultrasound at extremely high frequency, it is highly directional; an acoustic stethoscope is not.

"It generates a tight beam of ultrasound beyond the range of the human ear. This beam strikes something and bounces back, causing interference beats in the audible range. It behaves much like Doppler radar save that the radiation is ultrasound rather than electromagnetic. Thus it is a *noninvasive* way to explore inside the body without the dangers of x-ray . . . and is able to 'see' soft tissues that x-ray can't see.

"Both characteristics make it especially useful for protecting pregnant mothers and unborn babies. I am not departing from the call; babies unborn and newly born, and mothers at term *must* be classed as 'temporarily but severely handicapped.'

"Doppler ultrasound was used on me before, during, and after surgery.

"After my convalescence I was again examined by *computerized axial tomography.* No abnormalities—other than the new plate in my skull.

"This brain surgery is not itself a spinoff from space technology . . . but note how repeatedly space spinoffs were used on me before, during, and after surgery. This operation is *very* touchy; in the whole world only a handful of surgical teams dare attempt it. Of the thousand-odd of these operations to date, worldwide, Dr. Chater has performed more than 300. His mortality rate is far lower than that of any other team anywhere. This is a tribute to his skill but part of it comes from his attitude: he *always* uses the latest, most sophisticated tools available.

"I was far gone; I needed every edge possible. Several things that tipped the odds in my favor are spinoffs from space technology.

"Was it worthwhile? Yes, even if I had died at one of the four critical points—because sinking into senility while one is still bright enough to realize that one's mental powers are steadily failing is a miserable, no-good way to live. Early last year I was just smart enough to realize that I had *nothing* left to look forward to, nothing whatever. This caused me to be quite willing to 'Go-for-Broke'—get well or die.

"Did it work? I have been out of convalescence about one year, during which I've caught up on two years of technical journals, resumed studying—I have long been convinced that lifelong learning helps to keep one young and happy. True or not, both my wife and I do this. At present I am reviewing symbolic logic, going on into more advanced *n*-dimensional, non-Euclidean geometries, plus another subject quite new to me: Chinese history.

"But I am working, too; I have completed writing a very long novel and am about halfway through another book.

"I feel that I have proved one of two things: either I have fully recovered . . . or a hole in the head is no handicap to a sciencefiction author.

"I must note one spinoff especially important to the aged and the handicapped: *spiritual* spinoff.

"'Man does not live by bread alone.' Any physician will tell you that the most important factor in getting well is the will to live—contrariwise, a terminal patient dies when he gives up the fight.

"I have been in death row three times. The unfailing support of my wife sustained my will to live . . . so here I am. In addition I have believed firmly in space flight for the past sixty-odd years; this has been a permanent incentive to *hang on, hang on!* My wife shares this;

she decided years back to die on the Moon, not here in the smog and the crowds. Now that I am well again I intend to hang in there, lead a disciplined life, stay alive until we can *buy* commercial tickets to the Moon . . . and spend our last days in low-gravity comfort in the Luna Hilton, six levels down in Luna City.

"Foolishness? Everyone in this room is old enough to know by direct experience that today's foolishness is tomorrow's wisdom. I can remember when 'Get a horse!' was considered the height of wit. As may be, *anything* that gives one a strong incentive to live can't be *entirely* foolish.

"I get a flood of mail from my readers; a disproportionate part of it is from the very old and the handicapped. It is impossible to be a fan of my fiction and not be enthusiastic for space travel. Besides, they *tell* me so, explicitly, in writing.

"Examples:

"A college professor, blind from birth. He's never *seen* the the stars; he's never *seen* the Moon. The books he reads and rereads—has read to him by his secretary—are about space travel. He went to a lot of trouble to look me up . . . to discuss our space program.

"A teenage boy, tied to a wheelchair, who wrote to ask me whether or not he could become an astronautical engineer—some 'friend' had told him that it was a silly ambition for a cripple. I assured him that an engineer did not need legs even on Earth's surface, advised him in what courses to take, and referred him to a story by Arthur C. Clarke in which a double amputee, both legs, commands a space station.

"A housewife with epilepsy, *grand mal,* who doesn't expect ever to be able to go out into space . . . but finds her greatest interest in life, her major relief from the tedious routine she must follow, in our space program.

"A very large number of elderly people who wrote to me immediately after the first landing on the Moon, all saying, in effect, that they thanked the Lord that they had been spared long enough to see this great day.

"I could add examples endlessly. Just let me state flatly that my files hold proof that the aged retired, the shut-ins and the disabled of all ages get more spiritual lift out of space flight than does any other definable group of our citizens. For many of them the television screen is their only window on the world; something great and shining and wonderful went out of their lives when the Apollo Moon program ended.

"Even if a space program had no other spinoff, isn't *that* sort worth 5¢ a day?"

FOREWORD

To William Targ

Warning! Truth in advertising requires me to tell you that this volume contains *The Worlds of Robert A. Heinlein*, published 1966. But this new volume is about three times as long. It contains fiction stories that have never before appeared in book form, nonfiction articles not available elsewhere, a 30-year updating on my 1950 prognostications (as well as the 15-year updating that appeared in *The Worlds of R.A.H.*), with the usual weasel-worded excuses as to why I guessed wrong—and (ruffles & flourishes) not one but *two* scenarios for the year 2000, one for people who like happy endings and another for people who can take bad news without a quiver—as long as it happens to somebody else.

On these I will do a really free-swinging job as the probability (by a formula I just now derived) that either I or this soidisant civilization will be extinct by 2000 A.D. approaches 99.92+%. This makes it unlikely that I will again have to explain my mistakes.

But do not assume that *I* will be the one extinct. My great-great-greatgrandfather Lawrence Heinlein died prematurely at the age of ninety-seven, through having carelessly left his cabin one winter morning without his gun—and found a buck deer on the ice of his pond. Lack of his gun did not stop my triple-great-grandfather; this skinful of meat must *not* be allowed to escape. He went out on the ice and bulldogged the buck, quite successfully.

But in throwing the deer my ancestor slipped on the ice, went down, and a point of the buck's rack stabbed between his ribs and pierced his heart.

No doubt it taught him a lesson—it certainly taught *me* one. So far I've beaten the odds three times: continued to live when the official prognosis called for something less active. So I intend to be careful—not chopped down in my prime the way my ancestor was. I shan't bulldog any buck deer, or cross against the lights, or reach barehanded into dark places favored by black widow spiders, or—most especially!—leave my quarters without being adequately armed.

Perhaps the warmest pleasure in life is the knowledge that one has no enemies. The easiest way to achieve this is by outliving them. No action is necessary; time wounds all heels.

In this peaceful crusade I have been surprisingly successful; most of those rascals are dead . . . and three of the survivors are in very poor health. The curve seems to indicate that by late 1984 I won't have an enemy anywhere in the world.

Of course someone else may appoint himself my enemy (all my enemies are self-appointed) but I would not expect such an unlikely event to affect the curve much. There appears to be some unnamed ESP force at work here; the record shows that it is not healthy to hate me.

I don't have anything to do with this. The character can be more than a thousand miles away, with me doing my utter best to follow Sergeant Dogberry's advice; nevertheless it happens: He starts losing weight, suffering from insomnia and from nightmares, headaches, stomach trouble, and, after a bit, he starts hearing voices.

The terminal stages vary greatly. Anyhow, they are unpleasant and I should not be writing about such things as I am supposed to be writing a blurb that will persuade you to buy this book despite the fact that nearly a third of it is copy you may have seen before.

Aside from this foreword the items in this book are arranged in the order in which written, each with a comment as to how and why it was written (money, usually, but also— Well, money)—then a bridging comment telling what I was writing or doing between that item and the next.

The span is forty years. But these are not my memoirs of those four decades. The writing business is not such as to evoke amusing memoirs (yes, I do mean you and you and you and especially *you*). A writer spends his professional time in solitary confinement, refusing to accept telephone calls and declining to see visitors, surrounded by a dreary forest of reference books and somewhat-organized papers. The high point of his day is the breathless excitement of waiting for the postman. (The low point is usually immediately thereafter.)

How can one write entertaining memoirs about such an occupation? Answer: By writing about what this scrivener did when *not* writing, or by resorting to fiction, or both. Usually both.

I could write entertaining memoirs about things I did when not writing. I shan't do so because a) I hope those incidents have been forgotten, or b) I hope that any not forgotten are covered by the statute of limitations.

Meanwhile I hope you enjoy this. The fiction is plainly marked fiction; the nonfiction is as truthful as I can make it—and here and there, tucked into space that would otherwise be blank are anecdotes and trivia ranging from edifying to outrageous.

Each copy is guaranteed—or double your money back—to be printed on genuine paper of enough pages to hold the covers apart.

—R.A.H., 1980

HOW TO BE A SURVIVOR

The Art of Staying Alive in the Atomic Age

Thought about your life insurance lately?

Wait a minute—sit back down! We don't want to sell you any insurance.

Let's put it another way: How's your pioneer blood these days? Reflexes in fine shape? Muscle tone good? Or do you take a taxi to go six blocks?

How are you at catching rabbits? The old recipe goes, "First, catch the rabbit—" Suppose your supper depended on catching a rabbit? Then on building a fire without matches? Then on cooking it? What kind of shape will you be in after the corner delicatessen is atomized?

When a committee of Senators asked Dr. J. Robert Oppenheimer whether or not a single attack on the United States could kill forty million people, he testified, "I am afraid it is true."

This is not an article about making the atom bomb safe for democracy. This is an article *about you*—and how you can avoid being one of the forty million knocked off in the first attack in World War III. How, if worst comes to worst, you can live through the next war, survive the aftermath, and build a new life.

If you have been reading the newspapers you are aware that World War III, if it ever comes, is expected to start with an all-out surprise attack by long-distance atomic bombing on the cities of America. General Marshall's final report included this assumption, General Arnold has warned us against such an attack, General Spaatz has described it and told us that it is almost impossible to ward it off if it ever comes. Innumerable scientists, especially the boys who built the A-bomb, have warned us of it.

From the newspapers you may also have gathered that world affairs are not in the best of shape—the Balkans, India, Palestine, Iran, Argentina, Spain, China, The East Indies, etc., etc.—and the UNO does not seem as yet to have a stranglehold on all of the problems that could lead to another conflict.

Maybe so, maybe not—time will tell. Maybe we will form a real World State strong enough to control the atom bomb. If you are sure there will never be war again, don't let me waste your time. But if you think it possible that another Hitler or Tojo might get hold of the atomic bomb and want to try his luck, then bend an ear and we'll talk about how you and your kids can live through it. We'll start with the grisly assumption that the war will come fast and hard, when it comes, killing forty million or so at once, destroying the major cities, wrecking most of our industry and utterly disorganizing the rest. We will assume a complete breakdown of government and communication which will throw the survivors—that's you, chum!—on their own as completely as ever was Dan'l Boone.

No government—remember that. The United States will cease to be a fact except in the historical sense. You will be on your own, with no one to tell you what to do and no policeman on the corner to turn to for protection. And you will be surrounded with dangerous carnivores, worse than the grizzlies Daniel Boone tackled—the two-legged kind.

Perhaps we had better justify the assumption of complete breakdown in government. It might not happen, but, if the new Hitler has sense enough to write *Mein Kampf,* or even to read it as a textbook, he will do his very best to destroy and demoralize us by destroying our government—and his best could be quite efficient. If he wants to achieve political breakdown in his victim, Washington, D.C., will be his prime target, the fortyeight state capitals his secondary targets, and communication centers such as Kansas City his tertiary targets. The results should be roughly comparable to the effect on a man's organization when his head is chopped off.

Therefore, in this bad dream we are having, let us assume no government, no orders from Washington, no fireside chats, no reassurances. You won't be able to write to your congressman, because he, poor devil!, is marked for the kill. You can live through it, he can't. He will be radioactive dust. His profession is so hazardous that there is no need for him to study up on how to snare rabbits.

But *you* should—if you are smart, you can live through it.

Now as to methods—there is just one known way to avoid being killed by an atomic bomb. The formula is very simple:

Don't be there when it goes off!

Survival methods in the atomic age can be divided into two headings, strategical and tactical. The first or strategical aspect is entirely concerned with how not to be where the bomb is; the second, tactical part has to do with how to keep yourself and your family alive if you live through the destruction of the cities and the government.

Strategy first—the simplest way to insure long life for yourself and family is to move to Honduras or some other small and nonindustrialized country, establish yourself there, and quit worrying. It is most unlikely that such places will be subjected to atomic bombardment; if war comes, they will move into the economic and political sphere of the winner, to be sure, but probably without bloodshed, since resistance would be so obviously futile.

However, you probably cannot afford, or feel that you can't afford, any move as drastic as that. (Whether or not you can in truth afford it is a moot point, to be settled by your own notion of the degree of danger. The pre-War refugees from Nazi Germany could not "afford" to flee, either, but events proved the wisdom of doing so. There is an old

Chinese adage, "In the course of a long life a wise man will be prepared to abandon his baggage several times." It has never been more true than it is today.)

There are several moves open to you which are less drastic. If you live on a farm or in a small village, several miles—fifty is a good figure—from the nearest large city, rail junction, power dam, auto factory, or other likely military target, strategy largely takes care of itself. If you are blasted, it will probably be an accident, a rocket gone wild, or something equally unforeseeable. If you are not in such a location, you had better make some plans.

Just a moment—a gentleman in the back row has a question. A little louder please. He asks, "Isn't it true that the government is planning to disperse the cities so we will be safe from atomic bombs?"

I don't know—is it? The only figure I have heard mentioned so far is $250,000,000,000. Quite aside from the question of whether or not large scale dispersion can be made effective, there is still the question as to whether or not Congress would appropriate a quarter of a trillion dollars in peacetime for any purpose. That is a political question, beyond the scope of this discussion. We are concerned here with how you, unassisted, with your two hands, your brain, and your ability to plan ahead, can keep yourself alive during and after any possible Next War.

If you have to live in a large city or other target area, your strategical planning has to be a good bit more detailed, alert, and shifty. You need an emergency home, perhaps an abandoned farm picked up cheaply or a cabin built on government land. What it is depends on the part of the country you live in and how much money you can put into it, but it should be chosen with a view to the possibilities it offers of eating off the country—fish, game, garden plot—and it should be near enough for you to reach it on one tank of gasoline. If the tank in your car is too small, have a special one built, or keep enough cans of reserve permanently in the trunk of your car. Your car should also be equipped with a survival kit, but that comes under tactics.

Having selected and equipped your emergency base, you must then, if you are to live in a target area, keep your ear to the ground and your eyes open with respect to world affairs. *There will be no time to get out after rockets are launched.* You will have to outguess events. This is a tricky assignment at best and is the principal reason why it is much better to live in the country in the first place, but you stand a fair chance of accomplishing it if you do not insist on being blindly optimistic and can overcome a natural reluctance to make a clean break with your past—business, home, clubs, friends, church—when it becomes evident that the storm clouds are gathering. Despite the tragic debacle at Pearl Harbor, quite a number of people, laymen among them, knew that a war with Japan was coming. If you think you can learn to spot the signs of trouble long enough in advance to jump, you may get away with living on the spot with the X mark.

Let us suppose that you were quick-witted, far sighted, and fast on your feet; you brought yourself and your family safely through the bombing and have them somewhere out in the country, away from the radioactive areas that were targets a short time before. The countryside is swarming with survivors from the edges of the bombed areas, survivors who are hungry, desperate, some of them armed, all of them free of the civilizing restrictions of organized living. Enemy troops, moving in to occupy, may already be present or may be dropping in from the skies any day.

How, on that day, will you feed and protect yourself and your family?

The tactical preparations for survival after the debacle fall mainly into three groups. First is the overhaul of your own bodily assets, which includes everything from joining the YMCA, to get rid of that paunch and increase your wind and endurance, to such things as getting typhoid and cholera shots, having that appendix out, and keeping your teeth in the best shape possible. If you wear glasses, you will need several pairs against the day when there will be no opticians in practice. Second is the acquisition of various materials and tools which you will be unable to make or grow in a sudden, synthetic stone age—items such as a pickax or a burning glass, for example, will be worth considerably more than two college degrees or a diamond bracelet. Third is training in various fundamental pioneer skills, not only how to snare and cook rabbits, but such things as where and when to plant potatoes, how to tell edible fungi from deadly toadstools without trying them on Junior, and how to walk silently.

All these things are necessary, but more important, much more important, is the acquiring of a survival point of view, the spiritual orientation which will enable you to face hardship, danger, cold, and hunger without losing your zest and courage and sense of humor. If you think it is going to be too hard to be worthwhile, if you can't face the prospect of coming back to the ruins of your cabin, burned down by drunken looters, other than with the quiet determination to build another, then don't bother to start. Move to a target area and wait for the end. It does not take any special courage or skill to accept the death that moves like lightning. You won't even have the long walk the steers have to make to get from the stockyard pens to the slaughterhouse.

But if your ancestors still move in your bones, you will know that it is worthwhile, just as they did. "The cowards never started and the weaklings died on the way." That was the spirit that crossed the plains, and such was the spirit of every emigrant who left Europe. There is good blood in your veins, *compadre!*

It is not possible to tell exactly what to do to prepare yourself best to survive, even if this were a book instead of a short article, for the details must depend on the nature of the countryside you must rely on, your opportunities for planning and preparing, the numbers, ages and sex of your dependents if any, your present skills, talents, and physical condition, and whether or not you are at present dispersed from target areas or must plan for such dispersal. But the principles under which you can make your plans and the easiest means by which to determine them can be indicated.

Start out by borrowing your son's copy of the *Boy Scout Manual.* It is a practical book of the sort of lore you will need. If you can't borrow it because he is not a member of the Scouts, send him down at once and make him join up. Then make him study. Get him busy on those merit badges—woodcraft, cooking, archery, carpentry. *Somebody* is going to have to make that fire without matches, if that rabbit is ever to be cooked and eaten. See to it that he learns how, from experts. Then make him teach you.

Can you fell a tree? Can you trim a stone? Do you know where to dig a cesspool? Where and how to dig a well? Can you pull a tooth? Can you shoot a rifle accurately and economically? Can you spot tularemia (we are back to that ubiquitous rabbit again!) in cleaning a rabbit? Do you know the rudiments of farming? Given simple tools, could you build a log, or adobe, or rammed-earth, or native-stone cabin from materials at hand and have it be weather-tight, varmint-proof, and reasonably comfortable?

You can't learn all the basic manual trades in your spare time in a limited number of years but you can acquire a jackleg but adequate knowledge of the more important ones, in the time we have left.

But how much time have we?

All we can do is estimate. How long will it be before other nations have the atomic bomb? Nobody knows—one estimate from the men who made it was "two to five years." Dr. Vannevar Bush spoke of "five to fifteen years" while another expert, equally distinguished, mentioned "five or ten years." Major General Leslie Groves, the atom general, thinks it will be a long time.

Let us settle on five years as a reasonable minimum working time. Of course, even if another nation, unfriendly to us, solved the production problems of atomic weapons in that length of time, there still might not be a war for a number of years, nor would there necessarily ever be one. However, since we don't know what world conditions will be like in five years, let's play it safe; let's try to be ready for it by 1950.

Four or five years is none too long to turn a specialized, soft, city dweller into a generalized, hardened pioneer. However, it is likely that you will find that you are enjoying it. It will be an interesting business and there is a deep satisfaction in learning how to do things with your own hands.

First get that *Scout Manual.* Look over that list of merit badges. Try to figure out what skills you are likely to need, what ones you now have, and what ones you need to study up on. The Manual will lead you in time to other books. Ernest Thompson Seton's *Two Little Savages* is full of ideas and suggestions.

Presently you will find that there are handbooks of various trades you have not time to master; books which contain information you could look up in an emergency if you have had the forethought to buy the book and hide it away in your out-of-town base. There are books which show how to build fireplaces, giving the exact dimensions of reflector, throat, ledge, and flue. You may not remember such details; being able to look them up may save you from a winter in a smoke-filled cabin. If there is any greater domestic curse than a smoking fireplace, I can't recall it, unless it be the common cold.

There are little handbooks which show, in colored pictures, the edible mushrooms and their inedible cousins. It is possible to live quite well on practically nothing but fungi, with comparatively little work; they exist in such abundance and variety.

You will need a medical reference book, selected with the advice of a wise and imaginative medical man. Tell him why you want it. Besides that, the best first-aid and nursing instruction you can get will not be too much. Before you are through with this subject you will find yourself selecting drugs, equipment, and supplies to be stored against the darkness, in your base as well as a lesser supply to go into the survival kit you keep in your automobile.

What goes into that survival kit, anyhow? You will have to decide; you won't take any present advice in any case. By the time you get to it you will think, quite correctly, that you are the best judge. But the contents of the survival kits supplied our aviators in this latest war will be very illuminating. The contents varied greatly, depending on climate and nature of mission—from pemmican to quinine, fish hooks to maps.

What to put in your cabin is still more difficult to state definitely. To start with, you might obtain a Sears Roebuck or Montgomery Ward catalog and go through it, item by item. Ask yourself "Do I have to have this?" then from the list that produces ask yourself "Could I make this item, or a substitute, in a pinch?"

If shoes wear out, it is possible to make moccasins—although shoes should be hoarded in preference to any other item of clothing. But you can't—unless you are Superman—make an ax. You will need an ax.

You will need certain drugs. Better be liberal here.

Salt is difficult to obtain, inland.

It is difficult to reject the idea of hoarding canned goods. A few hundred dollars worth, carefully selected, could supplement the diet of your family to the point of luxury for several years. It might save you from starvation, or the cannibalism that shamed the Donner Party, during your first winter of the Dark Ages, and it could certainly alleviate some of the sugar hunger you are sure to feel under most primitive conditions. But it is a very great risk to have canned goods. If you have them, you will be one of the hated rich if anybody finds out about them. We are assuming that there will be no government to protect you. To have canned goods—and have it known by anyone outside your own household—is to invite assassination. If you do not believe that a man will commit murder for one can of tomatoes, then you have never been hungry.

If you have canned goods, open them when the windows are shuttered and bury the cans. Resist the temptation to advertise your wealth by using the empty tins as receptacles.

Don't forget a can opener—two can openers.

You will have a rifle, high-powered and with telescopic sights, but you won't use it much. Cartridges are nearly irreplaceable. A deer or a man should be about the limit of the list of your targets . . . a deer when you need meat; a man when hiding or running is not enough.

That brings us to another subject and the most interesting of all. We have not talked much about the enemy, have we? And yet he was there, from the start. It was his atom bombs which reduced you to living off the country and performing your own amputations and accouchements. If you have laid your plans carefully, you won't see much of him for quite a while; this is a very, very big country. Where you are hidden out there never were very many people at any time; the chances of occupation forces combing all of the valleys, canyons, and hills of our back country in less than several years is negligible. It is entirely conceivable that an enemy could conquer or destroy our country, as a state, in twenty minutes, with atom bomb and rocket. Yet, when his occupation forces move in, they will be almost lost in this great continent. He may not find you for years.

There is your chance. It has been proved time and again, by the Fighting French, the recalcitrant Irish, the deathless Poles, yes and by our own Apache and Yaqui Indians, that you cannot conquer a free man; you can only kill him.

After the immediate problems of the belly, comes the Underground!

You'll need your rifle. You will need knives. You will need dynamite and fuses. You will need to know how to turn them into grenades. You must learn how to harry the enemy in the dark, how to turn his conquest into a mockery, too expensive to exploit. Oh, it can be done, it can be done! Once he *occupies,* his temporary advantage of the surprise attack with the atom bomb is over, for once his troops are scattered among you, *he cannot use the atom bomb.*

Then is your day. Then is the time for the neighborhood cell, the mountain hideout, the blow in the night. Yes, and then is the time for the martyr to freedom, the men and women who die painfully, with sealed lips.

Can we then win our freedom back? There is no way of telling. History has some strange quirks. It was a conflict between England and France that gave us our freedom in the first place. A quarrel in enemy high places, a young hopeful feeling his oats and anxious to displace the original dictator, might give us unexpected opportunity, opportunity we could exploit if we were ready.

There are ways to study for that day, too. There are books, many of them, which you may read to learn how other people have done it. One such book is Tom Wintringham's *New Ways of War.* It is almost a blueprint of what to do to make an invader wish he had stayed at home. It is available in a 25-cent Penguin-Infantry Journal edition. You can study up and become quite deadly, even though 4-F, or fifty.

If you plan for it, you can survive. If you study and plan and are ready to organize when the time comes, you can hope not only to survive but to play a part in winning back lost freedoms. General George Washington once quoted Scripture to describe what we were fighting for then—a time when "everyone shall sit in safety under his own vine and figtree, and none shall make him afraid!"

It is worth planning for.

THE HAPPY DAYS AHEAD

"It does not pay a prophet to be too specific."
—L. Sprague de Camp
"You never get rich peddling gloom."
—William Lindsay Gresham

The late Bill Gresham was, before consumption forced him into fiction writing, a carnie mentalist of great skill. He could give a cold reading that would scare the pants off a marble statue. In six words he summarized the secret of success as a fortuneteller. Always tell the mark what he wants to hear. He will love you for it, happily pay you, then forgive and forget when your cheerful prediction fails to come true—and always come back for more.

Stockbrokers stay in business this way; their tips are no better than guesses but they are *not* peddling dividends; they are peddling happiness. Millions of priests and preachers have used this formula, promising eternal bliss in exchange for following, or at least giving lip service to, some short and tolerable rules, plus a variable cash fee not too steep for the customer's purse . . . and have continued to make this formula work *without ever in all the years producing even one client who had actually received the promised prize.*

Then how do churches stay in business? Because, in talking about "Pie in the Sky, By and By," they offer happiness and peace of mind *right here on Earth.* When Karl Marx said, "Religion is the opium of the people," he was not being cynical or sarcastic; he was being correctly descriptive. In the middle nineteenth century opium was the *only* relief from intolerable pain; Karl Marx was stating that faith in a happy religion made the lives of the people of the abyss tolerable.

Sprague de Camp is Grand Master of practically everything and probably the most learned of all living practitioners of science fiction and fantasy. I heard those words of wisdom from him before I wrote the 1950 version of "Pandora' Box." So why didn't I listen? Three reasons: 1) money; 2) money; and 3) I thought I could get away with it during my lifetime for predictions attributed to 2000 A.D. I never expected to live that long; I had strong reasons to expect to die young. But I seem to have more lives than a cat; it may be necessary to kill me by driving a steak through my heart (sirloin by choice), then bury me at a crossroads.

Still, I could have gotten away with it if I had stuck to predictions that could not mature before 2000 A.D. Take the two where I *really* flopped, *#5* and #16. *In both cases I named a specific year short of 2000 A.D.* Had I not ignored Mr. de Camp's warning, I could look bland and murmur, "Wait and see. Don't be impatient," on all in which the prediction does not look as promising in 1980 as it did in 1950.

Had I heeded a wise man on 2 out of 19 I could today, by sheer brass, claim to be batting a thousand.

I have made some successful predictions. One is "The Crazy Years." (Take a look out your window. Or at your morning paper.) Another is the water bed. Some joker tried to patent the water bed to shut out competition, and discovered that he could not because it was in the public domain, having been described in detail in *Stranger in a Strange Land.* It had been mentioned in stories of mine as far back as 1941 and several times after that, but not until *Stranger* did the mechanics of a scene require describing how it worked.

It was *not* the first man to build water beds who tried to patent it. The first man in the field knew where it came from; he sent me one, free and freight prepaid, with a telegram naming his firm as the "Share-Water Bed Company." Q.E.D.

Our house has no place to set up a water bed. None. So that bed is still in storage a couple of hundred yards from our main house. I've owned a water bed from the time they first came on market—but have never slept in one.

I designed the water bed during years as a bed patient in the middle thirties: a pump to control water-level, side supports to permit one to float rather than simply lying on a not-very-soft water-filled mattress, thermostatic control of temperature, safety interfaces to avoid all possibility of electrical shock, waterproof box to make a leak no more important than a leaky hot water bottle rather than a domestic disaster, calculation of floor loads (important!), internal rubber mattress, and lighting, reading, and eating arrangements—an attempt to design the perfect hospital bed by one who had spent too *damned* much time in hospital beds.

Nothing about it was eligible for patent—nothing new—unless a sharp patent lawyer could persuade the examiners that a working assemblage enabling a person to sleep on water involved that—how does the law describe it?—"flash of inspiration" transcending former art. But I never thought of trying; I simply wanted to build one—but at that time I could not have afforded a custom-made soapbox.

But I know exactly where I got the idea. In 1931, a few days after the radio-compass incident described in the afterword to "Searchlight," I was ordered to Fort Clayton, Canal Zone, to fire in Fleet Rifle & Pistol Matches. During that vacation-with-pay I often returned from Panama City after taps, when all was quiet. There was a large swimming pool near the post gate used by the Navy and our camp was well separated from the Army regiment barracked there.

I would stop, strip naked, and have a swim—nonreg (no life guards) but no one around, and regulations are made to be broken.

Full moon occurred about the middle of Fleet Matches—and I am one of those oddies who cannot sink, even in fresh water (which this was). The water was blood warm, there was no noise louder than night jungle sounds, the Moon blazed overhead, and I would lie back with every muscle relaxed and stare at it—fall into it—wonder whether we would get there in my lifetime. Sometimes I dozed off.

Eventually I would climb out, wipe my feet dry with a hanky, pull on shoes, hang clothes over my arm, and walk to my tent in the dark. I don't recall ever meeting anyone but it couldn't matter—dark, all male, surrounded by armed sentries, and responsible myself only to a

Marine Corps officer junior to me but my TDY boss as team captain—and he did not give a hoot what I did as long as I racked a high score on the range (and I did, largely because my coach was a small wiry Marine sergeant nicknamed "Deacon"—who reappears as survival teacher in *Tunnel in the Sky*).

Some years later, bothered by bed sores and with every joint aching no matter what position I twisted into, I thought often of the Sybaritic comfort of floating in blood-warm water at night in Panama—and wished that it could be done for bed patients . . . and eventually figured out how to do it, all details, long before I was well enough to make working drawings.

But 1) I never expected one to be built; 2) never thought of them (except for myself) other than as hospital beds; 3) never expected them to be widely used by a fair percentage of the public; 4) and never dreamed that they would someday be advertised by motels for romantic-exotic-erotic weekends along with X-rated films on closed-circuit TV.

By stacking the cards, I'm about to follow the advice of both Bill Gresham and Sprague de Camp. First, I will paint a gloomy picture of what our future may be. Second, I'll offer a cheerful scenario of how wonderful it *could* be. I can afford to be specific as each scenario will deny everything said in the other one (de Camp), and I can risk great gloom in the first because I'll play you out with music at the end (Gresham).

GLOOM, WOE, AND DISASTER—There are increasing pathological trends in our culture that show us headed down the chute to self-destruction. These trends do *not* require that we be conquered—wait a bit and we will fall into the lap of whichever power cares to occupy us. I'll list some of these trends and illustrate (rather than prove) what I mean. But it would be tediously depressing to pile up convincing proof—I'm not running for office. I *do have* proof, on file right in this room. I started clipping and filing by categories on trends as early as 1930 and my "youngest" file was started in 1945.

Span of time is important; the 3-legged stool of understanding is held up by **history, languages,** and **mathematics.** Equipped with these three you can learn anything you want to learn. But if you lack *any one* of them you are just another ignorant peasant with dung on your boots.

A few years ago I was visited by an astronomer, young and quite brilliant. He claimed to be a longtime reader of my fiction and his conversation proved it. I was telling him about a time I needed a synergistic orbit from Earth to a 24-hour station; I told him what story it was in, he was familiar with the scene, mentioned having read the book in grammar school.

This orbit is similar in appearance to cometary interplanet transfer but is in fact a series of compromises in order to arrive in step with the space station; elapsed time is an unsmooth integral not to be found in Hudson's Manual but it can be solved by the methods used on Siacci empiricals for atmosphere ballistics: numerical integration.

I'm married to a woman who knows more math, history, and languages than I do. This should teach me humility (and sometimes does, for a few minutes). Her brain is a great help to me professionally. I was telling this young scientist how we obtained yards of butcher paper, then each of us worked three days, independently, solved the problem and checked each other—then the answer disappeared into *one* line *of one* paragraph (*Space Cadet*) but the effort had been worthwhile as it controlled what I could do dramatically in that sequence.

Doctor Whoosis said, "But *why* didn't you just shove it through a computer?"

I blinked at him. Then said slowly, gently, "My dear boy—" (I don't usually call Ph.D.'s in hardcore sciences "My dear boy"—they impress me. But this was a special case.)

"My dear boy . . . this was *1947*."

It took him some seconds to get it, then he blushed.

Age is not an accomplishment and youth is no sin. This young man was (is) brilliant, skilled in mathematics, had picked German and Russian for his doctorate. At the time I met him he seemed to lack feeling for historical span . . . but, if true, I suspect that it began to itch him and he made up that lack either formally or by reading. Come to think of it, much of my own knowledge of history derives not from history courses but from history of astronomy, of war and military art, and of mathematics, as my formal history study stopped with Alexander and resumed with Prince Henry the Navigator. But to understand the history of those three subjects, you *must* branch out into general history.

Span of Time—the Decline of Education

My father never went to college. He attended high school in a southern Missouri town of 3000+, then attended a private 2-year academy roughly analogous to junior college today, except that it was *very* small—had to be; a day school, and Missouri had no paved roads.

Here are some of the subjects he studied in back-country 19th century schools: Latin, Greek, physics (natural philosophy), French, geometry, algebra, 1st year calculus, bookkeeping, American history, World history, chemistry, geology.

Twentyeight years later I attended a much larger city high school. I took Latin and French but Greek was not offered; I took physics and chemistry but geology was not offered. I took geometry and algebra but calculus was not offered. I took American history and ancient history but no comprehensive history course was offered. Anyone wishing comprehensive history could take (each a one-year 5-hrs/wk course) ancient history, medieval history, modern European history, and American history—and note that the available courses ignored all of Asia, all of South America, all of Africa except ancient Egypt, and touched Canada and Mexico solely with respect to our wars with each.

I've had to repair what I missed with a combination of travel and private study . . . and must admit that I did not tackle Chinese history in depth until this year. My training in history was so spotty that it was not until I went to the Naval Academy and saw captured battle flags that I learned that we fought Korea some *eighty years* earlier than the mess we are still trying to clean up.

From my father's textbook I know that the world history course he studied was not detailed (how could it be?) but at least it treated the world as *round;* it did not ignore three fourths of our planet.

Now, let me report what I've seen, heard, looked up, clipped out of newspapers and elsewhere, and read in books such as *Why Johnny Can't Read*, *The Blackboard Jungle*, *etc.*

Colorado Springs, our home until 1965, in 1960 offered first-year Latin—but that was all. Caesar, Cicero, Virgil—Who dat?

Latin is not taught in the high schools of Santa Cruz County. From oral reports and clippings I note that it is not taught in most high schools across the country.

"Why this emphasis on Latin? It's a dead language!" Brother, as with jazz, in the words of a great artist, "If you have to ask, you ain't never goin' to find out." A person who knows *only* his own language does not even know his *own* language; epistemology necessitates knowing more than one human language. Besides that sharp edge, Latin is a giant help in *all* the sciences—and so is Greek, so I studied it on my own.

A friend of mine, now a dean in a state university, was a tenured professor of history—but got riffed when history was eliminated from the required subjects for a bachelor's degree. His courses (American history) are still offered but the one or two who sign up, he tutors; the overhead of a classroom cannot be justified.

A recent *Wall Street Journal* story described the bloodthirsty job hunting that goes on at the annual meeting of the Modern Languages Association; modern languages—even English—are being deemphasized right across the country; there are more professors in MLA than there are jobs.

I mentioned elsewhere the straightA student on a scholarship who did not know the relations between weeks, months, and years. This is not uncommon; high school and college students in this country usually can't do simple arithmetic without using a pocket calculator. (I mean with pencil on paper; to ask one to do *mental* arithmetic causes jaws to drop—say 17 x 34, done mentally. How? Answer: Chuck away the 34 but remember it. $(10 + 7)^2$ is 289, obviously. Double it: 2(300 – 11), or 578.

But my father would have given the answer at once, as his country grammar school a century ago required *perfect* memorizing of multiplication tables *through 20* x *20 = 400* . . . so his ciphering the above would have been merely the doubling of a number already known (289)—or 578. He might have done it again by another route to check it: (68 + 510)—but his hesitation would not have been noticeable.

Was my father a mathematician? Not at all. Am I? Hell, no! This is the simplest sort of kitchen arithmetic, the sort *that high school students can no longer do*—at least in Santa Cruz.

If they don't study math and languages and history, what *do* they study? **(Nota Bene!** Any student can learn the truly tough subjects *on almost any campus if he/she wishes*—the professors and books and labs are there. But the student must *want* to.)

But if that student does not want to learn anything requiring brain sweat, most U.S. campuses will babysit him 4 years, then hand him a baccalaureate for not burning down the library. That girl in Colorado Springs who studied Latin—but no classic Latin—got a "general" bachelor's degree at the University of Colorado in 1964. I attended her graduation, asked what she had majored in. No major. What had she studied? Nothing, really, it turned out—and, sure enough, she's as ignorant today as she was in high school.

Santa Cruz has an enormous, lavish 2-year college and also a campus of the University of California, degree granting through Ph.D. level. But, since math and languages and history are not required, let's see how they fill the other classrooms.

The University of California (all campuses) is classed as a "tough school." It is paralleled by a State University system with lower entrance requirements, and this is paralleled by local junior colleges (*never* called "junior") that accept any warm body.

UCSC was planned as an elite school ("The Oxford of the West") but falling enrollment made it necessary to accept any applicant who can qualify for the University of California as a whole; therefore UCSC now typifies the "statewide campus." Entrance can be by examination (usually College Entrance Examination Boards) or by high school certificate. Either way, admission requires a certain spread—2 years of math, 2 of a modern language, 1 of a natural science, 1 of American history, 3 years of English—and a level of performance that translates as B+. There are two additional requirements: English composition, and American History and Institutions. The second requirement acknowledges that some high schools do not require American history; UCSC permits an otherwise acceptable applicant to make up this deficiency (with credit) after admission.

The first additional requirement, English composition, can be met by written examination such as CEEB, or by transferring *college* credits considered equivalent, or, lacking either of these, by passing an examination given at UCSC at the start of each quarter.

The above looks middlin' good on the surface. College requirements from high school have been watered down somewhat (or more than somewhat) but that B+ average as a requirement looks good . . . *if* high schools are teaching what they taught two and three generations ago. The rules limit admission to the upper 8% of California high school graduates (out-of-state applicants must meet slightly higher requirements).

8%— So 92% fall by the wayside. These 8% are the intellectual elite of young adults of the biggest, richest, and most lavishly educated state in the Union.

Those examinations for the English-composition requirement: How can anyone fail who has had 3 years of high school English and averages B+ across the board?

If he fails to qualify, he may enter but must take at once (no credit) "Subject A"—better known as "Bonehead English."

"Bonehead English" must be repeated, if necessary, until passed. To be forced to take this no-credit course does *not* mean that the victim splits an occasional infinitive, sometimes has a dangling modifier, or a failure in agreement or case—he can even get away with such atrocities as "—like I say—."

It means that he has reached the Groves of Academe unable to express himself by writing in the English language.

It means that his command of his native language does not equal that of a 12-year-old country grammar school graduate of ninety years ago. It means that he verges on subliterate but that his record is such in other ways that the University will tutor him (no credit and for a fee) rather than turn him away.

But, since these students are the upper 8% and each has had not less than three years of high school English, it follows that only the exceptionally unfortunate student needs "Bonehead English." That's right, isn't it? Each one is eighteen years old, old enough to vote, old enough to contract or to marry without consulting parents, old enough to hang for murder, old enough to have children (and some do); all have had 12 years of schooling including 11 years of English, 3 of them in high school.

(Stipulated: California has special cases to whom English is not native language. But such a person who winds up in that upper 8% is usually—I'm tempted to say "always"—fully literate in English.)

So here we have the cream of California's young adults; each has learned to read and write and spell and has been taught the basics of English during eight years in grammar school, and has polished this by not less than three years of English in high school—and also has had at least two years of a second language, a drill that vastly illuminates the subject of grammar even though grasp of the second language may be imperfect.

It stands to reason that *very* few applicants need "Bonehead English." Yes?

No!

I have just checked. The new class at UCSC is "about 50%" in Bonehead English—and this is normal—normal right across California—and California is no worse than most of the states.

8% off the top—

Half of this elite 8% must take "Bonehead English."

The prosecution rests.

This scandal must be charged to grammar and high school teachers . . . many of whom are not themselves literate (I know!)—but are not personally to blame, *as we are now in the second generation of illiteracy.* The blind lead the blind.

But what happens after this child (sorry—young adult citizen) enters UCSC?

I TELL YOU THREE TIMES I TELL YOU THREE TIMES I TELL YOU THREE TIMES: A student who *wants* an education can get one at UCSC in a number of very difficult subjects, plus a broad general education.

I ask you never to forget this while we see how one can slide through, never do any real work, never learn anything solid, and still receive a bachelor of arts degree from the prestigious University of California. Although I offer examples from the campus I know best, I assume conclusively that this can be done throughout the state, as it is one statewide university operating under one set of rules.

Some guidelines apply to any campus: Don't pick a medical school or an engineering school. Don't pick a natural science that requires difficult mathematics. (A subject called "science" that does *not* require difficult mathematics usually is "science" in the sense that "Christian Science" is science—in its widest sense "science" simply means "knowledge" and anyone may use the word for any subject . . . but shun the subjects that can't be understood without mindstretching math.)

Try to get a stupid but good-natured adviser. There are plenty around, especially in subjects in which to get a no-sweat degree; Sturgeon's Law applies to professors as well as to other categories.

For a bachelor's degree:

1) You must spend the equivalent of one academic year in acquiring "breadth"—but wait till you see the goodies!

2) You must take the equivalent of one full academic year in your major subject in upper division courses, plus prerequisite lower division courses. Your 4-year program you must rationalize to your adviser as making sense for your major ("Doctor, I picked *that* course because it *is* so far from my major—for perspective. I was getting too narrow." He'll beam approvingly . . . or you had better look for a stupider adviser).

3) Quite a lot of time will be spent off campus but counted toward your degree. This should be fun, but it can range from hard labor at sea, to counting noses and asking snoopy questions of "ethnics" (excuse, please!), to time in Europe or Hong Kong, et al., where you are in danger of learning something new and useful even if you don't try.

4) You will be encouraged to take interdisciplinary majors and are invited (urged) to invent and justify unheard-of new lines of study. For this you need the talent of a used-car salesman as *any* aggregation of courses can be sold as a logical pattern if your "new" subject considers the many complex relationships between three or four or more old and orthodox fields. Careful here! If you are smart enough to put this over, you may find yourself not only *earning* a baccalaureate but in fact doing original work worthy of a Ph.D. (You won't get it.)

5) You must have at least one upper-division seminar. Pick one in which the staff leader likes your body odor and you like his. ("I do not like thee, Dr. Fell; the reason why I cannot tell—") But you've at least two years in which to learn which professors in your subject are simpatico, and which ones to avoid at any cost.

6) You must write a 10,000 word thesis on your chosen nonsubject and may have to defend it orally. If you can't write 10,000 words of bull on a bull subject, you've made a mistake—you may have to *work* for a living.

The rules above allow plenty of elbowroom; at least three out of four courses can be elective and the remainder elective in part, from a long menu. We are still talking *solely* about nonmathematical subjects. If you are after a Ph.D. in astronomy, UCSC is a wonderful place to get one . . . but you will start by getting a degree in physics including the toughest of mathematics, and will study also chemistry, geology, technical photography, computer science—and will resent any time not leading toward the ultra-interdisciplinary subject lumped under the deceptively simple word "astronomy."

Breadth—the humanities, natural science, and social science—1/3 in each, total 3/3 or one academic year, but spread as suits you over the years. Classically "the humanities" are defined as literature, philosophy, and art—but history has been added since it stopped being required in college and became "social studies" in secondary schools. "Natural science" does not necessarily mean what it says—it can be a "nonalcoholic gin"; see below. "Social science" means that grab bag of studies in which answers are matters of opinion.

Courses satisfying "breadth" requirements

Humanities

Literature and Politics—political & moral choices in literature

Philosophy of the Self

Philosophy of History in the Prose and Poetry of W. B. Yeats

Art and the Perceptual Process

The Fortunes of Faust

Science and the American Culture (satisfies both the Humanities requirement and the American History and Institutions requirement *without* teaching *any* science or *any* basic American History. A companion course, *Science and Pressure Politics,* satisfies both the Social Sciences requirement and the American History and Institutions requirement while teaching still less; it concentrates on the post-World-War-II period and concerns scientists as lobbyists and their own interactions [rows] with Congress and the President. Highly recommended as a way to avoid learning American history or very much social "science.")

American Country Music—Whee! You don't play it, you listen.

Man and the Cosmos—philosophy, sorta. Not science.

Science Fiction (I refrain from comment.)

The Visual Arts—"What, if any, are the critical and artistic foundations for judgment in the visual arts?"—exact quotation from catalog.

Mysticism—that's what it says.

(The above list is incomplete.)

Natural Science requirement

General Astronomy—no mathematics required

Marine Biology—no mathematics required

Sound, Music, and Tonal Properties of Musical Instruments—neither math nor music required for this one!

Seminar: Darwin's Explanation

Mathematical Ideas—for nonmathematicians; requires only that high school math you must have to enter.

The Phenomenon of Man—"—examine the question of whether there remains any meaning to human values." (Oh, the pity of it all!)

Physical Geography: Climate

The Social "Sciences" requirement

Any course in Anthropology—many have no prereq.

Introduction to Art Education—You don't have to *make* art; you study how to teach it.

Music and the Enlightenment—no technical knowledge of music required. This is a discussion of the effect of music on philosophical, religious, and social ideas, late 18th–early 19th centuries. That is what it says—and it counts as "social science."

The Novel of Adultery—and this, too, counts as "social science." I don't mind anyone studying this subject or teaching it—but I object to its being done on my (your, our) tax money. (P.S. The same bloke teaches science fiction. He doesn't *write* science fiction; I don't know what his qualifications are in this other field.)

Human Sexuality

Cultural Roots for Verbal and Visual Expression—a fancy name of still another "creative writing" class with frills—the students are taught how to draw out "other culture" pupils. So it says.

All the 30-odd "*Community Studies*" courses qualify as "social science," but I found myself awed by these two: *Politics and Violence,* which studies, among other things, "political assassination as sacrifice" and *Leisure and Recreation in the Urban Community* ("Bread and Circuses").

Again, listing must remain incomplete; I picked those below as intriguing:

Seminar: Evil and the Devil in the Hindu Tradition.

Science and Pressure Politics—already mentioned on page 433 as the course that qualifies both as social "science" and as American History and Institutions while teaching an utter minimum about each. The blind man now has hold of the elephant's tail.

The Political Socialization of La Raza—another double header, social "science" and American History and Institutions. It covers greater time span (from 1900 rather than from 1945) but it's like comparing cheese and chalk to guess which one is narrower in scope in either category.

The name of this game is to plan a course involving minimum effort and minimum learning while "earning" a degree under the rules of the nation's largest and most prestigious state university.

To take care of "breadth" and also the American history your high school did not require I recommend *Science and Pressure Politics, The Phenomenon of Man,* and *American Country Music.* These three get you home free without learning *any* math, history, or language that you did not already know . . . and without sullying your mind with science.

You must pick a major . . . but it must *not* involve mathematics, history, or actually being able to *read* a second language. This rules out *all* natural sciences (this campus's greatest strength).

Anthropology? You would learn something in spite of yourself; you'd get interested. Art? Better not major in it without major talent. Economics can be difficult, but also and worse, you may incline toward the Chicago or the Austrian school and not realize it until your (Keynesian or Marxist) instructor has failed you with a big black mark against your name. Philosophy? Easy and lots of fun and absolutely guaranteed not to teach you anything while loosening up your mind. In more than twenty-five centuries of effort *not one* basic problem of philosophy has *ever* been solved . . . but the efforts to solve them are most amusing. The same goes for comparative religion as a major: You won't actually *learn* anything you can sink your teeth into . . . but you'll be vastly entertained—if the Human Comedy entertains you. It does me.

Psychology, Sociology, Politics, and Community Studies involve not only risk of learning something—not much, but *something*—and each is likely to involve real work, tedious and lengthy.

To play this game and win, with the highest score, it's Hobson's choice: American literature. I assume that you did not have to take Bonehead English and that you can type. In a school that has no school of education (UCSC has none) majoring in English Literature is the obvious way to loaf through four years. It will be necessary to cater to the whims of professors who know no more than you do about anything that matters . . . but catering to your mentors is necessary in any subject not ruled by mathematics.

Have you noticed that professors of English and/or American Literature are not expected to be proficient in the art they profess to teach? Medicine is taught by M.D.'s on living patients, civil engineering is taught by men who in fact have built bridges that did not fall; law is taught by lawyers; music is taught by musicians; mathematics is taught by mathematicians—and so on.

But is—for example—the American Novel taught by American novelists?

Yes. Occasionally. But so seldom that the exceptions stand out. John Barth. John Erskine fifty years ago. Several sciencefiction writers almost all of whom were selling writers long before they took the King's Shilling. A corporal's guard in our whole country out of battalions of English profs.

For a Ph.D. in American/English literature a candidate is not expected to *write* literature; he is expected to *criticize* it.

Can you imagine a man being awarded an M.D. for writing a *criticism* of some great physician without ever himself having learned to remove an appendix or to diagnose *Herpes zoster*? And for that dissertation then be hired to *teach* therapy to medical students?

There is, of course, a reason for this nonsense. The rewards to a competent novelist are so much greater than the salaries of professors of English at even our top schools that once he/she learns this racket, teaching holds no charms.

There are exceptions—successful storytellers who *like* to teach so well that they keep their jobs and write only during summers, vacations, evenings, weekends, sabbaticals. I know a few—emphasis on "few." But most selling wordsmiths are lazy, contrary, and so opposed to any fixed regime that they will do *anything*—even meet a deadline—rather than accept a job.

Most professors of English *can't* write publishable novels . . . and many of them can't write nonfiction prose very well—certainly not with the style and distinction and grace—and content—of Professor of Biology Thomas H. Huxley. Or Professor of Astronomy Sir Fred Hoyle. Or Professor of Physics John R. Pierce. Most Professors of English get published, when they do, by university presses or in professional quarterlies. But fight it out for cash against *Playboy* and Travis McGee? They can't and they don't!

But if you are careful not to rub their noses in this embarrassing fact and pay respectful attention to their opinions even about (ugh!) "creative writing," they will help you slide through to a painless baccalaureate.

You still have time for many electives and will need them for your required hours-units-courses; here are some fun-filled ones that will teach you almost nothing:

The Fortunes of Faust

Mysticism

The Search for a New Life Style

The American Dilemma—Are "all men equal"?

Enology—history, biology, and chemistry of wine-making and wine appreciation. This one will teach you something but it's too good to miss.

Western Occultism: Magic, Myth, and Heresy.

There is an entire college organized for fun and games ("aesthetic enrichment"). It offers courses for credit but you'll be able to afford noncredit activity as well in your lazyman's course—and *anything* can be turned into credit by some sincere selling to your adviser and/or Academic Committee. I have already listed nine of its courses but must add:

Popular Culture

—plus clubs or "guilds" for gardening, photography, filmmedia, printing, pottery, silkscreening, orchestra, jazz, *etc.*

Related are *Theater Arts*. These courses give credit, including:

Films of Fantasy and Imagination—fantasy, horror, SF, *etc.* (!)
Seminar on Films
Filmmaking
History and Aesthetics of Silent Cinema
History and Aesthetics of Cinema since Sound

Introduction to World Cinema

Sitting and looking at movies can surely be justified for an English major. Movies and television use writers—as little as possible, it's true. But somewhat; the linkage is there.

Enjoy yourself while it lasts. These dinosaurs are on their way to extinction.

The 2-year "warm body" campus is even more lavish than UCSC. It is a good trade school for some things—e.g., dental assistant. But it offers a smorgasbord of fun—Symbolism of the Tarot, Intermediate Contract Bridge, Folk Guitar, Quilting, Horseshoeing, Chinese Cooking, Hearst Castle Tours, Modern Jazz, Taoism, Hatha Yoga Asanas, Aikido, Polarity Therapy, Mime, Raku, Bicycling, Belly Dancing, Shiatsu Massage, Armenian Cuisine, Revelation and Prophecy, Cake Art, Life Insurance Sales Techniques, Sexuality and Spirituality, Home Bread Baking, Ecuadorian Backstrap Weaving, The Tao of Physics, and lots, lots more! One of the newest courses is "The Anthropology of Science Fiction" and I'm still trying to figure that out.

I have no objection to any of this . . . but why should this kindergarten be paid for by *taxes*? "Bread and Circuses."

I first started noticing the decline of education through mail from readers. I have saved mail from readers for forty years. Shortly after World War Two I noticed that letters from the youngest were not written but hand-printed. By the middle fifties deterioration in handwriting and in spelling became very noticeable. By today a letter from a youngster in grammar school *or in high school* is usually difficult to read and sometimes illegible—penmanship atrocious (*pencil*manship—nine out of ten are in soft pencil, with well-smudged pages), spelling unique, grammar an arcane art.

Most youngsters have not been taught how to fold 8½" x 11" paper for the two standard sizes of envelopes intended for that standard sheet.

Then such defects began to show up among college students. Apparently "Bonehead English" (taught everywhere today, so I hear) is not sufficient to repair the failure of grammar and high school teachers *who themselves in most cases were not adequately taught.*

I saw sharply this progressive deterioration because part of my mail comes from abroad, especially Canada, the United Kingdom, the Scandinavian countries, and Japan. A letter from any part of the Commonwealth is invariably neat, legible, grammatical, correct in spelling, and polite. The same applies to letters from Scandinavian countries. (Teenagers of Copenhagen usually speak and write English better than most teenagers of Santa Cruz.) Letters from Japan are invariably neat—but the syntax is sometimes odd. I have one young correspondent in Tokyo who has been writing steadily these past four years. The handwriting in the first letter was almost stylebook perfect but I could hardly understand the phrasing; now, four years later, the handwriting looks the same but command of grammar, syntax, and rhetoric is excellent, with only an occasional odd choice in wording giving an exotic flavor.

Our public schools no longer give good value. We remain strong in science and engineering but even students in those subjects are handicapped by failures of our primary and secondary schools and by cutback in funding of research both public and private. Our great decline in education is alone enough to destroy this country . . . but I offer no solutions because the only solutions I think would work are so drastic as to be incredible.

Span of Time—Decline in Patriotism and in the Quality of Our Armed Forces

The high school I attended (1919–24) was an early experiment in the junior and senior high school method. The last year of grammar school was joined with the freshman class as "junior high" while the sophomores, juniors, and seniors were "senior high."

There was a company of junior ROTC in junior high and two companies in senior high. Military training gave no credit and was not compulsory; it was neither pushed nor discouraged. A boy took it or not, as suited him and his parents. Some of the subfreshman (aet. ca. 13 an.) were barely big enough to tote a Springfield rifle.

Kansas City had a regiment of Federalized National Guard, with one authorized drill per week, 3 hours each Wednesday evening. For this a private was paid 69¢, a PFC got a dollar, and a corporal got big money—$1.18.

The required & paid weekly drill was not all, as about half of the regiment showed up on Sundays at the "Military Country Club"—acres of raw wood lot until the regiment turned it into rifle range, club house, stables, *etc.* No pay for Sundays. Two weeks encampment per year, with pay. For most of the regiment, this was their only vacation, two weeks then being standard.

That regiment ran about 96% authorized strength.

About 1921 Congress authorized the CMTC, Citizens Military Training Corps. It proved very popular. A month of summer training in camp at an Army post, continued through 4 years, could (if a candidate's grades were satisfactory) result in certification for commission in the reserve. Civilians submitted to military discipline in CMTC but were not subject to court martial. Offenders could be sent home or turned over to civilian police, depending on the offense. There were few offenses.

CMTC candidates got 3¢ per mile to and from their homes, no other money.

In 1925 I was appointed midshipman. There were 51 qualified applicants trying for that one appointment.

240 of my class graduated; 130 fell by the wayside. *One* of that 130 resigned voluntarily; all the others resigned involuntarily, most of them plebe year for failure in academics (usually mathematics), the others were requested to resign over the next three years for academic, physical, or other reasons. A few resigned graduation day through having failed the final physical examination for commissioning. Three more served about one year in the Fleet, then resigned—but these three volunteered after the attack on Pearl Harbor. 28 of the 129 who left the service involuntarily managed to get back on active duty in World War Two.

So with four exceptions all of my class stayed in the Navy *as long as the Navy would have them.* About 25% were killed in line of duty or died later of wounds. Neither at the Academy nor in the Fleet did I ever hear a midshipman or officer talk about resigning. While it is likely that some thought about it, all discussion tacitly carried the assumption that the Navy was our life, the Fleet our home, and that we would leave only feet first or when put out to pasture as too old.

Enlisted men: When I entered the Fleet, *before* the Crash of '29 and about a year before unemployment became a problem, Navy recruiting offices were turning down 19 out of 20 volunteers; the Army was turning down 5 out of 6. The reenlistment rate was high; the desertion rate almost too small to count.

Span of Time—Today in the Armed Forces

I have said repeatedly that I am opposed to conscription at any time, peace or war, for moral reasons beyond argument. For the rest of this I will try to keep my personal feelings out of the discussion—as I did in the rosy picture painted above. I reported *facts,* not my emotions.

I will not review details showing that the USSR is today militarily stronger than we are as the matter has been discussed endlessly in news media, in Congress, and in professional journals. The public discussion today concedes the military superiority of the USSR and centers on *how much* they are ahead of us, and what should be done about it. The details of this debate are of supreme importance as **the most expensive thing in the world is a second-best military establishment,** good but not good enough to win. At the moment the three-cornered standoff is saving us from that silly way to die . . . but I cannot predict how long this stalemate will last as key factors are not under our control, and neither our government nor our citizens seem willing to accept guns instead of butter on the scale required to make us too strong for anyone to risk attacking us. Polls seem to show that a controlling number of voters think that we are already spending too much on our Armed Forces.

What I set forth below comes primarily from an article by Richard A. Gabriel, Associate Professor of Politics, St. Anselm's College, Manchester, New Hampshire, author of *Crisis in Command*. I lack personal experience with Army conditions today but what Dr. Gabriel says about them matches what I have heard from other sources and what I have read (I belong to all three associations—Army, Navy, Air Force—plus the Naval Institute and the Retired Officers Association; I get much data secondhand but no longer see it with my own eyes, hear it with my own ears).

Readers with personal experience in Korea, Viet Nam, and in the Services anywhere since the end of the Viet Nam debacle, I urge to write and tell me what you know that I don't, especially on points in which I am seriously mistaken.

Summarized from "The Slow Dying of the American Army," Dr. Richard A. Gabriel in *Gallery* magazine, June 1979, p. 41 et seq.:

Concerning the All Volunteer Force (AVF): Early this year the Pentagon admitted that all services had failed to meet quotas.

30% of all Army volunteers are discharged for offenses during first enlistment. Of the 70 per 100 left, 26 do not reenlist. The desertion rates are the highest in history . . . and this fact is partly covered up by using administrative discharges (—i.e., "You're fired!") rather than courts martial and punishment—if the deserter turns up. But no effort is made to find him.

According to Dr. Gabriel, citing General George S. Blanchard and others, hard-drug use (heroin, cocaine, angel dust—not marijuana) is greater than ever, especially in Europe, with estimates from a low of 10% to a high of 64%. Marijuana is ignored—but let me add that a man stoned out of his mind on grass is not one I want on my flank in combat.

Category 3B and 4 (ranging down from dull to mentally retarded) make up 59% of Army volunteers . . . in a day when privates handle very complex and sophisticated weapons and machinery. Add to this that the mix is changing so that a typical private might be Chicano or Puerto Rican, the typical sergeant a Black, the typical officer "Anglo." And that officers are transferred with great frequency and enlisted men with considerable frequency and you have a situation in which esprit de corps *cannot* be developed (an outfit without esprit de corps is not an army unit; it is an armed mob—R.A.H.).

Today we have more general officers than we did in World War Two. Our ratio of officers to enlisted men is more than twice as high as that of successful armies in the past. But an officer is not with his troops long enough to be "the Old Man"—he is a "manager," not a leader of men.

Dr. Gabriel concludes: "The most basic aspect is the need to reinstate the draft."

I disagree.

My disagreement is not on moral grounds. Forget that I ever voiced opposition to slave soldiers; think of me as Old Blood-and-Guts willing to use any means whatever to win.

Reinstating the draft would *not* get us out of trouble, even with the changes Dr. Gabriel suggests to make the draft "fair."

As everyone knows, we were in the frying pan; shifting to AVF, instead of producing an efficient professional army, put us into the fire. Dr. Gabriel urges that we climb back into the frying pan—but with improvements: a national lottery with no deferments whatever for any reason.

I can't disagree with the even-steven rule . . . but my reason for thinking that Dr. Gabriel's solution will not work is this:

A lottery, even meticulously fair, *cannot* make a man willing to charge a machinegun nest in the face of almost certain death. That sort of drive comes from emotional sources. Esprit de corps and patriotism *cannot* be drawn in a lottery.

Conscription works (among free men) only when it is not needed. I have seen two world wars; we used the draft in each . . . but in each case it was a means of straightening out the manpower situation; it was *not* needed to make men fight. Both wars were popular.

Since then we have had two non-Wars—Korea and Nam—in "peacetime" and using conscript troops. **And each non-War was a scandalous disaster.**

I don't have a neat solution to offer. If the American people have lost their willingness to fight and die for their country, the defect cannot be cured by conscription. Unless this emotional condition changes (and I do not know how to change it), we are whipped no matter what weapons we build. It could be overnight, or it could continue to be a long slow slide downhill over many years—ten, twenty, thirty. But the outcome is the same. Unless *something* renews the spirit this country once had, we are in the terminal stages of decay; history is ending for us.

Our foreign masters might graciously let us keep our flag, even our national name. But "the Land of the Free and the Home of the Brave" will be dead.

Time Span—Inflation

The Winter of '23–'24 I paid a street vendor 5¢ for a five billion mark German note and I paid too much; 5,000,000,000 DM was worth a trifle over 1¢. A bit later it was worth nothing.

In 1955 at the foot of the Acropolis I bought a small marble replica of the Venus of Melos for 10,000 drachma. I wasn't cheated; that was 3.50 USA.

There are the British pound, the Turkish lira, the Italian lira, the Mexican peso, and several others; all mean one pound of silver. Look up "exchange" and "commodities" in your newspaper; grab your pocket calculator and see how much each is inflated.

When I was a child of four or five my brothers and I used great stacks of hundred-dollar bills as play money. Confederate—

After two centuries, "Not worth a continental," still means "worthless." Memory is long for the damage done by inflation.

Before paper "money" was invented, inflation was accomplished by adding base metal to silver and/or gold while retaining the name of the coin. By this means the Roman denarius was devalued to zero during the first three centuries A.D. But inflation did not start with Caesar Augustus. In the early days of the Republic before the Punic Wars the cash unit was the libra (libra = lb.—pound = 273 grams, or about 60% of our pound avoirdupois, 454 grams). That's too large a unit for daily retail use; it was divided into 12 unciae (ounces).

A "lb." of silver was called an "as." 1/12 of that, struck as coinage, made efficient currency. Now comes war and inflation—

Eventually the "as"—once a pound of silver—was so debased that it amounted to a penny, more or less. Augustus, by decree, went back on a silver/gold standard and created the denarius, 3.87 grams of fine silver. He made 25 denarii equal in value to one aureus (7.74 grams of gold), or a ratio of 12.5 to one. ("Free and unlimited coinage of silver at a ratio of sixteen to one!" The Great Commoner and the august Emperor had similar notions about hard currency.)

One Augustan denarius equalled in gold at today's London fix ($385/troy ounce) a nominal $3.83, or about 3/10 of a gram of gold. This tells us nothing about purchasing power; it simply says that the Augustan denarius was a solid silver coin almost the size and weight of the solid silver quarter we used to have before the government foisted on us those sandwich things. How much olive oil or meal that would buy in Rome around 1 A.D. can be estimated from surviving records—but all the gold in Rome could not buy an aspirin tablet or a paper of matches. No way to compare. And hard money was not supplemented by printed money, bank checks, and transactions that take place entirely inside computers—but I can't go into how those phenomena affect purchasing power without writing a book twice as long as this one on fiscal theory (which I am quite willing to do but nobody would buy it).

What Augustus did was to stabilize Rome's money by defining it in terms of two commodities, each intrinsically valuable, each stable in supply, each almost indestructible, and he defined also the legal ratio between the two coinages—an effort to circumvent Gresham's Law, unknown then but Augustus appears to have had a gut feeling for it. (Not Bill Gresham—the other one. Thomas Gresham.) But a bimetallic standard has its problems; the free economy ratio tends to drift away from the legal ratio, and Gresham's Law begins to work. But this happens very slowly with hard money and is not the disaster that printing-press inflation is, or the debasing of hard money.

Caesar Augustus died in 14 A.D.

His corpse was hardly cold before the vultures got to work. Tiberius, Caligula, Claudius, Nero—even Claudius did nothing to stop the robbery. Titus attempted an Augustan return to honest money in 80 A.D. but he died in September the following year; his successor was a disaster even as Caesars go.

"Put not your trust in Princes." Debasement of the currency continued under every Caesar for the next two centuries. Diocletian (reign: 294–305) inherited a worthless denarius; he returned Rome to the bimetallic standard at a level barely below that of Augustus. But he increased enormously the bureaucracy, instituted the harshest of taxation to pay for his "reforms," and decreed price-fixing—which worked just as it always does.

On his retirement (not assassination[!]) debasement was resumed while taxes stayed high, and Rome was on the skids. The decline and fall of the denarius and of Rome paralleled each other.

I'm tempted to discuss France's incredible inflation and collapse thereof during the French Revolution (and three more French inflations since then), and the inflations of several other countries in other centuries. But they are monotonously alike and differ from debasement primarily in the fact that the invention of paper "money" permits the corruption of legal tender to get utterly out of hand before the people notice it. In Germany in the early twenties people used to take wheelbarrows to the grocery store—not to fetch back groceries but to carry money to the grocer. But the early stages of disastrous inflation feel like "prosperity." Wages and profits go up, old debts are easier to pay off, business booms.

It is not until later that most people notice that prices and taxes have gone up faster than wages and profits, and that it is getting harder and harder to make ends meet.

There is a strong emotional feeling that "a dollar is a dollar." (Hitler called it, "Mark is Mark!") But you can reexamine it in terms of prices on bread, or how many minutes to earn a dollar. And don't forget taxes! If you aren't working at least the first three months of each year to pay taxes before you can keep one dollar for yourself, then you are on welfare, one way or another. You may not think you are taxed that much—paycheck deductions and hidden taxes are extracted under anesthesia. Try dividing the Federal Budget by the number of wage earners *not on the public payroll,* then take a stab at where you fit in. Don't forget the same process for state, county, and city. There are Makers, Takers, and Fakers, no fourth category, and today the Takers and the Fakers outnumber (and outvote) the Makers.

Today it takes more dollars each year to service the National Debt than the total budget for the last and most expensive year of the Korean War. I am not going to state here the amount of our National Debt. If you have not heard it recently, you wouldn't believe me. If you don't know, telephone your Congressman and ask; he has a local office near you. If the telephone information service can't (won't) tell you, the city room of *any* newspaper does know his number.

Our National Debt will *never* be paid. We are beyond the point of no return. Inflation will continue and get worse . . . and the elderly on fixed incomes and the young adults trying to start families will continue to bear the brunt.

Every congressman, every senator, knows precisely what causes inflation . . . but can't (won't) support the drastic reforms to stop it because it could (and probably would) cost him his job. I have no solution and only one piece of advice:

Buy a wheelbarrow.

The Age of Unreason

Having been reared in the most bigoted of Bible Belt fundamentalism in which every word of the King James version of the Bible is the literal word of God—then having broken loose at thirteen when I first laid hands on *The Origin of Species* and *The Descent of Man* —I should have been unsurprised by the anti-intellectual and anti-science ground swell in this country.

I knew that our American temperament, practical as sharp tools on one side, was never more than three quarters of an inch from mindless hysteria on the other side. I *knew* this—my first long story was "If This Goes On—", a yarn based on the assumption that my compatriots were capable of throwing away their dearly-bought liberties to submit to a crude and ridiculous religious dictatorship.

(In forty years of letters about that story no one has ever criticized this assumption; I infer that I am not alone in believing it.)

I had read much about the Ku Klux Klan during the Tragic Era, talked with many who had experienced it, then experienced its nationwide recrudescence in the early 1920's. I had seen damfoolishness from dance marathons to flagpole sitters, and had made considerable study of crowd behavior and mass delusions. I had noted, rather casually, the initial slow growth of anti-science-&-intellect-ism.

Yet the durned thing shocked me.

Let me list some signs:

a) I CHING;

b) Back-to-nature cults;

c) The collapse of basic education;

d) The current respectability of natal horological astrology among "intelligentsia"—e.g. professors, N.Y. lit'rary people, etc.;

e) "Experts" on nuclear power and nuclear weapons who know nothing whatever of mathematical physics and are smug in admitting it;

f) "Experts" on the ecology of northern Alaska who have never been there and are not mathematically equipped to analyse a problem in ecology;

g) People who watch television several hours a day and derive all their opinions therefrom—and expound them;

h) People who watch television several hours a day;

i) The return of creationism—"Equal time for Yahweh";

j) The return of witchcraft.

The mindless yahoos, people who think linearly like a savage instead of inductively or deductively, and people who used to be respectful to learned opinion or at least kept quiet, now are aggressively on the attack. Facts and logic don't count; their intuition is the source of "truth."

If any item on the above list strikes you as rational, I won't debate it with you; you are part of the problem.

But I will illustrate what I mean in categories where I think I might be misunderstood.

a) **I CHING**—easier than "reading the augurs" but with nothing else to recommend it. Chinese fortune cookies are just as as accurate—and you get to eat the cookie. Nevertheless this bit of oriental nonsense is treated with solemn seriousness by many "educated" people. It is popular enough to make profitable the sale of books, equipment, magazine articles, and personal instruction. Paralleling I CHING is the widespread use of Tarot cards. Fortunetelling by cards used to be a playful parlor game, a mating rite—a nubile girl limited by the vocabulary and public manners of the Mauve Decade could convey to a rutty young male almost any message by how she chose to "read his fortune"—with no impropriety. But neither he nor she took the cards seriously.

Tarot cards formerly were used only by Gypsy or fake-Gypsy fortunetellers; they were not an article of commerce, were not easy to find. Today they are as easy to buy as liquor during prohibition, and also books on their "interpretation." Reading the Tarot is taken with deep seriousness by a dismaying number of people—having the Hanging Man turn up can cause great anguish.

b) **Back-to-nature cults:** I do *not* mean nudist resorts or "liberated" beaches. The growing realization that human bodies are not obscene is a sane, healthy counter trend in our crazy culture. By back-to-nature cults I mean people who band together to "return to the land" to grow their own food without pesticides, without artificial fertilizers, without power machinery, self-reliant in all ways . . . but with no comprehension that a spading fork implies coal mines, iron ore, blast furnaces, steel mills, factories, etc., that any building more complex than a log cabin or a sod house implies a building-materials industry, *etc.*

If all of us tried to go back-to-nature, most of us would starve rather quickly. These back-to-nature freaks can't do arithmetic.

c) The collapse of basic education—no need to repeat.

d) **Natal horological astrology**—Baseline: fifty-odd years ago astrology was commonly regarded as a ridiculous former superstition, one all but a tiny minority had outgrown. It is now the orthodoxy of many, possibly a majority. This pathological change parallels the decay of public education.

Stipulated: Ancient astrologers were scientists in being able to predict certain aspects of descriptive astronomy such as eclipses, positions of the sun, moon, and naked-eye planets, *etc.* Whether or not they believed the fortunetelling they supplied to their kings, patrons, or clients is irrelevant. The test of a science is its ability to predict; in the cited phenomena the Chaldean priests (for example) performed remarkable feats of prediction with handcrafted naked-eye instruments.

It has long been known that Sol is the heat engine that controls our weather. Recently, with the discovery of solar wind, the Van Allen belts, et al., we have become aware of previously unsuspected variables affecting us and our weather, and successful predictions are being made empirically—no satisfactory theory.

"What sign were you born under?"—I don't recall having heard that question until sometime after World War Two. Today it is almost impossible to attend a social gathering (including parties made up almost solely of university staff and spouses) without being asked that question or hearing it asked of someone else.

Today natal horological astrology is so widely accepted that those who believe in it take it for granted that anyone they meet believes in it, too—if you don't, you're some sort of a nut. I don't know what percentage of the population believe in natal horological astrology (sorry about that clumsy expression but I wish to limit this precisely to the notion that the exact time, date, latitude, and longitude of your birth and the pattern of the Sun, Moon, and planets with respect to the Zodiac at that exact time all constitute a factor affecting your life comparable in importance to your genetic inheritance and your rearing and education)—I don't know the percentage of True Believers but it is high enough that newspaper editors will omit any feature or secondary news rather than leave out the daily horoscope.

Or possibly *more* important than heredity and environment in the minds of True Believers since it is seriously alleged that this natal heavenly pattern *affects every day of your life*—good days for new business ventures—a bad day to start a trip—and so forth, endlessly.

The test of a science is its capacity to make correct predictions. Possibly the most respected astrologer in America is a lady who not only has her daily column in most of the largest newspapers but also annually publishes predictions for the coming year.

For ten years I clipped her annual predictions, filed them. She is highly recommended and I think she is sincere; I intended to give her every possible benefit of doubt.

I hold in my hand her predictions for 1974 dated Sunday January 13, 1974:

Here are some highlights: ". . . Nixon . . . will ride out the Watergate storm . . . will survive both the impeachment ordeal and the pressures to resign . . . will go down in history as a great president . . . will fix the responsibility for Pearl Harbor" (vindicating Kimmel and Short) . . . "in . . . 1978 . . . the cure for cancer will be acknowledged by the medical world . . . end the long search." (1974) "The dollar will be enormously strengthened as the balance of payments reflects the self-sufficiency in oil production." "The trouble in Ireland will continue to be a tragic situation *until 1978*." (Italics added—R.A.H.) "Willy Brandt" (will be reelected) "and be in office for quite some time to come. He will go on to fantastic recognition about the middle of 1978." (On 6 May 1974 Brandt resigned during a spy scandal.) She makes many other predictions either too far in the future to check or too vaguely worded. I have omitted her many predictions about Gerald Ford because they all depend on his serving out the term as vice president.

You can check the above in the files of most large newspapers.

e) & f)—no comment needed.

g) & h) need no comment except to note that they are overlapping but not identical categories—and I should add "People who allow their children to watch television several hours a day." (Television, like the automobile, is a development widely predicted . . . but its major consequences *never* predicted.)

i) **The return of creationism—**If it suits you to believe that Yahweh created the universe in the fashion related in Genesis, I won't argue it. But I don't have to respect your belief and I do not think that legislation requiring that the Biblical version be included in public school textbooks is either constitutional or fair. How about Ormuzd? Ouranos? Odin? There is an unnumbered throng of religions, each with its creation myth—all different. Shall one of them be taught as having the status of a scientific hypothesis merely because the members of the religion subscribing to it can drum up a majority at the polls, or organize a pressure group at a state capital? This is tyranny by the mob inflicted on minorities in defiance of the Bill of Rights.

Revelation has no place in a science textbook; it belongs under religious studies. Cosmogony is the most difficult and least satisfactory branch of astronomy; cosmologists would be the first to agree. But, damn it; they're *trying*!—on the evidence as it becomes available, by logical methodology, and their hypotheses are constantly subjected to pitiless criticism by their informed equals.

They should not have to surrender time on their platform, space in their textbooks, to purveyors of ancient myths supported only by a claim of "divine revelation."

If almost everyone believed in Yahweh and Genesis, and less than one in a million U.S. citizens believe in Brahma the Creator, it would not change the constitutional aspect. *Neither* belongs in a science textbook in a tax-supported school. But if Yahweh is there, Brahma should be. And how about that Eskimo Creator with the unusually unsavory methods? We have a large number of Eskimo citizens.

j) **The return of witchcraft—**It used to be assumed that Southern California had almost a monopoly on cults. No longer. (Cult vs. religion—I am indebted to L. Sprague de Camp for this definition of the difference. A "religion" is a faith one is born into; a "cult" is a faith an adult joins voluntarily. "Cult" is often used as a slur by a member of an older faith to disparage a newer faith. But this quickly leads to contradictions. In the 1st century A.D. the Christians were an upstart cult both to the Sanhedrin and to the Roman priests. "Cult" is also used as a slur on a faith with "weird ideas" and "weird practices." But this can cause you to bite your tail even more quickly than the other. "Weird" by whose standards?

(Mr. de Camp's distinction implies something about a mature and presumably sane adult becoming a proselyte in a major and long-established faith, such as Islam or Shintoism or the Church of England . . . but the important thing it implies is that a person born into, let us say, the Presbyterian Church is not being odd or unreasonable if he remains in it all his life despite having lost all faith; he's merely being pragmatic. His wife and kids are there; he feels that church is a good influence on the kids, many of his friends are there. It's a comfortable habit, one carrying with it a degree of prestige in the community.

(But if he changes into a saffron robe and shaves his pate, then goes dancing down the street, shouting, "Hare Krishna!" he won't keep his Chevrolet dealership very long. Theology has nothing to do with it.)

One of the symptoms of this Age of Unreason, anti-science and anti-intellect, in the United States is the very prominent increase in new cults. We've never been without them. 19th Century New England used to breed them like flies. Then it was Southern California's turn. Now they seem to spring up anywhere and also are readily imported from abroad. Zen Buddhism has been here so long that it is usually treated with respect . . . but still so short a time (1950) that few American adults not of Japanese ancestry can claim to have been born into it. Ancient in Japan, it is still a cult *here*—e.g., Alan Watts (1915–1973), who moved from Roman Catholic priest to Episcopal priest to Zen priest. I doubt that there is any count on American Zen Buddhists but it is significant that both "satori" and "koan" were assimilated words in all four standard U.S. dictionaries only 16 years after Zen Buddhism penetrated the non-Japanese population.

And there are the Moonies and the Church of Scientology and that strange group that went to South America and committed suicide en masse and the followers of that fat boy from India and—look around you. Check your telephone book. *I express no opinion on the tenets of any of these;* I simply note that, since World War Two, Americans have been leaving their "orthodox" churches in droves and joining churches new in this country.

Witchcraft is not new and never quite died out. But it is effectively new to most of its adherents here today because of the enormous increase in numbers of witches. ("Warlock" is insulting, "Wizard" barely acceptable and considered gauche, "Witch" is the correct term both male and female. The religion is usually called either "the Old Religion" or "the Craft" rather than witchcraft.)

The Craft is by its nature underground; witches cannot forget the hangings in Salem, the burnings in Germany, the fact that the injunction, "Thou shalt not suffer a witch to live" (Exodus XXII, 18) has usually been carried out whenever the Old Religion surfaced. Even during this resurgence only four covens have come to my attention and, not being a witch myself, I have never attended an esbat (easier to enter a tyled lodge!).

The Craft is *not* Devil worship and it is *not* Black Mass but both of the latter have enjoyed some increase in recent years.

If witchcraft has not come to your attention, search any large book store; note how very many new titles concern witchcraft. Most of these books are phony, not written by witches, mere exploitation books—but their very existence shows the change. Continue to show interest and a witch just might halfway reveal himself by saying, "Don't bother with that one. Try this one." Treat him with warm politeness and you may learn much more.

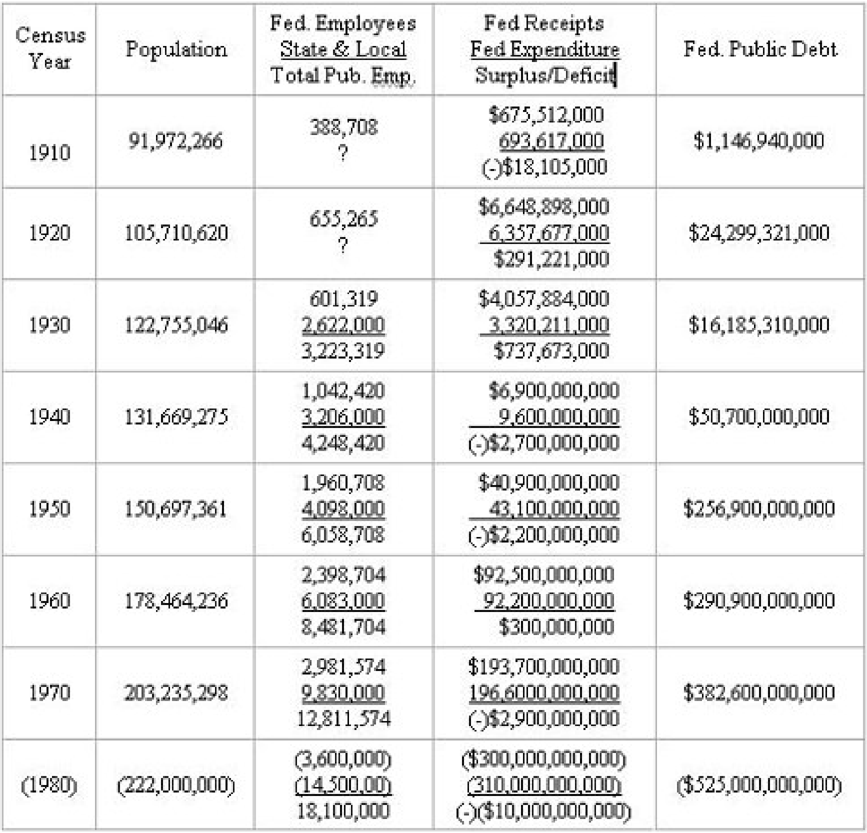
To my great surprise when I learned of it, there are over a dozen (how much over a dozen I have no way to guess) periodicals in this country devoted solely to the Old Religion.

Time Span—The Cancerous Explosion of Government

Will Rogers told us that we were lucky in that we didn't get as much government as we pay for. He was (and is) emphatically right . . . but he died 15 August 1935. The Federal government spent $6,400,000,000 in the last 12 months of his tragically short life. The year he was born (1879) the Federal government spent $274,000,000—an expensive year, as we resumed paying specie for the Greenback Inflation, $346,700,000 of fiat money.

What would Will Rogers think of a budget of $300 billion and up?

(Figures quoted from THE STATISTICAL HISTORY OF THE UNITED STATES,
Prepared by the U.S. Bureau of the Census)



Census Year	Population	Fed. Employees State & Local Total Pub. Emp.	Fed Receipts Fed Expenditure Surplus/Deficit	Fed. Public Debt
1910	91,972,266	388,708 ?	$675,512,000 693,617,000 (-)$18,105,000	$1,146,940,000
1920	105,710,620	655,265 ?	$6,648,898,000 6,357,677,000 $291,221,000	$24,299,321,000
1930	122,755,046	601,319 2,622,000 3,223,319	$4,057,884,000 3,320,211,000 $737,673,000	$16,185,310,000
1940	131,669,275	1,042,420 3,206,000 4,248,420	$6,900,000,000 9,600,000,000 (-)$2,700,000,000	$50,700,000,000
1950	150,697,361	1,960,708 4,098,000 6,058,708	$40,900,000,000 43,100,000,000 (-)$2,200,000,000	$256,900,000,000
1960	178,464,236	2,398,704 6,083,000 8,481,704	$92,500,000,000 92,200,000,000 $300,000,000	$290,900,000,000
1970	203,235,298	2,981,574 9,830,000 12,811,574	$193,700,000,000 196,6000,000,000 (-)$2,900,000,000	$382,600,000,000
(1980)	(222,000,000)	(3,600,000) (14,500,00) 18,100,000	($300,000,000,000) (310,000,000,000) (-)($10,000,000,000)	($525,000,000,000)

(1980 figures are extrapolations = wild guesses) (Too timid?) *Much* too timid!—as you knew when you read them, as I knew when I prepared them. I plotted all of the above figures on graph paper, faired the curves, *suppressed what I knew by memory* (even refrained from consulting World Almanacs to bridge the 9 years since the close of compilation of *The Statistical History*) and extrapolated to 1980 by the curves—*not* tangent, but on the indicated curve.

By the best figures I can get from Washington today (20 Nov 1979) the budget is $547,600,000,000; the expected deficit is $29,800,000,000; and our current Federal Public Debt is estimated at $886,480,000,000.(!!!)

The end of the Federal fiscal year, September 30, is still over ten months away. In ten months a lot of things can happen. Unexpected events always cause unexpected expense . . . but with great good luck the deficit will not increase much and the National Public Debt will stay under $900,000,000,000.

In case of war, all bets are off.

What is happening is what always happens in fiat-currency inflation: After a certain point, unpredictable as to date because of uncountable human variables, it becomes uncontrollable and the currency becomes worthless. Dictatorship usually follows. From there on anything can happen—all bad.

The Greenback Inflation did *not* result in collapse of the dollar and of constitutional government because gold backing was not disavowed, simply postponed for a relatively short time. The Greenback Party wanted to go on printing paper money, never resume specie payment—but eventually we toughed it out and paid hard money for the Greenbacks that had financed the Union side of the war. From 1862 to 1879 gold and silver were not used internally. Our unfavorable balance of trade for 1861–65, which *had* to be met in gold, was $296,000,000. Hard times and high taxes—but we made it.

The French Revolution inflation was unsecured. Between April 1790 and February 1796, 40 billion livres or francs were issued. New paper money (Mandats) replaced them that year; the following year both sorts were declared no longer legal tender (waste paper!)—and 2 years later Napoleon took over "to save the Republic."(!)

We could still keep from going utterly bankrupt by going back on some hard standard (gold, silver, uranium, mercury, bushels of wheat —*something)*. But it would not be easy, it would not be popular; it would mean hard times for everyone while we recovered from an almighty hangover. Do you think a Congress and a President can be elected on any such platform?

One chink in the armor of any democracy is that, when the Plebs discover that they can vote themselves Bread & Circuses, they usually do . . . right up to the day there is neither bread nor circuses. At that point they often start lynching the senators, congressmen, bankers, tax collectors, Jews, grocers, foreigners, any minority—take your choice. For they know that *they* didn't do it. The citizen is sovereign until it comes to accepting blame for his sovereign acts—then he demands a scapegoat.

I used official figures without comment to show where we have been the past 70 years . . . and how we got into the mess we are in. But, while I think our government is more nearly honest than some others (see "Inside Intourist" Afterword, page 395), there is a lot of hankypanky in those official figures. Example: Social Security taxes go into the general fund and are spent. If Social Security were *in fact* insurance (the basis on which the gimmick was sold to us by FDR's "New Deal"), the receipts would be segregated and invested and not shown as income . . . *OR* a competent insurance actuary with staff would calculate the commitment and it would show in the National Public Debt.

(The fact that a debt is amortized over the years doesn't stop it from being a debt. It was an amortized mortgage that got me into this racket. The prospect of years and years of future monthly payments spoiled my sleep.)

The only way the Government can go on paying Social "Security" to my generation is by taxing you young people more and more heavily . . . and each year there are more and more old people and fewer and fewer young people. It won't help to run the printing presses faster; that causes food to rise in price, rents to go up, etc.—and people over 65 start putting pressure on Congress . . . and there's an election coming up. (There's *always* an election coming up.)

One thing I learned as a wardheeler was that (with scarce exceptions) people in my age group want one of two things: 1) They want to keep on clipping those coupons and collecting those rents and they don't give a damn what it does to the country, or 2) they want that raise in Social Security (Townsend Plan) ("Ham & Eggs") (you name one) and they don't give a damn what it does to the country.

(I don't claim to be altruistic. Just this pragmatic difference: I am sharply aware that, if the United States goes down the chute, *I* go down with it.)

I use the term "*Federal* Public Debt" because what is usually termed the "Public Debt" is by no means our total public debt. There are also state, county, city, and special-district debts. It is difficult to get accurate figures on these public debts but the total appears to be larger than the Federal Public Debt. I can't make even a wild guess at the Social Security commitment . . . but our *total* public promises-to-pay have to exceed two trillion dollars. How much is a trillion? Well, it means that a baby born today owes at least $4,347.83 to the Federal Government alone before his eyes open. (No wonder he yells.) It means that the Zero Population Growth family (who was going to save us all—remember?) of father, mother, and 2.1 children owes $17,826 in addition to private debts (mortgage, automobile, college for 2.1 children).

Of course papa won't pay it off; that debt will grow larger. But it will cost him $2000 a year (and rising) just to "service" his pro-rata; any taxes for which he *gets anything at all*—even more laws—is on top of that.

A trillion seconds is 31,688 years, 9 months, 5 days, 8 hours, 6 minutes, and 42 seconds—long enough for the precession of the equinoxes to make Vega the Pole Star, swing back again to Polaris, and go on past to Alpha Cephei. Or counting the other way it would take us to 29,708 B.C. . . . or more than 25 thousand years before Creation by Bishop Usher's chronology for creationism.

I don't understand a trillion dollars any better than I do a trillion seconds. I simply know that we had better stop spending money we don't have if we want to avoid that Man on Horseback.

But I don't think we will stop "deficit financing," the euphemism that sounds so much better than "kiting checks."

You may have noticed that 1970 figure for public employees (not my extrapolation for 1980, but the official 1970 figures straight from the United States Bureau of the Census).

That figure does not include the Armed Forces. It does not include some special categories. It is easier to learn the number of slaves imported in 1769 (6,736) than it is to find out exactly how many people are on public payrolls in this country. And it is not simply difficult but *impossible* to determine how many people receive Federal checks for which they perform no services. (Or food stamps. Are food stamps money?) But one thing is certain: the number of people eligible to vote who *do* receive money from some unit of government (aid to dependent children, Supreme Court justices, not growing wheat, removing garbage, governors of states, whoever) exceeds the number eligible to vote but receiving no pay or subsidy of any sort from any unit of government.

Have you read the Federal Register lately? Have you *ever* read the Federal Register? Under powers delegated by Congress certain *appointed* officials can publish a new regulation in the Federal Register and, if Congress does not stop it, after a prescribed waiting time, that regulation has the force of law—it *is* law, to you and to me, although a lawyer sees nuances. I have vastly oversimplified this description, but my only purpose is to point out that "administrative law" reaches into every corner of our lives, and is the major factor in the enormous and strangling invasion of the Federal Government into our private affairs.

I can't see anything in the Constitution that permits the Congress to delegate its power to pass laws . . . but the Supreme Court says it's okay and that makes my opinion worthless.

I'm stopping. There are endless other gloomy things to discuss—the oil shortage, the power shortage (not the same thing), pollution, population pressure, a projected change in climate that can and probably will turn the problems of population and food into sudden and extreme crisis, crime in the streets and bankrupt cities, our incredible plunge from the most respected nation on Earth to the most despised (but we are nonetheless expected to pick up the tab). Bill Gresham was right but he told only half of it: you not only don't get rich peddling gloom; it isn't any fun.

So now come with me—

"OVER THE RAINBOW—"

The new President had not been in office ten days before it became clear to his own party as well as to the "loyal opposition" that he was even more of a disaster than the defeated candidate had predicted. Nevertheless the country was shocked when he served even fewer days than the ninth President—killed in a crash, his private plane, himself at the controls; dying with him his three top aides: White House chief of staff, press secretary, appointments secretary.

No U.S. or Canadian news medium said a word about alcohol or incidents in the dead President's past; they treated it as a tragic accident. Papers and TV reporters elsewhere were not as reticent.

The Speaker of the new House saw the ex-Vice President first (even before the oath of office) as the Speaker's seniority in line of succession enabled him to do. He came right to the point. "I am ready to take this load off your shoulders. We both know that you were picked simply to support the ticket; no one ever expected to load you down with *this*. Here's how we'll do it: You resign at once, then we'll meet the press together—after I'm sworn in. I'll do most of the talking. I promise you, it won't be a strain on you."

"I'm sure that it won't be. You're excused."

"Huh!"

"You may leave. In fact I am telling you to leave. I thought you had come to stand beside me as I take the oath . . . but you have something entirely different in mind. You would not enjoy staying; I would not enjoy having you stay."

"You'll regret this! You're making a mistake!"

"If a mistake was made, it was made at the Convention. By you and five others, I believe; I was not present. Yes, I may regret it but this is what I undertook to do when I accepted the nomination for the Vice-Presidency. Now get out. *Pronto!*"

The new President sent for the Director of the Budget forty minutes after the swearing in. "Explain this to me."

The Director hemmed and hawed and tried to say that the budget was too technical for anyone not in public life before—

—and was answered, "I'm accepting your resignation. Send in your deputy."

It was almost a week before this call was made: "Admiral? This is the President. If I come to your home, do you feel well enough to see me?"

There was a tussle of wills that the Admiral won only through pointing out that it was never proper to subject the President of the United States to unnecessary risk of assassination . . . and that with his new car, fitted for his wheelchair, he still went to the Pentagon twice a week. "I'm old, I admit; I was born in 1900. But I'm not dead and I'm quite able to report to my Commander in Chief. And we both know that threats have been made."

The President won the next argument. On being wheeled in the

Admiral started to get out of his chair. "Do please sit down!"

The old man continued to try to rise, leaning on the arm of his nurse. The President said quickly, "That was expressed as a request but was an order. Sit down."

The Admiral promptly sat back down, caught his breath and said formally, "Ma'am, I report—with great pleasure!—to the President of the United States."

"Thank you for coming, sir. In view of our respective ages . . . and your health, I felt that it was a time to dispense with protocol. But you are right; there are indeed a flood of threats, many more than get into the news. I don't intend to be a target . . . at least until we have a new Vice President sworn in."

"*Never* be a target, Madam. You would be mourned by everyone, both parties. Uh, if I may say so, you are even more beautiful in person than you are on the screen."

"Not mourned by everyone, I'm certain, or I would not have to be cautious about assassination. As for that other, I'm not beautiful and you know it. I know what I have. I project. But it's not physical beauty. It's something that a pro—a professionally competent actress—does with her whole being. Her voice, her expression, her hands, her body. A gestalt, with regular features the least important factor. Or not present, as with me."

The President smiled, got up and went around the big desk, leaned over the Admiral, kissed his forehead. "But you are an old dear to have said it."

He cleared his throat, noisily. "Ma'am, what is your opinion in the matter against that of millions of men?"

"We've dropped that subject. Now to work! Admiral, why is it that there has been so much difficulty with nuclear power plants ashore but never any trouble with your nuclear submarines?"

The President slapped her desk, glared at the leader of the delegation. "Stop that! Han'kerchief head, you've come to the wrong church. In this office there are *no* Blacks—or Blues, Whites, Greens, or Yellows—just Americans. Besides that, you claim to be a Black representing Blacks. Hmmph! That's a phony claim if I ever—"

"I resent that, Mrs. Ni—"

"*Pipe down!* 'Madam President,' if you please. And one does *not* interrupt the President. I said your claim was phony. It is. I'm at least three shades darker than you are . . . yet I'm smooth brown, not black." She looked around. "I don't see a real sooty black in your whole delegation. Mmm, I see just one darker than I am. Mr. Green, isn't it? That is your name?"

"Yes, Madam President. From Brooklyn."

"Any white blood, Mr. Green? Perhaps I should say 'Any Caucasian ancestry?' "

"Possibly. But none that I know of, Ma'am."

"We're all in that boat . . . including all whites. A person who claims to be absolutely certain of his ancestry more than three generations back is accepting the short end of a bet. But since you are from Brooklyn, you can help me pass a word. An important word, one that I'll be emphasizing on the networks tonight but I'll need help from a lot of people to let *all* the people know that I mean it. A Black who gets elected from Brooklyn has lots of Jewish friends, people who trust him."

"That's right, Madam President."

"Listen to my talk tonight, then pass it on in your own words. This nation has split itself into at least a hundred splinter groups, pressure groups, each trying for a bigger bite of the pie. That's got to *stop*!—before it kills us. No more Black Americans. No more Japanese Americans. Israel is not our country and neither is Ireland. A group calling itself La Raza had better mean the human race—the *whole* human race—or they'll get the same treatment from me as the Ku Klux Klan. Amerindians looking for special favors will have just two choices: Either come out and *be* Americans and accept the responsibilities of citizenship . . . or go back to the reservation and shut up. Some of their ancestors got a rough deal. But so did yours and so did mine. There are no Anglos left alive who were at Wounded Knee or Little Big Horn, so it's time to shut up about it.

"But race and skin color and national ancestry isn't all that I mean. I intend to refuse to see *any* splinter group claiming to deserve special treatment not accorded other citizens and I will veto any legislation perverted to that end. Wheat farmers. Bankrupt corporations. Bankrupt cities. Labor leaders claiming to represent 'the workers' . . . when most of the people they claim to represent repudiate any such leadership. Business leaders just as phony. Anyone who wants the deck stacked in his favor because, somehow, he's 'special.'"

The President took a deep breath, went on: "Any such group gets thrown out. But two groups will get thrown out so hard they'll bounce! I'm a woman and I'm Negro. We've wiped the Jim-Crow laws off the books; I'll veto any Crow-Jim bill that reaches this office. Discrimination? Certainly there is still discrimination—but you can't kill prejudice by passing a law. We'll make it by how we behave and what we produce—not by trick laws.

"I feel even more strongly about women. We women are a majority, by so many millions that in an election it would be called a landslide. And *will* be a landslide, on *anything,* any time women really want it to be. So women don't need favors; they just need to make up their minds what they want—then take it." The President stood up again. "That's all. I'm going to devote this term to those 'unalienable rights'—for *everybody*. No splinter groups. Go tell people so. Now git . . . and don't come back! Not as a splinter group. Come back as *Americans.*"

They moved toward the door. Their erstwhile leader muttered something. The President demanded, "Mr. Chairman, what did you say?"

"I said," he answered loudly, "you aren't going to have a second term."

She laughed at him. "I thought that's what I heard. Burr head, I'm not worrying about being reelected; I worry only about how much I can do in four years."

(Editorial in the Springfield *Eagle)*

LIFE INSURANCE?

The President's surprise nomination of the House Minority Leader for the vacant vice-presidency has produced some snide theories, one of the nastiest being the idea that she fears a plot on her life by the wheeler-dealers who put the late President into office, so she is spiking their guns (literally!) by rigging things to turn the presidency over to the opposition party should anything happen to her. . . .

. . . prefer to take her at her word, that her objective is to get the country unified again, and that a woman and a man, a Republican and a Democrat, a White and a Black, could be the team to do it.

The Speaker of the House has still not commented, but his floor leader and the nominated minority leader appeared with the President when she announced her choice. The Senate President Pro Tempore said, "I see no reason why confirmation should not go through quickly. I've known Don for thirty years; I trust that I am not so narrow-minded that I can't recognize presidential caliber in a man of another party. . . ."

. . . customary to be of the same party, there is a custom just as long standing (and more important) that a President have a Vice President he (she) trusts to carry out his (her) policies.

Let's back them to the limit! Let's all be *Americans* again!

"Thanks for coming."

"Madam President, any time you send a car for me, then scoot me across the country in a hypersonic military jet, thanks should be the other way. My first experience above the speed of sound—and my first time in the Oval Office. I never expected to be in it."

She chuckled. "Nor did I. Especially on this side of this desk. Let's get to work." She held up a book. "Recognize this?"

"Eh?" He looked startled. "Yes, Ma'am, I do. I should."

"You should, yes." She opened to a marked page, read aloud: "'—I have learned this about engineers. When something *must* be done, engineers can find a way that is economically feasible.' Is that true?"

"*I* think so, Ma'am."

"You're an engineer."

"I am an *obsolete* engineer, Ma'am."

"I don't expect you to do the job yourself. You know what I did about fusion power plants."

"You sent for the one man with a perfect record. I've seen the power ship moored off Point Sur. Brilliant. Solved an engineering and a public relations problem simultaneously."

"Not quite what I mean. I consulted the Admiral, yes. But the job was done by his first deputy, the officer he has groomed to replace him. And by some other Navy people. Now we're working on ways to make the key fission-power people—safety control especially—all former Navy nuclear submariners. But we have to do it without stripping the Navy of their Blue and Gold crews. On things I know nothing about—most things, for this job! I consult someone who *does* —and that leads me to the person who can do it. Since I know very little about how to be President, I look for advice on almost everything."

"Ma'am, it seems to me—and a lot of other people—that you were born for the job."

"Hardly. Oh, politics isn't strange to me; my father held office when I was still a girl at home. But I did my first television commercial at fourteen and I was hooked. If I hadn't been 'resting' between contracts, I would not have had accepted the Governor's appointment—I was just his 'exhibit coon' but the Commission's work did interest me. Then I was still an 'exhibit coon' when he saw to it that I was on his favorite-son slate. Then, when the three leading candidates deadlocked, my late predecessor broke the deadlock in his favor by naming me as the other half of his ticket. I went along with it with a wry grin inside, figuring, first, that the ploy wouldn't work, and second, that, if he *did* get nominated, he would find some way to wiggle out—ask me to withdraw in favor of his leading rival or some such."

She shrugged. "But he didn't—or couldn't. I don't know which; he rarely talked to me. Real talk, I mean. Not just, 'Good morning,' and, 'Did you have a comfortable flight' and not wait for an answer.

"I didn't care. I relished every minute of the campaign. An actress sometimes plays a queen . . . but for four months I got to *be* one. Never dreaming that our ticket would win. I knew what a— No, *de mortuis nil nisi bonum,* and we must get back to work. What would you do about pollution of streams?"

"Eh? But that one has already been solved. By one of the Scandinavian countries, I believe. You simply require every user to place his intake immediately downstream from his discharge of effluent into the stream. In self-protection the user cleans up his discharge. It's self-enforcing. No need to test the water until someone downstream complains. Seldom. Because it has negative feedback. Ma'am, complying with a law should be more rewarding than breaking it—or you get positive feedback."

She made a note. "We could clean up the Mississippi that way. But I'm fretted about streams inside states, too. For example, the Missouri, where it is largest, is entirely inside the State of Missouri."

"Ma'am, I think you'll find that you have jurisdiction over *all* navigable streams."

"I do?"

"Ma'am, you have powers you may never have dreamed existed. A 'navigable stream' is one only three feet deep, I think. You may right now have the power to order this under law already on the books. If there is a paragraph or even a clause on placement of inlets and outlets, you almost certainly can issue an executive order right away. Today. The boss of the U.S. Engineers would know. General Somebody. A French name."

She touched a switch. "Get me the head of the U.S. Engineers. How would you dispose of nuclear power plant wastes? Rocket them onto the Moon as someone urged last week? Why wouldn't the Sun be better? We may want to go back to the Moon someday."

"Oh, my, no! Neither one, Ma'am."

"Why not? Some of those byproducts are poisonous for hundreds of years, so I've heard. No?"

"You heard correctly. But the really rough ones have short half-lives. The ones with long half-lives—hundreds, even thousands of years, or longer—are simple to handle. But don't throw away *any* of it, Ma'am. Not where you can't recover it easily."

"Why not? We're speaking of *wastes*. I assume that we have extracted anything we can use."

"Yes, Ma'am, anything *we* can use. But our great grandchildren are going to hate you. Do you know the only use the ancient Romans had for petroleum? Medicine, that's all. *I* don't know how those isotopic wastes will be used next century . . . any more than those old Romans could guess how *very* important oil would become. But I certainly wouldn't throw those so-called wastes into the Sun! Besides, rockets do fail . . . and who wants to scatter radioactives over a couple of states? And there's the matter of the fuel and steel and a dozen other expensive things for the rockets. You could easily wind up spending more money to get rid of the ashes than you ever got from selling the power."

"Then what *do* you do? They say we mustn't sink it into the ocean. Or put it on the Antarctic ice cap. Salt mines?"

"Madam President, honest so help me, this is one of those nonproblems that the antitechnology nuts delight in. Radioactive wastes aren't any harder to handle than garbage. Or hot ashes. Or anything else you don't want to pick up in your bare hands. The quantity isn't much, not at all like garbage, or coal ashes. There are at least a half dozen easy ways. One of the easiest is to mix them with sand and gravel and cement into concrete bricks, then stack them in any unused piece of desert.

"Or glass bricks. Or let the stuff dry and store it in steel barrels such as oil drums and use those old salt mines you mentioned—the bricks you could leave in the open. All by remote manipulation, of course; that's the way a radioactives engineer does everything. Waldoes. That's old stuff. No trouble."

"I thought you said you were obsolete."

He grinned sheepishly. "Ma'am, it's easy to talk. As long as I know that young fellows will have to do the tedious drudgery that goes into making anything new work. But the solutions I've offered *are* practical. No new discoveries needed."

"How about air pollution?"

"What sorts, Ma'am? The two main sources are internal combustion engines—trucks and autos—and industrial smokes. Quite different problems."

"Pick one."

"Transportation pollution is going to solve itself soon—either the hard way or the easy way. Oil, whether it's our own or from the OPEC, is too valuable to be burned in cars and trucks; it's the backbone of the chemical engineering industry—fertilizers, plastics, pesticides, lubricants, and so forth. So, quite aside from the energy problem, we need to stop burning it. We can either wait until it's forced on us catastrophically . . . or we can turn to other transportation power voluntarily, and thereby become self-sufficient in oil for peace or for war. Either way, transportation pollution is ended."

"But *what* other transportation power, Doctor?"

"Oh. Half a dozen ways, at least. Get rid of the I.C. engine completely, both Otto cycle and Diesel cycle, and go back to the external combustion engine and steam. The I.C. engine never did make sense; starting and stopping combustion every split second is a guarantee of incomplete combustion, wasted fuel, and smog. Air pollution. External combustion has no such builtin stupidity; no matter what fuel, it burns continuously and can be adjusted for complete combustion. The Stanley Steamer used kerosene. But that's petroleum again. I would use wood alcohol as a starter—it hurts me every time I pass a sawmill and see them burning chips and slash.

"But wood alcohol has its drawbacks. We may burn hydrogen someday. Or learn to store electricity in less weight and less space. Or store energy in a flywheel. But all of those, even hydrogen, are simply ways to store energy. It still leaves an energy problem."

"Hydrogen, too? But you said we would burn it. No?"

"We'll burn it for some purposes; in some ways it's the ideal fuel; its only ash is water vapor. But, Ma'am, we don't *have* hydrogen; we have *water*—and even with perfect efficiency—never achieved—the energy you get out of hydrogen by burning it cannot exceed the energy you must use in getting that hydrogen by electrolysis of water. So you must generate electricity first."

"I see. No free lunch."

"Never a free lunch. But the energy problem can be solved several ways . . . through renewable resources. We've been using nonrenewable resources—coal and oil and cutting trees faster than they grow."

"Renewable resources—windmills and water power and sun power?"

"Wind and water power are fine but limited. I mean effectively unlimited power. Such as this new wrinkle of thermoelectric power from the temperature difference of deep ocean and surface ocean. But there aren't too many really convenient places to do that. You named the one energy that is unlimited and convenient anywhere. Sun power."

"So? What desert is convenient to the Gary steel mills?"

"Not desert, Ma'am; the Sierra Club wouldn't like it."

"I plan to tell the Sierra Club that they are *not* the government of the United States. But in stronger language."

"I look forward to hearing you, Madam President. The Sierra Club loves deserts and hates people. But our deserts aren't sufficient. Sun power, yes—but *unlimited* sun power. In orbit."

South Africa Enraged

United States Surprise Return to Gold Standard at $350 per Troy Ounce of Fine Gold Has Bourses in Turmoil

"New Policy Obvious Concomitant of

Return to Balanced Budget," Says
Treasury Secretary Spokesman

"The Way to Resume is to Resume."

By Adam Smith
Finance Editor

WASHINGTON—The Treasury Secretary, after reading aloud to the Press the President's brief announcement of resumption of specie payments immediately at $350/oz., emphasized that this was not a tactical maneuver to "strengthen the dollar," not an auction of bullion such as those in the past, but a permanent policy consistent with the administration's total policy. "A return to our traditional policy, I must add. A century ago, for 15 years, war caused us to suspend specie payments—but never with any intent to accept the vice of fiat money. Since 1971, as sequelae to 3 wars, we have had a similar problem. By letting the dollar float until the world price of gold in terms of dollars settled down, we have determined what could be called the natural price. So we have resumed specie payment at a firm gold standard. God willing, we will never leave it."

This was in answer to the London *Times* correspondent's frosty inquiry as to whether or not the Secretary thought anyone would want our gold at that price. The Treasury Secretary told him that we were not "selling gold" but promising to redeem our paper money at a gold-standard price. The *Times'* question was inspired by the fact that at the close of market Friday the London fix was $423.195 per troy ounce, with the Zurich fix, the Winnipeg fix, and the Hong Kong fix (the last only hours before the Washington announcement) all within a dollar of the London fix.

PRAVDA: "—capitalistic trickery—"

Moscow has not had a free market in gold since pre-1914 but, as a gold-producing country, its response to our resumption policy has been even more acid than the shrill complaints from Johannesburg. The Zurich gold market did not open today. London opened on time but the price dropped at once, with the first purchase at $397.127, which slowed but did not stop the decline. Winnipeg opened an hour late; the reason became clear when the Prime Minister announced the tying of the Canadian dollar to the U.S. dollar at one-to-one—a *fait accompli* as the two currencies have hunted up and down, never more than 1% apart, for the past several months.

The timing of the announcement gave the world a weekend in which to think things over, the purpose being presumably to reduce oscillations. The New York Stock Market responded with an upward surge. The Dow-Jones Industrials closed at . . . .

"Mr. Chairman, are these unofficial figures I have in front of me—that each of you has in front of you—correct? Or have my informants been leading me down the garden path? The figures on the use of hard drugs, for example?"

"Madam President, I don't know quite how to answer that."

"You don't, eh? You're Chairman of the Joint Chiefs and for four years before that chief of staff of your service. If these figures are not right, how far are they off and which way?"

"Ma'am, that is a question that should be put to each of the Services, not to me."

"So? General, you are relieved of active duty. A request for retirement will be acted on favorably, later today. You are excused. General Smith, take the chair."

The President waited until the door closed behind the ex-Chairman. Then she said soberly, "Gentlemen, it gives me no pleasure to put an end to the career of a man with a long and brilliant record. But I cannot keep in a top spot in my official family a military officer who can't or won't answer questions that, in my opinion, must be answered if I am to carry out my duties as Commander in Chief. If he had answered, 'I don't know now but I'll start digging at once and won't stop until'—but he said nothing of the sort. I gave him two chances; he brushed me off." She sighed. "I suppose he dislikes taking orders from one with no military experience; I do not assume that my sex and skin color had anything to do with it. General Smith, you are in the chair by default; I can't ask you about the other Services. How about your own? Hard drugs."

"I suspect that this figure is conservative, Ma'am. I've been trying to get hard data on hard drugs since I was appointed to this job a year ago. In most cases we need evidence from medical officers to make it stick . . . and all our doctors are overworked; we don't have nearly enough of them. Worse yet, some of the doctors are pushers themselves; two were caught."

"What happened to them? Making little ones out of big ones?"

"No, Ma'am. Discharged. In civilian practice, I suppose."

"For God's sake, *why?* Has the Army forgotten how to hold a court martial? Two drug pushers, simply sent home and still licensed to practice medicine—and to prescribe drugs. General, I'm shocked."

"Ma'am, may I say something in my own defense? Then you can have my request for retirement, if you wish it."

"Please. Go ahead."

"These cases occurred before I became Chief of Staff. At the time these two were caught, I was Superintendent of the War College; drugs are not a problem there. When last I had troop duty, I *did* have a policy of treating use of hard drugs as a criminal offense, as permitted and required by regulations. But the very most I ever managed was to get some sent to the V.A. for hospital cure and rehabilitation. Under the present rules, if a man has a good lawyer—and they do, usually—he can get away from courts martial and appeal to a civilian judge. That usually ends it."

"Madam President, may I add something?"

"Certainly, Admiral."

"Have you heard of the mutiny in the *Somers* about a century and a half back?"

"I— Yes, I think I have! A novel. Voyage to the—Voyage to the First of December. Right?"

"There was a novel some years back; I think that was the book's title. I haven't read it. Then you are aware that it was a tragic scandal, with mutineers hanged at the yardarms. What I wanted to say was this: I think the figures on drugs in the Navy are about right—lower than in the Army, of course; the circumstances are different. But what is killing the Navy—aside from a shortage of career officer material—is that both mutiny and sabotage are out of hand . . . because offenses that used to rate hanging from the yard arm are now treated as 'Boys will be boys.' A great deal of it does derive from a change in the legal structure, as the General said. I would rather have five ships properly maintained, properly manned, shipshape and Bristol style, than ten ships undermanned and shot through with men who should never have been accepted in the first place. A stupid and sullen seaman is worse than no one at all."

The President said, "Judges, chapter seven."

The Admiral looked puzzled. The Marine Commandant suddenly said, "Gideon's Band!"

"Exactly. I suspect that we have been trying to meet quotas—numbers of men—rather than placing quality first. I'm sure it's not as simple as that, but that does seem to be part of it. General, does the Air Force have any different slant on this?"

"No, Ma'am, I think the Navy and the Corps both speak for me. And the Army . . . although Smitty's problems are different from ours. Our worst problem is hanging on to trained men . . . because what we teach them, flying and electronics especially, are very salable on the outside. I want to add something, though. Marijuana is not on the list of drugs. It may very well be true that grass is no worse than liquor. But neither one mixes with driving a flying machine. Or anything in an airplane. But grass is harder to cope with. A stash is easier to hide than a bottle, and it is harder to tell when a man is stoned than when he is drunk. And much harder to prove. I welcome suggestions."

"I think we all do. Although I think we've pinpointed one essential. Quality before quantity. Gentlemen, we'll let this marinate about ten days while all of us try to spot all of the basic things that are wrong . . . then meet again and exchange ideas. In writing. Call the shots as you see them, don't be afraid of hurting feelings, pay no attention to sacred cows. Admiral, you found things wrong with the military legal system; please analyse the matter, with specific recommendations. If you truly feel that we need to go back to keelhauling and hanging at the yardarm, say so."

"I do not, Ma'am. But I do think the present rules are more suited to a Scout camp than to a fighting force. Punishment should be swift and certain; mutineers should not be coddled. We need a new code."

"Work on it. I assume that you have legal aides. Mr. Secretary of Defense, I have not intended to monopolize the floor. Before we adjourn, I want you to give us your opinions on problems of discipline. I would like to hear comment on those figures I supplied, all categories. But you aren't limited to that. Feel free to bring up anything. I think that discipline in the Armed Forces is as serious a problem as I face . . . and the most difficult."

"Discipline is not one of the duties of the Secretary of Defense."

"So? What are your duties?"

"To manage my department. Discipline belongs to these gentlemen. Not to me. And certainly not to *you.* You are way out of line."

"You forgot something, sir. The President is in the direct line of command, at the top, and cannot avoid responsibility for any aspect of her command. The Secretary of Defense is *not* in the line of command; he is an executive secretary for the President. However, since you see your job as merely managerial, and not concerned with morale and discipline, I won't press you about it. I have your signed resignation in my desk, inherited from my predecessor. I'm accepting it. At once."

The ex-Secretary leaned back and laughed. "How just like a woman! Ruffle her feathers and she flies off the handle. But it's okay, Shortie; I didn't intend to stay this long. After the Chief died I was ready to quit. But Charlie asked me to stick around a little longer, keep an eye on you. I know what you did to him the day of the tragedy, standing in his way when he was entitled to the job. You never were anything but an election poster. Didn't anybody ever tell you that?"

"You may leave now. You're excused."

"Oh, I'm leaving; I've got a press conference in ten minutes. Just one thing: You said Joe probably disliked taking orders from you because you've had no military experience. Nonsense. Any top brass expects to take orders from a civilian. But no real man will take orders from a nigger, much less a nigger wench."

The Marine was out of his chair so fast that it overturned, snatched the ex-Secretary out of his chair and got a hammerlock on him—but beat the others to it only by being closest.

"Down on your knees and apologize, you jerk! That's the *President of the United States* you're talking to!" The Marine General's Deep South accent, ordinarily carefully corrected, came out in full force, thick as gumbo.

"Make him take his hands off me!"

"Keep him secure, General. And thank you, sir. But don't rough him up more than necessary. Admiral, if you will be so kind as to check, I think you will find two Marines and two Secret Service men just outside that door. Please ask one of them to telephone for two White House Police. I want this person removed from the building and not allowed back in. Nor back into the Pentagon, ever. Most especially not into his former office."

"A pleasure, Ma'am!"

"Thank you, sir. I hope to see you all here at the same time a week from Thursday. General Smith, I ask you to remain chairman pro tem, in addition to your regular duties. Adjourn when it suits you. I'm withdrawing now; I want to lie down. I find that I am a bit shaky. . . ."

CND 406CRH

CHEYENNE—LEGISLATURE BOTH HOUSES PASSED OVERWHELMINGLY FIRST AND SECOND READING EMERGENCY MEASURE RESTORING PAUPERS OATH FOR RECIPIENTS OF ANY PUBLIC ASSISTANCE OF ANY SORT REPEAT ANY SORT IN RESPONSE TO GOVERNOR'S IMPASSIONED CLAIM THAT THERE WOULD BE NO MONEY FOR THE BLIND AND THE TOTALLY HELPLESS UNLESS STATE RETURNED TO NINETEENTH CENTURY TEST OF ELIGIBILITY MORE MORE

CND 409CRH

CHEYENNE—AMERICAN CIVIL LIBERTIES UNION WILL FILE CLASS ACTION IN FEDERAL COURT TO STOP RESTORATION OF PAUPERS OATH AS PREREQUISITE FOR PUBLIC ASSISTANCE.

"Come in, Senator! Thank you for doing me this favor!"

"Madam President, it would be a pleasure to call on you at any time even if you were not President. Perhaps more."

"Uncle Sam, I don't know what that means but I like it. Now to work! Would it suit you to work for me?"

"You know it would, my dear—but I have a constituency."

"I don't mean resign and take a job here. But can't you pair votes, or something? I need a lot of help from you right now and more later."

"Anything the President wants, the President gets. Yes, I can always arrange a pair . . . even when I'm only nominally out of the District." He looked down at her. "Trouble?"

"Work I don't know how to handle. I've got to appoint twentythree judges and I can't put it off much longer. And I don't know how to tell a knucklehead from an Oliver Wendell Holmes. See that tall stack? And that one? Those are the written opinions—or other legal writings if they are not already judges—from the candidates for judgeships. No names on them, and other identifications blacked out. Just identification numbers. I thought I could read this mess and tell which ones had their heads screwed on tight. I can't. I don't understand legalese, I'm not a lawyer."

"I'm not a lawyer either, bright eyes."

"No, but you're the world's leading semanticist. I figured that, if you couldn't understand something, then it was really nonsense."

"It's a good approach. If a person of normal intelligence, and a reasonably full education, cannot understand a piece of prose, then it *is* gibberish. But you shouldn't be doing it; you have a country to worry about. I don't have time, either, but I'll take time; my staff are quite competent to wipe the noses and hold the hands of my constituents for a while. I'll arrange it."

"Then you'll do it! Uncle Sam, you're a dear!"

"But I want a bribe."

"You do? I thought *I* was supposed to be offered bribes, not have to pay them."

"I'm eccentric. I take bribes only from pretty little girls I've known a long time."

"You're eccentric, all right. What is that thing you wear on your head? A cow pat?"

"My dear, you're colorblind. Madam President, I have a proposed amendment to the Constitution I want you to sponsor . . . and by great good luck I just happen to have a copy of it on me."

"I'll bet you sleep with a copy of it on you. No, just put it on the desk. Now tell me what it is supposed to accomplish."

"It permits a citizen to challenge the Constitutionality of any law or regulation, Federal or any lesser authority, on the grounds that it is ambivalent, equivocal, or cannot be understood by a person of average intelligence. Paragraph two defines 'average intelligence.' Paragraph three defines and limits the tests that may be used to test the challenged law. The fourth paragraph excludes law students, law school graduates, lawyers, judges, and uncertified j.p.'s from being test subjects. I call it 'the Semantic Amendment.'"

"No, you don't; you call it 'the Plain English Amendment.' Show biz, Uncle Sam. Senator, under this amendment could a person challenge the income tax law on the grounds that he has to hire an expert to make out his form 1040?"

"He certainly could. And he would win, too, as no three I.R.S. men can get the same answers out of identical data if the picture is at all complex."

"Hmm— What if he's bright enough but can't read?"

"Paragraph three."

"How about the Federal Budget? It isn't law in the usual meaning but Congress votes on it and it has the force of law, where it applies."

"First paragraph. It quacks like a duck, waddles like a duck—it's a duck."

"I'll try to study this before I fall asleep tonight. Senator, this one we're going to put over!"

"Don't be too certain, Madam President. Lawyers are going to hate this . . . and the Congress and all the state legislatures have a majority of lawyers."

"And every one of them not anxious to lose his job. That's their weakness . . . because it's awfully easy to work up hate against lawyers. Senator, this bill will be introduced by lawyers. Both Houses. Both parties. Not by you, you're not a lawyer. Uncle Sam, I'm an amateur president but I'm a pro in show biz. It'll play in Paducah."

The two Presidents were seated alone at the front of the crowded grandstand. Two kilometers in front of them a spaceship, small compared with the Shuttle assemblage, but close to the size of the Shuttle alone, stood upright in the bright Mexican mountain sunshine. A voice from everywhere was counting:

"—sixty-one seconds. . . . .one minute. . . . fifty-nine . . . fifty-eight —"

She said, "How are you coming with Spanglish, Señor el Presidente?"

He shrugged and smiled, "As before, Dona la Presidenta. I know it is simple; I hear your people and ours talking in it . . . and I understand them. But I don't have time to study. When I leave office —" He spread his hands.

"I know. Perhaps two years from now—I can't believe I've been in office only six years. It feels like sixty."

"You've accomplished sixty years of statecraft; the whole world is awestruck."

"—forty-one . . . forty . . . thirty-nine—"

"There never was anything really seriously wrong with my country, Mr. President. We made some silly mistakes, then compounded them by being stubborn. The Fence, for example. What's the point in a Fence that doesn't work? So I had it torn down."

"Madam, your most creative act of statesmanship! Without that act of faith, you and I could never have put over our Treaty of Mutual Assistance. And the dozen major advances we have started under it. This. You and I would not be sitting here."

"Yes. No more wetbacks and *this.* Mr. President, I *still* don't understand how a beam of light can put a spaceship into orbit."

"Neither do I, Madam President, neither do I. But I believe your engineers."

"So do I but it frightens me."

"—fifteen . . . The Binational Solar Power Zone is now on standby power . . . nine . . . eight—"

"*Oh!* Will you hold my hand? *Please!*"

"—four! . . . three! . . . two! . . . one! . . . *LIGHT!*"

A single inhalation by thousands, then came the everywhere voice in soft, reverent tones: "Look at that bastard *go!*"

"—direct from O'Neill Village, EllFive. It's a beautiful day here, it's *always* a beautiful day here. But today is our happiest fiesta ever; little Ariel Henson Jones, first baby born in space, is one year old today. All four of her grandparents are here, her father's parents having traveled all the way from Over-the-Rainbow, Ell-Four, via Luna City Complex, just to be here on this great day. Don't repeat this but a little bird, a parrot, told me that one of Ariel's grandmothers is pregnant again. I won't say which one but it's *personal* good news for *all* of us here in the sky because, if true and I can assure you it is, it is one more and very important datum in the rapidly growing list to show that youthfulness in all ways is markedly extended simply by living in free-fall. Correction: the mild acceleration we experience at the skin of our Village . . . but which we can leave behind completely at any time for free-fall sports at the axis.

"*And you* can enjoy them, too. This newscast comes to you sponsored by O'Neill Village Chamber of Commerce. Visitors welcome. You haven't *lived* until you ride the Light Beam, the cheapest way to travel per thousand kilometers ever invented by a factor of at least one hundred . . . and not uncomfortable even the first few seconds since the installation of the new total-support hydraulic couches. Also you haven't lived until you've seen our free-fall ballet! You think Las Vegas has shows? Wait till you see a Coriolis torch dance. Or what free-fall does for a hundred-centimeter bust. Oh, boy! Or if you like to gamble we'll take your money with brand-new games as happily as Monte Carlo or Atlantic City. See your travel agent for a variety of package vacations.

"Or more than a vacation. Buying a share in the Village is cheaper than buying a house in most cities down heavyside. But if you are young and healthy and possess certain needed skills your migration into the sky can be subsidized. Phone the placement office here for details, same rates as from San Francisco to New York. Wups! Almost forgot to tell you: knowledge of industrial Spanglish required, plus some Brownie points for any other language you know. . . ."

It *could* be that way, over the Rainbow. As Madam President said, there never has been anything incurably wrong with our country and our world—just a horrid accumulation of silly mistakes that could be corrected with horse sense and the will to do it.

We have a lot of healthy, intelligent people with a wide spread of useful skills, trades, and professions. We have a wonderful big country not yet too crowded and still wealthy in real wealth—oh, bankrupt on paper but that can always be corrected with real wealth, will, and work. Actually it's easier to be happy and get rich than it is to go down the chute. This country has so much going for it that it takes a lot of work combined with wrongheaded stubbornness to ruin this country. It's not easy.

In the meantime don't go away. There are still a lot of sacred cows I haven't kicked but plan to . . . someday. So, unless I'm hit by a taxicab while swiveling on my cane to ogle pretty girls, I'll be back.

THE END

PIE FROM THE SKY

Since we have every reason to expect a sudden rain of death from the sky sometime in the next few years, as a result of a happy combination of the science of atomics and the art of rocketry, it behooves the Pollyanna Philosopher to add up the advantages to be derived from the blasting of your apartment, row house, or suburban cottage.

It ain't all bad, chum. While you are squatting in front of your cave, trying to roast a rabbit with one hand while scratching your lice-infested hide with the other, there will be many cheerful things to think about, the assets of destruction, rather than torturing your mind with thoughts of the good old, easy days of taxis and tabloids and Charlie's Bar & Grill.

There are so many, many things in this so-termed civilization of ours which would be mightily improved by a once over lightly of the Hiroshima treatment. There is that dame upstairs, for instance, the one with the square bowling ball. Never again would she take it out for practice right over your bed at three in the morning. Isn't that some consolation?

No more soap operas. No more six minutes of good old Mom facing things bravely, interspersed with eight minutes of insistent, syrupy plugging for commercial junk you don't want and would be better off without. Never again will you have to wait breathlessly for "same time, same station" to find out what beautiful Mamie Jukes, that priceless moron, does about her nameless babe. She will be gone, along with the literary prostitute who brought her into being.

No more alarm clocks. *No more alarm clocks!* No more of the frenzied keeping of schedules, appointments, and deadlines that they imply. You won't have to gulp your coffee to run for the 8:19 commuters' special, nor keep your eye on the clock while you lunch. A few of the handy little plutonium pills dropped from the sky will end the senseless process of running for the bus to go to work to make the money to buy the food to get the strength to run for the bus. You will swap the pressure of minutes for the slow tide of eternity.

But best of all, you will be freed of the plague of the alarm that yanks you from the precious nirvana of sleep and sets you on your weary feet, with every nerve screaming protest. If you are snapped suddenly out of sleep in the Atomic Stone Age, it will be a mountain lion, a wolf, a man, or some other carnivore, not a mechanical monstrosity.

Westbrook Pegler will no longer exhibit to you his latest hate, nor will Lolly Parsons stuff you with her current girlish enthusiasm. (If your pet dislikes among the columnists are not these two, fill in names to suit yourself; none of them will bother you after the fission treatment.)

In fact, all the impact of worldwide troubles will fade away. Divorces, murders, and troubles in China will no longer smite from headline and radio. Your only worries will be your own worries.

No more John L. Lewis.

No more jurisdictional strikes.

No more "Hate-Roosevelt" clubs.

No more "Let's-Hate-Eleanor,-Too" clubs.

No more Petrillo.

No more damn fools who honk right behind your car while the lights are changing. I'll buy this one at a black market price right now.

No more Gerald L. K. Smith. . . . and, conversely, no more people who think that the persecution of their particular minority is the only evil in the entire world worth talking about, or working to correct.

No more phony "days." You won't have to buy a red carnation to show that Mom is alive nor a white one to show that she's not. (It's even money that you will have lost track of her in the debacle and not know whether she is alive or dead.) No more "Boy's Day" in our city governments with pre-adolescent little stinkers handing out fines and puritanical speeches to tired street walkers while the elected judge smiles blandly for the photographers. No more "Eat More Citrus Fruit" or "Eat More Chocolate Candy" or "Read More Comic Books" weeks thought up by the advertising agents of industries.

While we are on the subject of phony buildups, let's give a cheer for the elimination of debutantes with press agents, for the blotting out of "cafe" society, for the consignment to oblivion of the whole notion of the "coming-out" party. The resumption of the coming-out party in the United States, with its attendant, incredibly callous, waste, at the very time that Europe starves, is a scandal to the jay birds. A few atom bombs would be no more than healthy fumigation of this imbecilic evil.

No more toothsome mammals built up by synthetic publicity into movie "stars" before they have played a part in a picture. This is probably a relatively harmless piece of idiocy in our whipped-cream culture, but the end of it, via A-bombs, may stop Sarah Bernhardt from spinning in her grave.

No more overfed, under-worked, rapacious female tyrants. I won't say "mothers-in-law"; your motherin-law may be a pretty good Joe. If not, you may have a chance to cut her up for steak.

There is actually nothing to prevent American women from being able, adult, useful citizens, and many of them are. But our society is so rigged that a worthless female can make a racket of it—but not after a brisk one-two with uranium! The parasites will starve when that day comes, from the cheerful idiots of the Helen Hokinson cartoons to the female dinosaurs who use sacrosanct sex as a club to bullyrag, blackmail, and dominate every man they can reach.

The parasite males will die out, too. Yes, pal, if you can manage to zig while the atomic rockets zag you will find society much changed and in many respects improved.

There are a lot of other minor advantages you should get firmly in mind now, lest you fall prey to a fatal nostalgia after this great, fantastic, incredible, somewhat glorious and very fragile technological culture crashes about your ears. Subway smell, for example. The guy who coughs on the back of your neck in the theater. Men who bawl out waitresses. The woman who crowds in ahead of you at the counter. The person who asks how much you paid for it. The preacher with the unctuous voice and the cash register heart. The millionairess who wills her money to found a home for orphan guppies. The lunkhead who dials a wrong number (your number) in the middle of the night and then is sore at you for not being the party he wanted. The sportsman who turns his radio up loud so that he can boo the Dodgers while out in his garden. The Dodgers. People who don't curb their dogs. People who spit on sidewalks. People who censor plays and suppress books. Breach-of-promise suits. People who stare at wounded veterans.

A blinding flash, a pillar of radioactive dust, and all this will be gone.

I don't mean to suggest that it will all be fun. Keeping alive after our cities have been smashed and our government disintegrated will be a grim business at best, as the survivors in central Europe could tell you. In spite of the endless list that could be made of the things we are better off without I do not think it will be very much fun to scrabble around in the woods for a bite to eat. For that reason I am thinking of liquidating, in advance, the next character who says to me, "Well, what difference does it make if we are atom-bombed—you gotta die sometime!"

I shall shoot him dead, blow through the barrel, and say, "You asked for it, chum."

Conceding that we will all die some day, is that a reason why I should let this grinning ape drag me along toward disaster just because he will take no thought of tomorrow?

Since there are so many of him the chances of us, as a nation, being able to avert disaster are not good. Perhaps some of us could form an association to live through World War III. Call it the *League for the Preservation of the Human Race,* or the *Doom's Day Men,* or something like that. Restrict the membership to survivor types, sound in tooth and wind, trained in useful trades or science, reasonably high I.Q.'s and proved fertility. Then set up two or three colonies remote from cities and other military targets.

It might work.

Maybe I will start it myself if I can find an angel to put up the dough for the original promotion. That should get me in as an *ex-officio* member, I hope. I have looked over my own qualifications and I don't seem to measure up to the standards.

My ancestors got into America by a similar dodge. They got here early, when the immigration restrictions were pretty lax. Maybe I can repeat.

I am sure I shall not resign myself to death simply because Joe Chucklehead points out that atomization is quick and easy. Even if that were good I would not like it. Furthermore, it is not true. Death comes fast at the center of the blast; around the edges is a big area of the fatal burn and the slow death, with plenty of time to reconsider the disadvantages of chuckleheadness in the Atomic Age, before your flesh sloughs off and you give up the ghost. No, thank you, I plan to disperse myself to the country.

Of course, if you are so soft that you *like* innerspring mattresses and clean water and regular meals, despite the numerous advantages of blowing us off the map, but are not too soft to try to do something to avoid the coming debacle, there is something you can do about it, other than forming Survival Leagues or cultivating an attitude of philosophical resignation.

If you really want to hang on to the advantages of our slightly wacky pseudo-civilization, there is just one way to do it, according to the scientists who know the most about the new techniques of war—and that is to form a sovereign world authority to prevent the Atomic War.

Run, do not walk, to the nearest Western Union, and telegraph your congressman to get off the dime and get on with the difficult business of forming an honest-to-goodness world union, with no jokers about Big Five vetoes or national armaments . . . to get on with it promptly, while there is still time, before Washington, D.C., is reduced to radioactive dust—and he with it, poor devil!

THE LAST DAYS OF THE UNITED STATES

"Here lie the bare bones of the United States of America, conceived in freedom, died in bondage. 1776–1986. Death came mercifully, in one stroke, during senility.

"Rest in Peace!"

No expostulations, please. Let us not kid ourselves. The next war can destroy us, utterly, as a nation—and World War III is staring us right in the face. So far, we have done little to avert it and less to prepare for it. Once upon a time the United Nations Organization stood a fair chance of preventing World War III. Now, only a major operation can equip the UNO to cope with the horrid facts of atomics and rocketry—a major operation which would take away the veto power of the Big Five and invest the world organization with the sole and sovereign power to possess atomic weapons.

Are we, as a people, prepared to make the necessary sacrifices to achieve a world authority?

Take a look around you. Many of your friends and neighbors believe that the mere possession of the atomic bomb has rendered us immune to attack. So—the country settles back with a sigh of relief, content to leave foreign affairs to William Randolph Hearst, the Denver Post, and the Chicago Tribune. We turn our backs on world responsibility and are now hell-bent on new washing machines and new cars.

From such an attitude, with dreadful certainty, comes World War III, the Twenty Minute War, the Atomic War, the War of Final Destruction. The "secret" of the atomic bomb cannot be kept, the experts have told us repeatedly, for the "secret" is simply engineering know-how which can be developed by any industrial nation.

From this fact it can be predicted that any industrial nation, even though small and comparatively weak, will in a few years be able to create the means to destroy the United States at will in one all-out surprise attack. What constitutes a strong power in the Atomic Era? Scientific knowledge, engineering skill, and access to the ores of uranium—no more is needed. Under such circumstances the pretensions of the Big Five to veto powers over the affairs of this planet are preposterous. At the moment there is only the Big One, the United States, through its temporary exclusive possession of the Bomb. Tomorrow—five to ten years—the list might include any of the many nations with the two requirements.

Belgium and Canada have the greatest known deposits of uranium. Both are small but both possess science and skill in abundance. Potentially they are more powerful than any of the so-called Big Five, more powerful than the United States or Russia. Will they stand outside indefinitely, hat in hand, while the "Big Five" determine the fate of the human race? The developments of atomic weapons and of rocketry are analogous to the development of the revolver in individual affairs—it has made the little ones and the big ones all the same size. Some fine day some little nation may decide she is tired of having us around, give us one twenty-minute treatment with atomic rocket bombs, and accept our capitulation.

We have reason to fear such an attack. We have been through one Pearl Harbor; we *know* that it can happen to us. Our present conduct breeds fear and distrust in the hearts of men all over the globe. No matter how we think of ourselves, no matter how peaceful and good hearted we think ourselves to be, two facts insure that we will be hated by many. We have the Bomb—it is like a loaded revolver pointed at the heads of all men. Oh, we won't pull the trigger! Nevertheless, do you suppose they love us for it?

Our other unforgivable sin is being rich while they are poor. Never mind our rationalizations—they see our wasteful luxury while much of the globe starves. Hungry men do not reason calmly. We are getting ourselves caught in a situation which should lead us to expect attack from any quarter, from whoever first produces atomic weapons and long-distance rockets.

Knowing these things, the professional gentlemen who are charged with the defense of this country, the generals and the admirals and the members of the military and naval affairs committees of both houses, are cudgelling their brains in a frenzied but honest attempt to persuade the rest of the country to follow this course or that, which, in their several opinions, will safeguard the country in any coming debacle.

But there is a tragic sameness to their proposals. With few exceptions, they favor preparedness for the *last* war. Thusly:

Conscription in peacetime to build up a reserve;
Emphasis on aircraft carriers rather than battleships;
Decentralization of cities;
An armaments race to keep our head start in atomic weapons;
Agreements to "outlaw" atomic weapons;
Consolidation of the Army and the Navy;
Buying enough war planes each year to insure new development;
An active military and foreign affairs intelligence corps;
Moving the aircraft industry inland;
Placing essential war industry underground.

These are the *progressive* proposals. (Some still favor infantry and battleships!) In contrast, General Arnold says to expect war in which *space ships* cruise outside the atmosphere and launch superhigh-speed, atomic-armed rockets on cities below. Hap Arnold tells his boys to keep their eyes on Buck Rogers. Somebody is wrong—is it Hap Arnold or his more conservative colleagues?

Compulsory military training—France had that, for both wars. The end was Vichy.

Aircraft carriers vs. battleships. Look, pals, the aircraft carrier was the weapon of *this* war, before Hiroshima. Carriers don't look so good against space ships. Let's build galleons instead; they are cheaper, prettier, and just as useful.

Decentralization of large cities—let's table this one for a moment. There is some sense to it, if carried to its logical conclusion. But not with half measures and not for $250,000,000,000, the sum mentioned by Sumner Spaulding, its prime proponent.

Bigger and better atomic weapons for the United States—this has a reasonable and reassuring sound. We've got the plant and the trained men; let's stay ahead in the race. Dr. Robert Wilson says that atomic bombs a hundred or a thousand times as powerful as the Hiroshima bomb are now in prospect. Teddy Roosevelt advised us to "Speak softly but carry a big stick."

It is a tempting doctrine, but the greathearted Teddy died long before Hiroshima; his day was the day of the charge up San Juan Hill. A hundred obsolete atomic bombs could destroy the United States—if the enemy struck first. Our super bombs would not save us, unless we were willing to strike first, without declaring war. If two men are locked in a basement, one armed with a 50-calibre machine gun, the other with an 18th century ball-and-powder pistol, victory goes to the man who shoots first, not to the one with the better weapon. That is the logic of atomics and now is the time to learn it by heart.

Agreements to "outlaw" atomic weapons? Swell! Remember the Kellogg Pact? It "outlawed" war.

Consolidation of the armed forces: A proposition sensible in itself, but disastrously futile unless we realize that *all* previous military art is obsolete in the atomic age. The best pre-Hiroshima weapons are now no more than the sidearms of the occupying military police. Buck Rogers must be the new chief of staff. Otherwise we will find ourselves with the most expensive luxury in the world—a second-best military establishment.

Purchase of military aircraft in quantities to insure new development—we bought sailing ships-of-the-line in the 1880's. This makes the same sort of pseudo-sense. Airplanes are already obsolete—slow, clumsy, and useless. The V-2 is credited with a speed of 3600 miles per hour. Here is a simple problem in proportion: The Wright Brothers crate at Kitty Hawk bears the same relation to the B-29 that the V-2 bears to the rocket ship of the coming war. Complete the equation by visualizing the coming rocket ship. Then stop wasting taxes on airplanes.

An efficient intelligence system—Fine! But no answer in itself. The British intelligence was quite efficient before this war. Mr. Chamberlain's desk was piled high with intelligence reports, reports which showed that Munich need never have happened. This has since been confirmed by high German General Staff officers. But Mr. Chamberlain did not read the reports. *Intelligence reports are useful only to the intelligent.*

Moving the aircraft industry inland—excellent preparation for World War II. Move an industry which we don't need for World War III inland where it will be safe from the weapons of World War II. While we are about it let's put stockades around them to keep the Indians out. In the meantime our potential enemies will have plenty of time to perfect long-range rockets.

Placing key war industry underground—assembly lines underground are all very well, but blast furnaces and many other things simply won't fit. Whatever digging in we do, be sure we do it so secretly that the enemy will never suspect, lest he drop an earthquake-type atomic bomb somewhere nearby and bury all hands. Let us be certain, too, that he does not introduce a small atomic bomb inside the underground works, disguised as a candy vending machine, a lunch pail, or a fire extinguisher. The age of atomics is a field day for saboteurs; underground works could be colossal death traps.

No one wants this new war, no sane men anywhere. Yet we are preparing for it and a majority, by recent Gallup polls, believe it will come. We have seen the diplomats and prime ministers and presidents and foreign affairs committees and state departments manage to get things messed up in the past; from where we sit it looks as if they were hell-bent on messing them up again. We hear the rumble of the not-so-distant drum.

What we want, we little men everywhere, is planetary organization so strong that it can enforce peace, forbid national armaments, atomic or otherwise, and in general police the globe so that a decent man can raise his kids and his dog and smoke his pipe free from worry of sudden death. But we see the same old messing around with half measures.

(If you want to help to try to stop the messing-up process, you might write Congressman Jerry Voorhis, or Senator Fulbright, or Senator Ball, or Beardsley Ruml, or Harold Stassen. Or even the President himself.)

If things go from bad to worse and we have to fight a war, can we prepare to win it? First let us try to grasp what kind of a war it will be. Look at LIFE, Nov. 19, 1945, page 27: *THE 36-HOUR WAR: Arnold Report Hints at the Catastrophe of the Next Great Conflict.* The first picture shows Washington, D.C., being destroyed by an atomic rocket bomb. The text and pictures go on to show 13 U.S. cities being destroyed the same way, enemy airborne troops attempting to occupy, the U.S. striking back with its own rockets from underground emplacements, and eventually winning—at a cost of 13 cities and at least 10,000,000 American lives.

Horrible as the picture is, it is much too optimistic. There is no reason at all to assume that the enemy will attack in too little force, destroying only 13 cities, or to assume that he will attempt to occupy until we have surrendered, or to assume that we will be able to strike back after we are attacked.

It is not safe to assume that the enemy will be either fainthearted or foolish. If he follows our example with Japan, he will smash us until we surrender, then land. If his saboteurs are worth their blood money, our own rocket emplacements may be blown up by concealed atomic bombs just in advance of the attack.

Atomic rocket warfare has still another drawback—it is curiously anonymous. We might think we knew who had attacked us but be entirely mistaken.

You can think of at least three nations which dislike both us and Russia. What better joke for them than to select a time when suspicion has been whipped up between the two giants to lob just a few atomic rockets from a ship in the North Atlantic, or from a secret emplacement in the frozen north of Greenland—half at us, half at Russia, and with the attack in each case apparently coming from the other, and then sit back while we destroyed each other!

A fine joke! You would die laughing.

Don't think it can't be done, to us and to Russia.

What *can* we do?

The first thing is to get Congress to take a realistic view of the situation. The most certain thing about LIFE's description of the coming war was the destruction of Washington. Washington is the prime military target on earth today for it is the center of the nervous system of the nation that now has the Bomb. It must be destroyed first and it will be destroyed, if war ever comes. Your congressman has the most dangerous job in the world today. You may live through World War III—*he* can't. Make yours realize this; he may straighten up and fly right.

What we want him to work for is world order and world peace. But we may not get it. The other nations may be fed up with our shilly-shallying and may not go along with us, particularly any who believe they are close to solving the problems of atomic weapons. We may have to go it alone. In such cases, is there anything we can do to preserve ourselves?

Yes, probably—but the price is high.

We can try for another Buck Rogers weapon with which to ward off atomic bomb rockets. It would need to be better than anything we have now or can foresee. To be 100% effective (with atom bombs, anything less is hardly good enough!) it should be something which acts with much greater speed than guns or antiaircraft rockets. There is a bare possibility that science could cook up some sort of a devastatingly powerful beam of energy, acting with the speed of light, which would be a real antiaircraft weapon, even against rockets. But the scientists don't promise it.

We would need the best antiaircraft devices possible, in the meantime. A robot hook-up of target-seeking rockets, radar, and computing machines might give considerable protection, if extensive enough, but there is a lot of research and test and production ahead before any such plan is workable. Furthermore, it could not be air tight and it would be very expensive—and very annoying, for it would end civilian aviation. If we hooked the thing up to ignore civilian planes, we would leave ourselves wide open to a Trojan Horse tactic in which the enemy would use ordinary planes to deliver his atomic bombs.

Such a defense, although much more expensive and much more trouble than all our pre-War military establishment, would be needed. If we are not willing to foot the bill, we can at least save money by not buying flame throwers, tanks, or battleships.

We can prepare to attack. We can be so bristlingly savage that other nations may fear to attack us. If we are not to have a superstate and a world police, then the United States needs the fastest and the most long-range rockets, the most powerful atomic blasts, and every other dirty trick conceived in comic strip or fantastic fiction. We must have space ships and we must have them first. We must land on the Moon and take possession of it in order to forbid its use to other nations as a base against us and in order to have it as a base against any enemy of ours. We must set up, duplicate, and reduplicate rocket installations intended to destroy almost automatically any spot on earth; we must let the world know that we have them and that we are prepared to use them at the drop of a diplomat's silk hat. We must be prepared to tell uncooperative nations that there are men sitting in front of switches, day and night, and that an attack on Washington would cause those switches to be thrown.

And we must guard the secrets of the locations and natures of our weapons in a fashion quite impossible for a normal democracy in peace time. More of that later.

Decentralization we would have to have. Not the picayune $250,000,000,000 job which has been proposed—

("Wait a minute! Why should we disperse our cities if we are going to have that Buck Rogers super-dooper death ray screen?")

We haven't *got* such a screen. Nor is it certain that we will ever have such a screen, no matter how much money we spend. Such a screen is simply the one remote possibility which modern physics admits. It may turn out to be impossible to develop it; we simply don't know.

We must disperse thoroughly, so thoroughly that no single concentration of population in the United States is an inviting target. Mr. Sumner Spaulding's timid proposal of a quarter of a trillion dollars was based on the pleasant assumption that Los Angeles was an example of a properly dispersed city for the Atomic Age. This is an incredible piece of optimism which is apparently based on the belief that Hiroshima is the pattern for all future atomic attacks. Hiroshima was destroyed with *one* bomb. Will the enemy grace the city of the Angels with only *one* bomb? Why not a dozen?

The Hiroshima bomb was the gentlest, least destructive atomic bomb ever likely to be loosed. Will the enemy favor us with a love tap such as that?

Within twenty miles of the city hall of Los Angeles lives half the population of the enormous state of California. An atomic bomb dropped on that City Hall would not only blast the swarming center of the city, it would set fire to the surrounding mountains ("WARNING! No Smoking, In or Out of Cars—$500 fine and six months imprisonment") from Mount Wilson Observatory to the sea. It would destroy the railroad terminal half a dozen blocks from the City Hall and play hob with the water system, water fetched clear from the State of Arizona.

If that is dispersion, I'll stay in Manhattan.

Los Angeles is a modern miracle, an enormous city kept alive in a desert by a complex and vulnerable concatenation of technical expedients. The first three colonies established there by the Spaniards starved to death to the last man, woman, and child. If the fragile structure of that city were disrupted by a single atomic bomb, those who survived the blast would in a few short days be reduced to a starving, thirst-crazed mob, ready for murder and cannibalism.

No, if we are to defend ourselves we must not assume that Los Angeles is "dispersed" despite the jokes about her far-flung city line. The Angelenos must be relocated from Oregon to Mexico, in the Mojave Desert, in Imperial Valley, in the great central valley, in the Coast Range, and in the High Sierras.

The same principles apply everywhere. Denver must be scattered out toward Laramie and Boulder, while Colorado Springs must flow around Pike's Peak to Cripple Creek. Kansas City and Des Moines must meet at the Iowa-Missouri line, while Joplin flows up toward Kansas City and on down into the Ozarks. As for Manhattan, that is almost too much to describe—from Boston to Baltimore all the great east coast cities must be abandoned and the population scattered like leaves.

The cities must go. Only villages must remain. If we are to rely on dispersion as a defense in the Atomic Age, then we must spread ourselves out so thin that the enemy cannot possibly destroy us with one bingo barrage, so thin that we will be too expensive and too difficult to destroy.

It would be difficult. It would be incredibly difficult and expensive—Mr. Spaulding's estimate would not cover the cost of new housing alone, but new housing would be the least of our problems. We would have to rebuild more than half of our capital plant—shops, warehouses, factories, railroads, highways, power plants, mills, garages, telephone lines, pipe lines, aqueducts, granaries, universities. We would have to take the United States apart and put it back together again according to a new plan and for a new purpose. The financial cost would be unimportant, because we could not buy it, we would have to *do* it, with our own hands, our own sweat. It would mean a sixty-hour week for everyone, no luxury trades, and a bare minimum standard of living for all for some years. Thereafter the standard of living would be permanently depressed, for the new United States would be organized for defense, not for mass production, nor efficient marketing, nor convenient distribution. We would have to pay for our village culture in terms of lowered consumption. Worse, a large chunk of our lowered productivity must go into producing and supporting the atomic engines of war necessary to strike back against an aggressor—for dispersion alone would not protect us from invasion.

If the above picture is too bleak, let us not prate about dispersion. There are only three real alternatives open to us: One, to form a truly sovereign superstate to police the globe; two, to prepare realistically for World War III in which case dispersion, real and thorough dispersion, is utterly necessary, or, third, to sit here, fat, dumb, and happy, wallowing in our luxuries, until the next Hitler annihilates us!

The other necessary consequences of defense by dispersion are even more chilling than the economic disadvantages. If we go it alone and depend on ourselves to defend ourselves we must be prepared permanently to surrender that democratic freedom of action which we habitually enjoyed in peace time. We must resign ourselves to becoming a socialistic, largely authoritarian police state, with freedom of speech, freedom of occupation, and freedom of movement subordinated to military necessity, as defined by those in charge.

Oh, yes! I dislike the prospect quite as much as you do, but I dislike still more the idea of being atomized, or of being served up as a roast by my starving neighbors. Here is what you can expect:

The front door bell rings. Mr. Joseph Public, solid citizen, goes to answer it. He recognizes a neighbor. "Hi, Jack! What takes you out so late?"

"Got some dope for you, Joe. Relocation orders—I was appointed an emergency deputy, you know."

"Hadn't heard, but glad to hear. Come in and sit down and tell me about it. How do the orders read? We stay, don't we?"

"Can't come in—thanks. I've got twentythree more stops to make tonight. I'm sorry to say you don't stay. Your caravan will rendezvous at Ninth and Chelsea, facing west, and gets underway at noon tomorrow."

"What!"

"That's how it is. Sorry."

"Why, this is a damned outrage! I put in to stay here—with my home town as second choice."

The deputy shrugged. "So did everybody else. But you weren't even on the list of essential occupations from which the permanent residents were selected. Now, look—I've got to hurry. Here are your orders. Limit yourself to 150 pounds of baggage, each, and take food for three days. You are to go in your own car—you're getting a break —and you will be assigned two more passengers by the convoy captain, two more besides your wife I mean."

Joe Public shoved his hands in his pockets and looked stubborn. "I won't be there."

"Now, Joe, don't take that attitude. I admit it's kinda rough, being in the first detachment, but you've had lots of notice. The newspapers have been full of it. It's been six months since the President's proclamation."

"I won't go. There's some mistake. I saw the councilman last week and he said he thought I would be all right. He—"

"He told everybody that, Joe. This is a *Federal* order."

"I don't give a damn if it's from the Angel Gabriel. I tell you I won't go. I'll get an injunction."

"You can't, Joe. This has been declared a military area and protests have to go to the Provost Marshal. I'd hate to tell you what he does with them. Anyhow, you can't stay here—it's no business of mine to put you out; I just have to tell you—but the salvage crews will be here tomorrow morning to pull out your plumbing."

"They won't get in."

"Maybe not. But the straggler squads will go through all of these houses first."

"I'll shoot!"

"I wouldn't advise it. They're mostly ex-Marines."

Mr. Public was quiet for a long minute. Marines. "Look, Jack," he said slowly, "suppose I do go. I've got to have an exemption on this baggage limitation and I can't carry passengers. My office files alone will fill up the back seat."

"You won't need them. You are assigned as an apprentice carpenter. The barracks you are going to are only temporary."

"*Joseph! Joseph!* Don't stand there with the door open! Who is it?" His wife followed her voice in.

He turned to tell her; the deputy took that as a good time to leave.

At eleven the next morning he pulled out of the driveway, gears clashing. He had the white, drawn look of a man who has been up all night. His wife slept beside him, her hysteria drowned in a triple dose of phenobarbital.

That is dispersion. If you don't believe it, ask any nativeborn citizen of Japanese blood. Nothing less than force and police organization will drive the peasants off the slopes of Vesuvius. The bones of Pompeii and Herculaneum testify to that. Or, ask yourself—will you go willingly and cheerfully to any spot and any occupation the government assigns to you? If not, unless you are right now working frantically to make World War III impossible, you have not yet adjusted yourself to the horrid facts of the Atomic Age.

For these *are* the facts of the Atomic Age. If we are not to have a World State, then we must accept one of two grim alternatives: A permanent state of total war, even in "peace" time, with every effort turned to offense and defense, or relax to our fate, make our peace with God, and wait for death to come out of the sky. The time in which to form a World State is passing rapidly; it may be gone by the time this is printed. It is worthwhile to note that the publisher of the string of newspapers most bitterly opposed to "foreign entanglements," particularly with Russia, and most insistent on us holding on to the vanishing "secret" of the atomic bomb—this man, this publisher, lives on an enormous, self-sufficient ranch, already dispersed. Not for him is the peremptory knock on the door and the uprooting relocation order. Yet he presumes daily to tell our Congress what must be done with us and for us.

Look at the facts! Go to your public library and read the solemn statements of the men who built the atomic bomb. Do not let yourself be seduced into a false serenity by men who do not understand that the old world is dead. Regularly, in the past, our State Department has bungled us into wars and with equal regularity our military establishment has been unprepared for them. Then the lives and the strength of the common people have bought for them a victory.

Now comes a war which cannot be won after such mistakes.

If we are to die, let us die like men, eyes open, aware of our peril and striving to cope with it—not as fat and fatuous fools, smug in the belief that the military men and the diplomats have the whole thing under control.

"It is later than you think."

LARGER THAN LIFE

A Memoir in Tribute to
Dr. Edward E. Smith

August 1940—a back road near Jackson, Michigan—a 1939 Chevrolet sedan:

"Doc" Smith is at the wheel; I am in the righthand seat and trying hard to appear cool, calm, fearless—a credit to the Patrol. Doc has the accelerator floorboarded . . . but has his head tilted over at ninety degrees so that he can rest his skull against the frame of the open left window—in order to listen by bone conduction for body squeaks.

Were you to attempt this position yourself—car parked and brakes set, by all means; I am not suggesting that you *drive*—you would find that your view of the road ahead is between negligible and zero.

I must note that Doc was *not* wearing his Lens.

This leaves (by Occam's Razor) his sense of perception, his almost superhuman reflexes, and his ability to integrate instantly all available data and act therefrom decisively and correctly.

Sounds a lot like the Gray Lensman, does it not?

It should, as no one more nearly resembled (in character and in ability—not necessarily in appearance) the Gray Lensman than did the good gray doctor who created him.

Doc could do almost anything and do it quickly and well. In this case he was selecting and road-testing for me a secondhand car. After rejecting numberless other cars, he approved this one; I bought it. Note the date: August 1940. We entered World War Two the following year and quit making automobiles. I drove that car for twelve years. When I finally did replace it, the mechanic who took care of it asked to be permitted to buy it rather than have it be turned in on a trade . . . because, after more than thirteen years and hundreds of thousands of miles, it was *still a* good car. Doc Smith had not missed *anything.*

Its name? *Skylark Five,* of course.

So far as I know, Doc Smith could not play a dulcimer (but it would not surprise me to learn that he had been expert at it). Here are some of the skills I know he possessed:

Chemist & chemical engineer—and anyone who thinks these two professions are one and the same is neither a chemist nor an engineer. (My wife is a chemist and is also an aeronautical engineer—but she is not a chemical engineer. All clear? No? See me after class.)

Metallurgist—an arcane art at the Trojan Point of Black Magic and science.

Photographer—all metallurgists are expert photographers; the converse is not necessarily true.

Lumberjack

Cereal chemist

Cook

Explosives chemist—research, test, & development—product control

Blacksmith

Machinist (tool & diemaker grade)

Carpenter

Hardrock miner—see chapter 14 of *First Lensman,* titled "Mining and Disaster." That chapter was written by a man who had *been* there. And it is a refutation of the silly notion that science fiction does not require knowledge of science. Did I hear someone say that there is no *science* in that chapter? Just a trick vocabulary—trade argot—plus description of some commonplace mechanical work—

So? The science (several sciences!) lies just below the surface of the paper . . . and permeates every word. In some fields I could be fooled, but not in this one. I've been in mining, off and on, for more than forty years.

Or see *Spacehounds of IPC,* chapters 3 & 4, pp. 40–80 . . . and especially p. 52 of the Fantasy Press hardcover edition. Page 52 is almost purely autobiographical in that it tells *why* the male lead, "Steve" Stevens, knows how to fabricate from the wreckage at hand everything necessary to rescue Nadia and himself. I once discussed with Doc these two chapters, in detail; he convinced me that his hero character could do these things by convincing me that he, Edward E. Smith, could do all of them . . . and, being myself an experienced mechanical engineer, it was not possible for him to give me a "snow job." (I think he lacked the circuitry to give a "snow job" in any case; incorruptible honesty was Dr. Smith's prime attribute—with courage to match it.)

What else could he do? He could call square dances. Surely, almost anyone can squaredance . . . but to become a caller takes longer and is much more difficult. When and how he found time for this I do not know—but, since he did everything about three times as fast as ordinary people, there is probably no mystery.

Both Doc and his beautiful Jeannie were endlessly hospitable. I stayed with them once when they had *nine* houseguests. They seemed to enjoy it.

But, above all, Doc Smith was the perfect, gallant knight, sans peur et sans reproche.

And all of the above are reflected in his stories.

It is customary today among self-styled "literary critics" to sneer at Doc's space epics—plot, characterization, dialog, motivations, values, moral attitudes, *etc.* "Hopelessly old-fashioned" is one of the milder disparagements.

As Al Smith used to say: "Let's take a look at the record."

Edward Elmer Smith was born in 1890, some forty years before the American language started to fall to pieces—long, long before the idiot notion of "restricted vocabulary" infected our schools, a half century before our language was corrupted by the fallacy that popular usage defines grammatical correctness.

In consequence Dr. Smith made full use of his huge vocabulary, preferring always the exact word over a more common but inexact word. He did not hesitate to use complex sentences. His syntactical constructions show that he understood and used with precision the conditional and the subjunctive modes as well as the indicative. He did not split infinitives. The difference between "like" and "as" was not a mystery to him. He limited barbarisms to quoted dialog used in characterization.

("Oh, but that dialog!") In each story Doc's male lead character is a very intelligent, highly educated, cheerful, emotional, enthusiastic, and genuinely modest man who talks exactly like Doc Smith, who was a very intelligent, highly educated, cheerful, emotional, enthusiastic, and genuinely modest man.

In casual conversation Doc used a number of clichés . . . and his male lead characters used the same or similar ones. This is a literary fault? I think not. In casual speech most people tend to repeat each his own idiosyncratic pattern of clichés. Doc's repertory of clichés was quite colorful, especially so when compared with patterns heard today that draw heavily on "The Seven Words That Must Never Be Used in Television." A 7-word vocabulary offers little variety.

("But those embarrassing love scenes!") E. E. Smith's adolescence was during the Mauve Decade; we may assume tentatively that his attitudes toward women were formed mainly in those years. In 1914, a few weeks before the war in Europe started, he met his Jeannie—and I can testify of my own knowledge that, 47 years later (i.e., the last time I saw him before his death) he was still dazzled by the wonderful fact that this glorious creature had consented to spend her life with him.

Do you remember the cultural attitudes toward romantic love during the years before the European War? Too early for you? Never mind, you'll find them throughout Doc Smith's novels. Now we come to the important question. The Lensman novels are laid in the far future. Can you think of any reason why the attitudes between sexes today (ca. 1979) are more likely to prevail in the far future than are attitudes prevailing before 1914?

(I stipulate that there are many other possible patterns. But we are now comparing just these two.)

I suggest that the current pattern is contrasurvival, is necessarily most temporary, and is merely one symptom of the kaleidoscopic and possibly catastrophic rapid change our culture is passing through (or dying from?).

Contrariwise, the pre-1914 values, whatever faults they may have, are firmly anchored in the concept that a male's first duty is to protect women and children. *Pro*survival!

"Ah, but those hackneyed plots!" Yes, indeed!—and for excellent reason: The ideas, the cosmic concepts, the complex and sweeping plots, all were brand new when Doc invented them. But in the past half century dozens of other writers have taken his plots, his concepts, and rung the changes on them. The ink was barely dry on *Skylark of Space* when the imitators started in. They have never stopped—pygmies, standing on the shoulders of a giant.

But all the complaints about "Skylark" Smith's alleged literary faults are as nothing to the (usually unvoiced) major grievance:

Doc Smith did not go along with *any* of the hogwash that passes for a system of social values today.

He believed in Good and Evil. He had no truck with the moral relativism of the neo- (cocktail-party) Freudians.

He refused to concede that "mediocre" is better than "superior."

He had no patience with selfpity.

He did not think that men and women are equal—he would as lief have equated oranges with apples. His stories assumed that men and women are *different,* with different functions, different responsibilities, different duties. Not equal but complementary. Neither complete without the other.

Worse yet, in his greatest and longest story, the 6-volume Lensman novel, he assumes that all humans are *un*equal (and, by implication, that the cult of the common man is pernicious nonsense), and bases his grand epic on the idea that a planned genetic breeding program thousands of years long can (and *must*) produce a new race superior to *h. sapiens* . . . supermen who will become the guardians of civilization.

The Lensman novel was left unfinished; there was to have been at least a seventh volume. As always, Doc had worked it out in great detail but never (so far as I know) wrote it down . . . because it was unpublishable—then. But he told me the ending, orally and in private.

I shan't repeat it; it is not my story. Possibly somewhere there is a manuscript—I *hope* so! All I will say is that the ending develops by inescapable logic from clues in *Children of the Lens*.

So work it out for yourself. The original Gray Lensman left us quite suddenly—urgent business a long way off, no time to spare to tell us more stories.

THE GOOD NEWS OF

HIGH FRONTIER

by

Robert A. Heinlein

“High Frontier,” is the best news I have heard since VJ Day.

For endless unhappy years the United States has had no defense policy. We had something we called a defense policy. . . but in the words of Abraham Lincoln, “Calling a tail a leg doesn’t make it a leg.”

Under our present policies what do we have? H-bombs, airborne, waterborne, and in silos, capable of destroying anything, anywhere on this planet. Elite troops second to none in our Marine Corps, in our Army’s 82nd Airborne, and in our Navy -SEALs. Other armed forces stationed around the world and on every ocean. Eyes in the sky that can spot any missile launched in our direction.

And none of these can even slow down an ICBM launched at

Washington.

(Or at your hometown).

So we have *no* defense. Instead we have something mislabeled a "defense policy," called "Mutually Assured Destruction," referred to as "MAD."

Never has Washington produced an acronym that fitted so perfectly. Picture two men at point-blank range each with a .45 aimed at the other man's bare chest. That is MAD. Crazy. Insane. And *stupid.*

High Frontier places a bulletproof vest on our bare chest. High Frontier is as non-aggressive as a bulletproof vest. There is no way to kill anyone with High Frontier—all that High Frontier can do is to keep others from killing us.

That is one of the two best aspects of High Frontier. It is so utterly peaceful that the most devout pacifist can support it with a clear conscience—indeed *must* support it once he understands it . . . as it tends to stop wars from happening and to save lives if war does happen. All who supported GROUND ZERO should support High Frontier.

The other best aspect of High Frontier is that its systems are non-nuclear. I am not one who gets upset at hearing the word "nuclear" . . . but no one in his right mind wants nuclear explosions going on over his head or anywhere on this planet.- It is happy indeed that the best defense we can devise - does not call for nuclear explosions. To save ourselves we do *not* need to blow up Moscow, we do *not* need to add to the radioactive fallout on our lovely planet.

The designers of High Frontier calculate that this new strategy will decrease our military costs. I am not in a position to judge this . . . but, frankly, I don't give a damn. A man with a burst appendix can't afford to dicker over the cost of surgery.

But will High Frontier in fact protect the Republic? As an old Research and Development engineer with the pessimism appropriate to the trade, I am certain-that most of the hardware described in the High Frontier plan will undergo many changes before it is installed; that is the way R & D always works. But I am equally certain that the problems can be solved.

The first stages of High Frontier, point defense of our missile silos, we could start building later this afternoon; it involves nothing but well-known techniques and off-the-shelf hardware. That first stage alone could save us, as it denies to an enemy a free chance to destroy us by a preemptive first strike. It forces him to thin-k twice, three times and decide not to try it.

But the key point is not whether-this hardware will do the trick;, the key lies in a change of attitude. A firm resolve to *defend* the United States . . . rather than resigning ourselves to the destruction of our beloved country. If we will so resolve, then the development of hardware is something we certainly know how to do.

But we won't get there by throwing up our hands and baring our necks to the executioner. God helps those who help themselves; he does not help those who won't try.

So let's try!

— *Robert A. Heinlein.*

1950 Where To?

Most science fiction consists of big-muscled stories about adventures in space, atomic wars, invasions by extraterrestrials, and such. All very well—but now we will take time out for a look at ordinary home life half a century hence.

Except for tea leaves and other magical means, the only way to guess at the *future* is by examining the *present* in the light of *the past.* Let's go back half a century and visit your grandmother before we attempt to visit your grandchildren.

1900: Mr. McKinley is President and the airplane has not yet been invented. Let's knock on the door of that house with the gingerbread, the stained glass, and the cupola.

The lady of the house answers. You recognize her—your own grandmother, Mrs. Middleclass. She is almost as plump as you remember her, for she "put on some good, healthy flesh" after she married.

She welcomes you and offers coffee cake, fresh from her modern kitchen (running water from a hand pump; the best coal range Pittsburgh ever produced). Everything about her house is modern—hand-painted china, souvenirs from the Columbian Exposition, beaded portières, shining baseburner stoves, gas lights, a telephone on the wall.

There is no bathroom, but she and Mr. Middleclass are thinking of putting one in. Mr. Middleclass's mother calls this nonsense, but your grandmother keeps up with the times. She is an advocate of clothing reform, wears only one petticoat, bathes twice a week, and her corsets are guaranteed rust proof. She has been known to defend female suffrage—but not in the presence of Mr. Middleclass.

Nevertheless, you find difficulty in talking with her. Let's jump back to the present and try again.

The automatic elevator takes us to the ninth floor, and we pick out a door by its number, that being the only way to distinguish it.

"Don't bother to ring," you say? What? It's *your* door and you know exactly what lies beyond it—

Very well, let's move a half century into the future and try another middle class home.

It's a suburban home not two hundred miles from the city. You pick out your destination from the air while the cab is landing you—a cluster of hemispheres that makes you think of the houses Dorothy found in Oz.

You set the cab to return to its hangar and go into the entrance hall. You neither knock nor ring. The screen has warned them before you touched down on the landing flat and the autobutler's transparency is shining with: PLEASE RECORD A MESSAGE.

Before you can address the microphone a voice calls out, "Oh, it's you! Come in, come in." There is a short wait, as your hostess is not at the door. The autobutler flashed your face to the patio—where she was reading and sunning herself—and has relayed her voice back to you.

She pauses at the door, looks at you through one-way glass, and frowns slightly; she knows your old-fashioned disapproval of casual nakedness. Her kindness causes her to disobey the family psychiatrist; she grabs a robe and covers herself before signaling the door to open.

The psychiatrist was right; you have thus been classed with strangers, tradespeople, and others who are not family intimates. But you must swallow your annoyance; you cannot object to her wearing clothes when you have sniffed at her for not doing so.

There is no reason why she should wear clothes at home. The house is clean—not somewhat clean, but *clean*—and comfortable. The floor is warm to bare feet; there are no unpleasant drafts, no cold walls. All dust is precipitated from the air entering this house. All textures, of floor, of couch, of chair, are comfortable to bare skin. Sterilizing ultraviolet light floods each room whenever it is unoccupied, and, several times a day, a "whirlwind" blows house-created dust from all surfaces and whisks it out. These auto services are unobtrusive because automatic cut-off switches prevent them from occurring whenever a mass in a room is radiating at blood temperature.

Such a house can become untidy, but not dirty. Five minutes of straightening, a few swipes at children's fingermarks, and her day's housekeeping is done. Oftener than sheets were changed in Mr. McKinley's day, this housewife rolls out a fresh layer of sheeting on each sitting surface and stuffs the discard down the oubliette. This is easy; there is a year's supply on a roll concealed in each chair or couch. The tissue sticks by pressure until pulled loose and does not obscure the pattern and color.

You go into the family room, sit down, and remark on the lovely day. "Isn't it?" she answers. "Come sunbathe with me."

The sunny patio gives excuse for bare skin by anyone's standards; thankfully she throws off the robe and stretches out on a couch. You hesitate a moment. After all, she is your own grandchild, so why not? You undress quickly, since you left your outer wrap and shoes at the door (only barbarians wear street shoes in a house) and what remains is easily discarded. Your grandparents had to get used to a midcentury beach. It was no easier for them.

On the other hand, their bodies were wrinkled and old, whereas yours is not. The triumphs of endocrinology, of cosmetics, of plastic surgery, of figure control in every way are such that a woman need not change markedly from maturity until old age. A woman can keep her body as firm and slender as she wishes—and most of them so wish. This has produced a paradox: the United States has the highest percentage of old people in all its two and a quarter centuries, yet it seems to have a larger proportion of handsome young women than ever before.

(Don't whistle, son! That's your grandmother—)

This garden is half sunbathing patio, complete with shrubs and flowers, lawn and couches, and half swimming pool. The day, though sunny, is quite cold—but not in the garden, and the pool is not chilly. The garden appears to be outdoors, but is not; it is covered by a bubble of transparent plastic, blown and cured on the spot. You are inside the bubble; the sun is outside; you cannot see the plastic.

She invites you to lunch; you protest. "Nonsense!" she answers, "I like to cook." Into the house she goes. You think of following, but it is deliciously warm in the March sunshine and you are feeling relaxed to be away from the city. You locate a switch on the side of the couch, set it for gentle massage, and let the couch knead your troubles away. The couch notes your heart rate and breathing; as they slow, so does it. As you fall asleep it stops.

Meanwhile your hostess has been "slaving away over a hot stove." To be precise, she has allowed a menu selector to pick out an 800-calorie, 4-ration-point luncheon. It is a random-choice gadget, somewhat like a slot machine, which has in it the running inventory of her larder and which will keep hunting until it turns up a balanced meal. Some housewives claim that it takes the art out of cookery, but our hostess is one of many who have accepted it thankfully as an endless source of new menus. Its choice is limited today as it has been three months since she has done grocery shopping. She rejects several menus; the selector continues patiently to turn up combinations until she finally accepts one based around fish disguised as lamb chops.

Your hostess takes the selected items from shelves or the freezer. All are prepared; some are precooked. Those still to be cooked she puts into her—well, her "processing equipment," though she calls it a "stove." Part of it traces its ancestry to diathermy equipment; another feature is derived from metal enameling processes. She sets up cycles, punches buttons, and must wait two or three minutes for the meal to cook. She spends the time checking her ration accounts.

Despite her complicated kitchen, she doesn't eat as well as her great grandmother did—too many people and too few acres.

Never mind; the tray she carries out to the patio is well laden and beautiful. You are both willing to nap again when it is empty. You wake to find that she has burned the dishes and is recovering from her "exertion" in her refresher. Feeling hot and sweaty from your nap you decide to use it when she comes out. There is a wide choice offered by the 'fresher, but you limit yourself to a warm shower growing gradually cooler, followed by warm air drying, a short massage, spraying with scent, and dusting with powder. Such a simple routine is an insult to a talented machine.

Your host arrives home as you come out; he has taken a holiday from his engineering job and has had the two boys down at the beach. He kisses his wife, shouts, "Hi, Duchess!" at you, and turns to the video, setting it to hunt and sample the newscasts it has stored that day. His wife sends the boys in to 'fresh themselves then says, "Have a nice day, dear?"

He answers, "The traffic was terrible. Had to make the last hundred miles on automatic. Anything on the phone for me?"

"Weren't you on relay?"

"Didn't set it. Didn't want to be bothered." He steps to the house phone, plays back his calls, finds nothing he cares to bother with—but the machine goes ahead and prints one message; he pulls it out and tears it off.

"What is it?" his wife asks.

"Telestat from Luna City—from Aunt Jane."

"What does she say?"

"Nothing much. According to her, the Moon is a great place and she wants us to come visit her."

"Not likely!" his wife answers. "Imagine being shut up in an airconditioned cave."

"When you are Aunt Jane's age, my honey lamb, and as frail as she is, with a bad heart thrown in, you'll go to the Moon and like it. Low gravity is not to be sneezed at—Auntie will probably live to be a hundred and twenty, heart trouble and all."

"Would *you* go to the Moon?" she asks.

"If I needed to and could afford it." He turns to you. "Right?"

You consider your answer. Life still looks good to you—and stairways are beginning to be difficult. Low gravity is attractive even though it means living out your days at the Geriatrics Foundation on the Moon. "It might be fun to visit," you answer. "One wouldn't have to stay."

Hospitals for old people on the Moon? Let's not be silly—

Or is it silly? Might it not be a logical and necessary outcome of our world today?

Space travel we will have, not fifty years from now, but much sooner. It's breathing down our necks. As for geriatrics on the Moon, for most of us no price is too high and no amount of trouble is too great to extend the years of our lives. It is possible that low gravity (one sixth, on the Moon) may not lengthen lives; nevertheless it *may*—we don't know yet—and it will most certainly add greatly to comfort on reaching that inevitable age when the burden of dragging around one's body is almost too much, or when we would otherwise resort to an oxygen tent to lessen the work of a wornout heart.

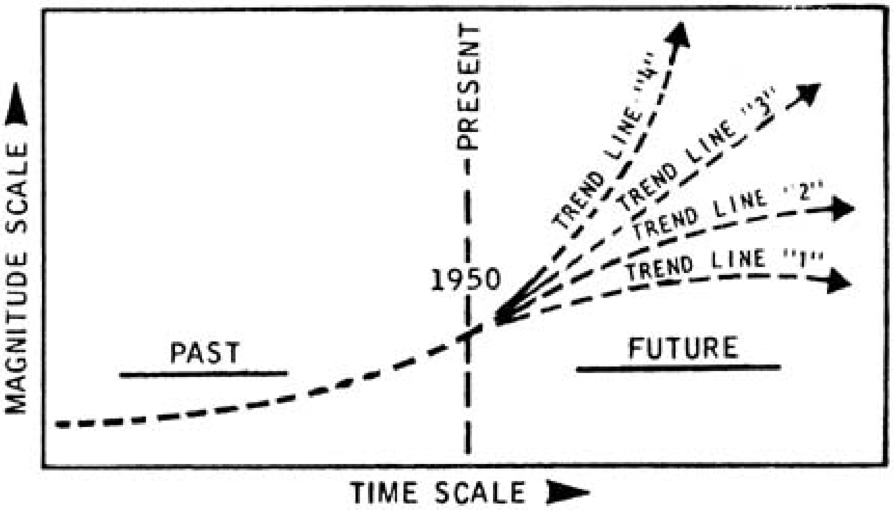
By the rules of prophecy, such a prediction is *probable,* rather than impossible.

But the items and gadgets suggested above are examples of *timid* prophecy.

What are the rules of prophecy, if any?

Look at the graph shown here. The solid curve is what has been going on this past century. It represents many things—use of power, speed of transport, numbers of scientific and technical workers, advances in communication, average miles traveled per person per year, advances in mathematics, the rising curve of knowledge. Call it the curve of human achievement.

What is the correct way to project this curve into the future? Despite everything, there is a stubborn "common sense" tendency to project it along dotted line number one—like the patent office official of a hundred years back who quit his job "because everything had already been invented." Even those who don't expect a slowing up at once tend to expect us to reach a point of diminishing returns (dotted line number two).



Very daring minds are willing to predict that we will continue our present rate of progress (dotted line number three—a tangent).

But the proper way to project the curve is dotted line number four—for there is no reason, mathematical, scientific, or historical, to expect that curve to flatten out, or to reach a point of diminishing returns, or simply to go on as a tangent. The correct projection, by all facts known today, is for the curve to go on up indefinitely with *increasing* steepness.

The timid little predictions earlier in this article actually belong to curve one, or, at most, to curve two. You can count on the changes in the next fifty years at least *eight times* as great as the changes of the past fifty years.

The Age of Science *has not yet opened.*

AXIOM: A "ninedays' wonder" is taken as a matter of course on the tenth day.

AXIOM: A "common sense" prediction is sure to err on the side of timidity.

AXIOM: The more extravagant a prediction sounds the more likely it is to come true.

So let's have a few free-swinging predictions about the future.

Some will be wrong—but cautious predictions are *sure* to be wrong.

1. **1950** Interplanetary travel is waiting at your front door—C.O.D. It's yours when you pay for it.

1965 And now we are paying for it and the cost is high. But, for reasons understandable only to bureaucrats, we have almost halted development of a nuclear-powered spacecraft when success was in sight. Never mind; if we don't another country will. By the end of this century space travel will be cheap.

1980 And now the Apollo-Saturn Man-on-theMoon program has come and gone, and all we have now in the U.S.A. as a new man-in-space program is the Space Shuttle—underfinanced and two years behind schedule. See my article SPINOFF on page 409 of this book, especially the last two pages.

Is space travel dead? *No, because the United States is not the only nation on this planet.* Today both Japan and Germany seem to be good bets—countries aware that endless wealth is out there for the taking. USSR seems to be concentrating on the military aspects rather than on space travel, and the People's Republic of China does not as yet appear to have the means to spare—but don't count out either nation; the potential is there, in both cases.

And don't count out the United States! Today most of our citizens regard the space program as a boondoggle (totally unaware that it is one of the very few Federal programs that paid for themselves, manyfold). But we are talking about twenty years from now, 2000 A.D. Let's see it in perspective. Exactly thirty years ago George Pal and Irving Pichel and I—and ca. 200 others—were making the motion picture *Destination Moon*. I remember sharply that most of the people working on that film started out thinking that it was a silly fantasy, an impossibility. I had my nose rubbed in it again and again, especially if the speaker was unaware that I had written it. (Correction: written the first version of it. By the time it was filmed, even the banker's wife was writing dialog.)

As for the general public—A trip to the *Moon?* Nonsense!

That was thirty years ago, late 1949.

Nineteen years and ten months later Apollo 11 landed on the Moon.

Look again at the curves on page 261. With respect to space travel (and industry, power, and colonization) we have dropped to that feeble curve #1—but we could shift back to curve #4 overnight *if our President and/or Congress* got it through their heads that not one but *all* of our crisis problems can be solved by exploiting space. Employment, inflation, pollution, population, energy, running out of nonrenewable resources—there is pie in the sky for the U.S.A. *and for the entire planet including the impoverished "Third World."*

I won't try to prove it here. See *The Third Industrial Revolution* by G. Harry Stine, 1979, Ace Books, 51 Madison Avenue, New York, NY 10010, and see *A Step Farther Out* by Dr. Jerry Pournelle, also Ace Books 1979—and accept my assurance that I have known both authors well for twenty-odd years, know that each has years of experience in aerospace, and that each has both the formal education and the continuing study—and the horse sense!—to be a true expert in this matter.

From almost total disbelief about space travel (99.9+%) to a landing on the Moon in twenty years . . . from President Kennedy's announcement of intention to that Lunar landing in only *seven* years . . . and still twenty years to go until the year 2000—we can still shift to curve #4 (and get rich) almost overnight. By 2000 A.D. we could have O'Neill colonies, self-supporting and exporting power to Earth, at both Lagrange-4 and Lagrange-5, transfer stations in orbit about Earth and around Luna, a permanent base on Luna equipped with an electric catapult—and a geriatrics retirement home.

However, I am not commissioned to predict what we *could* do but to predict (guess) what is *most likely* to happen by 2000 A.D.

Our national loss of nerve, our escalating anti-intellectualism, our almost total disinterest in anything that does not *directly* and *immediately* profit us, the shambles of public education throughout most of our nation (especially in New York and California) cause me to predict that *our space program will continue to dwindle.* It would not surprise me (but would distress me mightily!) to see the Space Shuttle canceled.

In the meantime some other nation or group will start exploiting space—industry, power, perhaps Lagrange-point colonies—and suddenly we will wake up to the fact that we have been left at the post. That happened to us in '57; we came up from behind and passed the competition. Possibly we will do it again. Possibly—

But I am making no cash bets.

2. **1950** Contraception and control of disease is revising relations between the sexes to an extent that will change our entire social and economic structure.

1965 This trend is so much more evident now than it was fifteen years ago that I am tempted to call it a fulfilled prophecy. Vast changes in sex relations are evident all around us—with the oldsters calling it "moral decay" and the youngsters ignoring them and taking it for granted. Surface signs: books such as *Sex and the Single Girl* are smash hits; the formerly-taboo four-letter words are now seen both in novels and popular magazines; the neologism "swinger" has come into the language; courts are conceding that nudity and semi-nudity are now parts of the cultural *mores.* But the end is not yet; this revolution will go much farther and is now barely started.

The most difficult speculation for a science fiction writer to undertake is to imagine correctly the *secondary* implications of a new factor. Many people correctly anticipated the coming of the horseless carriage; some were bold enough to predict that everyone would use them and the horse would virtually disappear. But I know of no writer, fiction or nonfiction, who saw ahead of time the vast change in the courting and mating habits of Americans which would result primarily from the automobile—a change which the diaphragm and the oral contraceptive merely confirmed. So far as I know, no one even dreamed of the change in sex habits the automobile would set off.

There is some new gadget in existence today which will prove to be equally revolutionary in some other way equally unexpected. You and I both know of this gadget, by name and by function—but we don't know which one it is nor what its unexpected effect will be. This is why science fiction is *not* prophecy—and why fictional speculation can be so much fun both to read and to write.

1980 (No, I still don't know what that revolutionary gadget is—unless it is the computer chip.) The sexual revolution: it continues apace—FemLib, GayLib, single women with progeny and never a lifted eyebrow, staid old universities and colleges that permit unmarried couples to room together on campus, group marriages, "open" marriages, miles and miles of "liberated" beaches. Most of this can be covered by one sentence: What used to be concealed is now done openly. But sexual attitudes are in flux; the new ones not yet cultural *mores.*

But I think I see a trend, one that might jell by 2000 A.D. The racial biological function of "family" is the protection of children and pregnant women. To accomplish that, family organization must be rewarding to men as well . . . and I do *not* mean copulation. There is a cynical old adage covering that: "Why keep a cow when milk is so cheap?" A marriage must offer its members emotional, spiritual, and physical comforts superior to those to be found in living alone if that prime function is to be accomplished.

(Stipulated: there are individuals, both sexes, who prefer to live alone. This is racially self-correcting.)

The American core family (father, mother, two or three children) has ceased to be emotionally satisfying—if it ever was. It is a creation of our times: mobility, birth control, easy divorce. Early in this century the core family was mother, father, four to eight children . . . and was itself a unit in an extended family of grandparents, aunts, uncles, and cousins living near enough (if not in the same house) to be mutually supportive. If a child was ill, Aunt Cora came over to help while Aunt Abby took the other kids into her home. See Mauve Decade fiction.

With increased mobility and fewer children this undefined extended-family pattern disappeared almost without its disappearance being noticed. To the extent to which it was noticed there was often glee at being free of the nuisance of in-laws and kinfolk. It took considerably longer to realize that the advantages had also disappeared.

We will not get a return of the extended family of the sort that characterized the 19th century and the early 20th . . . but the current flux of swingers' clubs, group marriages, spouse swapping, etc., is, in my opinion, fumbling and almost unconscious attempts to regain the pleasure, emotional comfort, and mutual security once found in the extended family of two or more generations back.

Prediction: by 2000 A.D. or soon thereafter extended families of several sorts will be more common than core families. The common characteristic of the various types will be increased security for children under legally enforceable contracts.

3. **1950** The most important military fact of this century is that there is no way to repel an attack from outer space.

1965 I flatly stand by this one. True, we are now working on Nike-Zeus and Nike-X and related systems and plan to spend billions on such systems—and we know that others are doing the same thing. True, it is possible to hit an object in orbit or trajectory. Nevertheless this prediction is as safe as predicting tomorrow's sunrise. Antiaircraft fire never stopped air attacks; it simply made them expensive. The disadvantage in being at the bottom of a deep "gravity well" is very great; gravity gauge will be as crucial in the coming years as wind gauge was in the days when sailing ships controlled empires. The nation that controls the Moon will control the Earth—but no one seems willing these days to speak that nasty fact out loud.

1980 I have just heard a convincing report that the USSR has developed lasers far better than ours that can blind our eyes-in-the-sky satellites and, presumably, destroy our ICBMs in flight. Stipulate that this rumor is true: It does not change my 1950 assertion one iota. Missiles tossed from the Moon to the Earth need not be H-bombs or any sort of bomb—or even missile-shaped. All they need be is massive . . . because they arrive at *approximately seven miles per second.* A laser capable of blinding a satellite and of disabling an ICBM to the point where it can't explode would need to be orders of magnitude more powerful in order to volatilize a house-size chunk of Luna. For further details see my *The Moon Is a Harsh Mistress*.

4. **1950** It is utterly impossible that the United States will start a "preventive war." We will fight when attacked, either directly or in a territory we have guaranteed to defend.

1965 Since 1950 we have done so in several theaters and are doing so in Viet Nam as this is written. "Preventive" or "preemptive" war seems as unlikely as ever, no matter who is in the White House. Here is a new prediction: World War III (as a major, all-out war) will not take place at least until 1980 and could easily hold off until 2000. This is a very happy prediction compared with the situation in 1950, as those years of grace may turn up basic factors which (I hope!) may postpone disaster still longer. We were *much* closer to ultimate disaster around 1955 than we are today—much closer indeed than we were at the time of the Cuban confrontation in 1962. But the public never knew it. All in all, things look pretty good for survival, for the time being—and that is as good a break as our ancestors ever had. It was far more dangerous to live in London in 1664–5 than it is to live in a city threatened by H-bombs today.

1980 I am forced to revise the 1950 prediction to this extent: It is no longer certain that we will fight to repel attack on territory we have guaranteed to defend; our behavior both with respect to Viet Nam and to Taiwan is a clear warning to our NATO allies. The question is not whether we should ever have been in Viet Nam or whether we should ever have allied ourselves to the Nationalist Chinese. I do not know of *any* professional military man who favored ever getting into combat on the continent of Asia; such war for us is a logistic and strategic disaster.

But to break a commitment to an ally *once it has been made* is to destroy our credibility.

5. **1950** In fifteen years the housing shortage will be solved by a "breakthrough" into new technology which will make every house now standing as obsolete as privies.

1965 Here I fell flat on my face. There has been no breakthrough in housing, nor is any now in prospect—instead the ancient, wasteful methods of building are now being confirmed by public subsidies. The degree of our backwardness in the field is hard to grasp; we have never seen a modern house. Think what an automobile would be if each one were custom-built from materials fetched to your home—what would it look like, what would it do, and how much would it cost. But don't set the cost lower than $100,000 or the speed higher than 10 m/h, if you want to be realistic about the centuries of difference between the housing industry and the automotive industry.

I underestimated (through wishful thinking) the power of human stupidity—a fault fatal to prophecy.

1980 I'm still flat on my face with my nose rubbed in the mud; the situation is worse than ever. See "A Bathroom of Her Own" on page 198. And that figure of $100,000 just above was with gold at $35 per troy ounce—so change it to one million dollars—or call it 2700 troy ounces of gold. Or forget it. The point is that it would be very nearly impossible to build even a clunker automobile at any price if we built them the way we build houses.

We have the technology to build cheap, beautiful, efficient, flexible (modular method) houses, extremely comfortable and with the durability of a Rolls Royce. But I cannot guess when (if ever) the powers that be (local bureaucrats, unions, building materials suppliers, county and state officials) will permit us poor serfs to have modern housing.

6. **1950** We'll all be getting a little hungry by and by.

1965 No new comment.

1980 Not necessarily. In 1950 I was too pessimistic concerning population. Now I suspect that the controlling parameter is oil. In modern agriculture oil is the prime factor—as power for farm machinery (obviously) but also for insecticides and for fertilizers. Since our oil policies in Washington are about as boneheaded—counterproductive—as they can be, I have no way to guess how much food we can raise in 2000 A.D. But no one in the United States should be hungry in 2000 A.D.—unless we are conquered and occupied.

7. **1950** The cult of the phony in art will disappear. So-called "modern art" will be discussed only by psychiatrists.

1965 No new comment.

1980 One may hope. But art reflects culture and the world is even nuttier now than it was in 1950; these are the Crazy Years. But, while "fine" art continues to look like the work of retarded monkeys, commercial art grows steadily better.

8. 1950 Freud will be classed as a prescientific, intuitive pioneer and psychoanalysis will be replaced by a growing, changing "operational psychology" based on measurement and prediction.

1965 No new comment.

1980 This prediction is beginning to come true. Freud is no longer taken seriously by informed people. More and more professional psychologists are skilled in appropriate mathematics; most of the younger ones understand inductive methodology and the nature of scientific confirmation and are trying hard to put rigor into their extremely difficult, still inchoate subject. For some of the current progress see Dr. Pournelle's book, cited on page 263.

By 2000 A.D. we will know a great deal about how the brain functions . . . whereas in 1900 what little we knew was wrong.

I do *not* predict that the basic mystery of psychology—how mass arranged in certain complex patterns becomes aware of itself—will be solved by 2000 A.D. I hope so but do not expect it.

9. **1950** Cancer, the common cold, and tooth decay will all be conquered; the revolutionary new problem in medical research will be to accomplish "regeneration," i.e., to enable a man to grow a new leg, rather than fit him with an artificial limb.

1965 In the meantime spectacular progress has been made in organ transplants—and the problem of regeneration is related to this one. Biochemistry and genetics have made a spectacular breakthrough in "cracking the genetic code." It is a tiny crack, however, with a long way to go before we will have the human chromosomes charted and still longer before we will be able to "tailor" human beings by gene manipulation. The possibility is there—but not by year 2000. This is probably just as well. If we aren't bright enough to build decent houses, are we bright enough to play God with the architecture of human beings?

1980 I see no reason to change this prediction if you will let me elaborate (weasel) a little. "The common cold" is a portmanteau expression for upper respiratory infections which appear to be caused by a very large number of different viruses. Viruses are pesky things. It is possible to immunize against them, e.g., vaccination against smallpox, a virus disease. But there are almost no chemotherapies, medicines, against viruses. That is why "the common cold" is treated much the same way today as in 1900, i.e., support the patient with bed rest, liquids, aspirin to make him more comfortable, keep him warm. This was standard in 1900 and it is still standard in 1980.

It is probable that your body makes antibodies against the virus of any cold you catch. But this gives you no protection against that virus's hundreds of close relatives found in any airport, theater, supermarket, or gust of dust off the street. In the meantime, while his kinfolk take turns making you miserable, virus #1 has mutated and you have no antibodies against the mutation.

Good news: Oncology (cancer), immunology, hematology, and "the common cold" turn out to be strongly interrelated subjects; research in all these is moving fast—and a real breakthrough in any one might mean a breakthrough in all.

10. **1950** By the end of this century mankind will have explored this solar system, and the first ship intended to reach the nearest star will be a building.

1965 Our editor suggested that I had been too optimistic on this one—but I still stand by it. It is still thirty-five years to the end of the century. For perspective, look back thirty-five years to 1930—the American Rocket Society had not yet been founded. Another curve, similar to the one herewith in shape but derived entirely from speed of transportation, extrapolates to show faster-than-light travel by year 2000. I guess I'm chicken, for I am not predicting FTL ships by then, if ever. But the prediction still stands without hedging.

1980 My money is still on the table at twenty years and counting. Senator Proxmire can't live forever. In the last 10½ years men have been to the Moon several times; much of the Solar system has been most thoroughly explored within the limits of "black box" technology and more will be visited before this year is out.

Ah, but not explored by *men*—and the distances are so great. Surely they are . . . by free-fall orbits, which is all that we have been using. But there are numerous proposals (and not all ours!) for constant-boost ships, proposals that require R&D on present art only—

no breakthroughs.

Reach for your pocket calculator and figure how long it would take to make a trip to Mars and back if your ship could boost at one-tenth gee. We will omit some trivia by making it from parking orbit to parking orbit, use straight-line trajectories, and ignore the Sun's field —we'll be going uphill to Mars, downhill to Earth; what we lose on the roundabouts we win on the shys.

These casual assumptions would cause Dan Alderson, ballistician at Jet Propulsion Laboratory, to faint. But after he comes out of his faint he would agree that our answers would be of correct close order of magnitude—and all I'm trying to prove is that even a slight constant boost makes an enormous difference in touring the Solar System. (Late in the 21st century we'll offer the Economy Tour: Ten Planets in Ten Days.)

There are an unlimited number of distances between rather wide parameters for an Earth-Mars-Earth trip but we will select one that is nearly minimum (it's cheating to wait in orbit at Mars for about a year in order to take the shortest trip each way . . . and unthinkable to wait years for the closest approach). We'll do this Space Patrol style: There's Mars, here we are at L-5; let's scoot over, swing around Mars, and come straight home. Just for drill.

Conditions: Earth-surface gravity (one "gee") is an acceleration of 32.2 feet per second squared, or 980.7 centimeters per second squared. Mars is in or near opposition (Mars is rising as Sun is setting). We will assume that the round trip is 120,000,000 miles. If we were willing to wait for closest approach we could trim that to less than 70,000,000 miles . . . but we might have to wait as long as 17 years. So we'll take a common or garden variety opposition—one every 26 months—for which the distance to Mars is about 50-to 60,000,000 miles and never over 64 million.

(With Mars in conjunction on the far side of the Sun, we could take the scenic route of over 500 million miles—how much over depends on how easily you sunburn. I suggest a minimum of 700 million miles.)

You now have all necessary data to figure the time it takes to travel Earth-Mars-Earth in a constant-boost ship—*any* constant-boost ship—when Mars is at opposition. (If you insist on the scenic route, you can't treat the trajectory approximations as straight lines and you can't treat space as flat but a bit uphill. You'll need Alderson or his equal and a *big* computer, not a pocket calculator; the equations are very hairy and sometimes shoot back.)

But us two space cadets are doing this by eyeballing it, using Tennessee windage, an aerospace almanac, a Mickey Mouse watch, and an SR-50 Pop discarded years ago.

We need just one equation: Velocity equals acceleration times elapsed time: $v = at$

This tells us that our average speed is ½at—and from that we know that the distance achieved is the average speed times the elapsed time: $d = ½at^2$

If you don't believe me, check any physics text, encyclopedia, or nineteen other sorts of reference books—and I did that derivation without cracking a book but now I'm going to stop and find out whether I've goofed—I've had years of practice in goofing. (Later—seems okay.)

Just two things to remember: 1) This is a 4-piece trip—boost to midpoint, flip over and boost to brake; then do the same thing coming home. Treat all four legs as being equal or 30,000,000 miles, so figure one of them and multiply by four (Dan, stop frowning; this is an *approximation* . . . done with a Mickey Mouse watch.)

2) You must keep your units straight. If you start with centimeters, you are stuck with centimeters; if you start with feet, you are stuck with feet. So we have ¼ of the trip equals $5280 \times 30{,}000{,}000 = 1.584 \times 10^{11}$ feet, or 4.827×10^{12} centimeters.

One last bit: Since it is elapsed time we are after, we will rearrange that equation ($d = ½at^2$) so that you can get the answer in one operation on your trusty-but-outdated pocket calculator . . . or even on a slide rule, as those four-significant-figures data are mere swank; I've used so many approximations and ignored so many minor variables that I'll be happy to get answers correct to two significant figures.

$$\frac{d}{½a} = t^2 \text{ This gives us: } \sqrt{d / ½a}$$

d is 30,000,000 miles expressed in feet, or 158,400,000,000. Set that into your pocket calculator. Divide it by one half of one tenth of gee, or 1.61. Push the square root button. Multiply by 4. You now have the elapsed time of the round trip expressed in seconds so divide by 3600 and you have it in hours, and divide that by 24 and you have it in days.

At this point you are supposed to be astonished and to start looking for the mistake. While you are looking, I'm going to slide out to the refrigerator.

There is no mistake. Work it again, this time in metric. Find a reference book and check the equation. You will find the answer elsewhere in this book but don't look for it yet; we'll try some other trips you may take by 2000 A.D. if you speak Japanese or German—or even English if Proxmire and his ilk fail of reelection.

Same trip, worked the same way, but at only one percent of gee. At that boost I would weigh less than my shoes weigh here in my study.

Hmmph! Looks as if one answer or the other must be wrong.

Bear with me. This time we'll work it at a full gee, the acceleration you experience lying in bed, asleep. (See Einstein's 1905 paper.)

(Preposterous. All three answers must be wrong.)

Please stick with me a little longer. Let's run all three problems for a round trip to Pluto—in 2006 A.D., give or take a year. Why 2006? Because today Pluto has ducked inside the orbit of Neptune and won't reach perihelion until 1989—and I want it to be a bit farther away; I've got a rabbit stashed in the hat.

Pluto ducks outside again in 2003 and by 2006 it will be (give or take a few million miles) 31.6 A.U. from the Sun, figuring an A.U. at 92,900,000 miles or 14,950,000,000,000 centimeters as we'll work this both ways, MKS and English units. (All right, all right—1.495×10^{13} centimeters; it gets dull here at this typewriter.)

Now work it all three ways, a round trip of 63.2 A.U. at a constant boost of one gravity, one tenth gravity, and one hundredth of a gee—and we'll dedicate this to Clyde Tombaugh, the only living man to discover a new planet—through months of tedious and painstaking examination of many thousands of films.

Some think that Pluto was once a satellite and its small size makes this possible. But it is *not* a satellite today. It is both far too big and hundreds of millions of miles out of position to be an asteroid. It can't be a comet. So it's a planet—or something so exotic as to be still more of a prize.

Its size made it hard to find and thus still more of an achievement. But Tombaugh continued the search for seventeen weary years and many millions more films. If there is an Earth-size planet out there, it is at least three times as distant as Pluto, and a gas giant would have to be six times as far. Negative data win no prizes but they are the bedrock of science.

Until James W. Christy on 22 June 1978 discovered Pluto's satellite, Charon, it was possible for us romantics to entertain the happy thought that Pluto was loaded with valuable heavy metals; the best estimate of its density made this plausible. But the mass of a planet with a satellite can be calculated quite easily and accurately, and from that, its density.

The new figure was much too low, only half again as heavy as water. Methane snow? Perhaps.

So once again a lovely theory is demolished by an awkward fact.

Nevertheless Pluto remains a most mysterious and most intriguing heavenly body. A planet the size and mass of Mars might not be too much use to us out there . . . but think of it as a fuel dump. Many stories and many nonfictional projections speak of using the gas giants and/or the rings of Saturn as sources of fuel. But if Pluto is methane ice or water ice or frozen hydrogen or all three, as a source of fuel—conventional, or fusion, or even reaction mass—Pluto has one supremely important advantage over the gas giants: Pluto is *not* at the bottom of a horridly deep gravity well.

Finished calculating? Good. Please turn to page 299 and see why I wanted our trip to Pluto to be a distance of 31.6 A.U.—plus other goodies, perhaps.

11. **1950** Your personal telephone will be small enough to carry in your handbag. Your house telephone will record messages, answer simple inquiries, and transmit vision.

1965 No new comment.

1980 This prediction is trivial and timid. Most of it has already come true and the telephone system will hand you the rest on a custom basis if you'll pay for it. In the year 2000, with modern telephones tied into home computers (as common then as flush toilets are today) you'll be able to have 3-dimensional holovision along with stereo speech. Arthur C. Clarke says that this will do away with most personal contact in business. I agree with all of Mr. Clarke's arguments and disagree with his conclusion; with us monkey folk there is no substitute for personal contact; we enjoy it and it fills a spiritual need.

Besides that, the business conference is often an excuse to loaf on the boss's time and the business convention often supplies some of the benefits of the Roman Saturnalia.

Nevertheless I look forward to holovideostereophones *without* giving up personal contacts.

12. **1950** Intelligent life will be found on Mars.

1965 Predicting intelligent life on Mars looks pretty silly after those dismal photographs. But I shan't withdraw it until Mars has been *thoroughly* explored. As yet we really have no idea—and no data—as to just how ubiquitous and varied life may be in this galaxy; it is conceivable that life as we *don't* know it can evolve on *any* sort of a planet . . . and nothing in our present knowledge of chemistry rules this out. All the talk has been about life-as-we-know-it—which means terrestrial conditions.

But if you feel that this shows in me a childish reluctance to give up thoats and zitidars and beautiful Martian princesses until forced to, I won't argue with you—I'll just wait.

1980 The photographs made by the Martian landers of 1976 and their orbiting companions make the prediction of intelligent Martian life look even sillier. But the new pictures and the new data make

Mars even more mysterious. I'm a diehard because I suspect that life is ubiquitous—call that a religious opinion if you wish. But remember two things: Almost all discussion has been about Life-as-we-know-it . . . but what about Life-as-we-*don't*-know-it? If there were Martians around the time that those amazing gullies and canyons were formed, perhaps they went underground as their atmosphere thinned. At present, despite wonderful pictures, our data are very sparse; those two fixed landers are analogous to two such landing here: one on Canadian tundra, the other in Antarctica—hardly sufficient to solve the question: Is there intelligent life on Sol III?

(Is there intelligent life in Washington, D.C.?)

Whistling in the dark—I think I goofed on this one. But if in fact Mars is uninhabited, shortly there will be a land rush that will make the Oklahoma land stampede look gentle. Since $E = mc^2$ came into our lives, *all* real estate is potentially valuable; it can be terraformed to suit humans. There has been so much fiction and serious, able nonfiction published on how to terraform Mars that I shan't add to it, save to note one thing:

Power is no problem. Sunshine at that distance has dropped off to about 43% of the maximum here—but Mars gets *all* of it and gets it all day long save for infrequent dust storms . . . whereas the *most* that Philadelphia (and like places) ever gets is 35%—and overcast days are common. Mars won't need solar power from orbit; it will be easier to do it on the ground.

But don't be surprised if the Japanese charge you a very high fee for stamping their visa into your passport plus requiring deposit of a prepaid return ticket or, if you ask for immigrant's visa, charge you a much, much higher fee plus proof of a needed colonial skill.

For there *is* intelligent life in Tokyo.

13. **1950** A thousand miles an hour at a cent a mile will be commonplace; short hauls will be made in evacuated subways at extreme speed.

1965 I must hedge number thirteen; the "cent" I meant was scaled by the 1950 dollar. But our currency has been going through a long steady inflation, and no nation in history has ever gone as far as we have along this route without reaching the explosive phase of inflation. Ten-dollar hamburgers? Brother, we are headed for the hundred-dollar hamburger—for the barter-only hamburger.

But this is only an inconvenience rather than a disaster as long as there is plenty of hamburger.

1980 I must scale that "cent" again. In 1950 gold was $35/troy ounce; this morning the London fix was $374/troy ounce. Just last week my wife and I flew San Francisco to Baltimore and return. We took neither the luxury class nor any of the special discounted fares;

we simply flew what we could get.

Applying the inflation factor—35/374—our tickets cost a hair less than one cent a mile in *1950* dollars. From here on I had better give prices in troy ounces of gold, or in Swiss francs; not even the Man in the White House knows where this inflation is going. About those subways: possible, even probable, by 2000 A.D. But I see little chance that they will be financed until the dollar is stabilized—a most painful process our government hates to tackle.

14. **1950** A major objective of applied physics will be to control gravity.

1965 This prediction stands. But today physics is in a tremendous state of flux with new data piling up faster than it can be digested; it is anybody's guess as to where we are headed, but the wilder you guess, the more likely you are to hit it lucky. With "elementary particles" of nuclear physics now totaling about half the number we used to use to list the "immutable" chemical elements, a spectator needs a program just to keep track of the players. At the other end of the scale, "quasars"—quasi-stellar bodies—have come along; radio astronomy is now bigger than telescopic astronomy used to be; and we have redrawn our picture of the universe several times, each time enlarging it and making it more complex—I haven't seen this week's theory yet, which is well, as it would be out of date before this gets into print. Plasma physics was barely started in 1950; the same for solid-state physics. This is the Golden Age of physics—and it's an anarchy.

1980 I stick by the basic prediction. There is so much work going on both by mathematical physicists and experimental physicists as to the nature of gravity that it seems inevitable that twenty years from now applied physicists will be trying to control it. But note that I said "trying"—succeeding may take a long time. If and when they do succeed, a spinoff is likely to be a spaceship that is in no way a rocket ship—and the Galaxy is ours! (Unless we meet that smarter, meaner, tougher race that kills us or enslaves us or eats us—or all three.)

Particle physics: the situation is even more confusing than in 1965. Physicists now speak of more than 200 kinds of hadrons, "elementary" heavy particles. To reduce this confusion a mathematical construct called the "quark" was invented. Like Jell-O quarks come in many colors and flavors . . . plus spin, charm, truth, and beauty (or top and bottom in place of truth and beauty—or perhaps "truth" doesn't belong in the list, and no jokes, please, as the physicists aren't joking and neither am I). Put quarks together in their many attributes and you can account for (maybe) all those 200-odd hadrons (and have a system paralleling the leptons or light particles as a bonus).

All very nice . . . except that no one has ever been able to pin down even one quark. Quarks, if they exist, come packaged in clumps as hadrons—not at random but by rules to account for each of that mob of hadrons.

Now comes Kenneth A. Johnson, Ph.D. (Harvard '55), Professor of Physics at the Massachusetts Institute of Technology (which certainly places him in the worldwide top group of physicists) with an article *(Scientific American,* July 1979, p. 112, "The Bag Model of Quark Confinement"), an article which appears to state that quarks will never be pinned down because they are in sort of an eternal purdah, never to be seen even as bubble tracks.

Somehow it reminds me of the dilemma when the snark is a boojum.

I'm not poking fun at Dr. Johnson; he is very learned and trying hard to explain his difficult subject to the unlearned such as I.

But, in the meantime I suggest reading *The Hunting of the Snark* while waiting patiently for 2000 A.D. We have a plethora of data; perhaps in twenty more years the picture will be simplified. Perhaps—

15. **1950** We will not achieve a "World State" in the predictable future. Nevertheless, Communism will vanish from this planet.

1965 I stand flatly behind prediction number fifteen.

1980 I still stand flatly behind the first sentence of that two-part prediction above. The second part I could weasel out of by pointing out that on this planet *no* state that calls itself Marxist or Socialist or Communist has ever established a system approximating that called for by the works of Karl Marx and Friedrich Engels. And never will; Marx's Utopia does not fit human beings. The state will not "wither away."

But I shan't weasel as I am utterly dismayed by the political events of the past 15–20 years. At least two thirds of the globe now calls itself Marxist. Another large number of countries are military dictatorships. Another large group (including the United States) are constitutional democratic republics but so heavily tinged with socialism ("welfare state") that all of them are tottering on the brink of bankruptcy and collapse.

So far as I can see today the only thing that could cause the soidisant Marxist countries to collapse in as little time as twenty years would be for the United States to be conquered and occupied by the USSR—and twenty years ago I thought that this was a strong possibility. (I'm more optimistic now, under the present three-cornered standoff.)

If we were to be conquered and occupied, the Communist world might collapse rather quickly. We have been propping them up whenever they were in real trouble (frequently!) for about half a century.

16. **1950** Increasing mobility will disenfranchise a majority of the population. About 1990 a constitutional amendment will do away with state lines while retaining the semblance.

1965 No further comment.

1980 I goofed. I will be much surprised if either half of this double prediction comes to pass by 2000—at least in the form described and for the reasons I had in mind. The franchise now extends to any warm body over eighteen years of age and that franchise can be transferred to another state in less time than it takes the citizen to find housing in his/her new state.

Thus no constitutional amendment is needed. But the state lines are fading year by year anyhow as power continues to move from the states to the Federal government and especially into the hands of non-elected bureaucrats.

17. **1950** All aircraft will be controlled by a giant radar net run on a continent-wide basis by a multiple electronic "brain."

1965 No further comment.

1980 This prediction still stands—although it may be my wishful thinking. Such a system was designed over thirty years ago; Congress wouldn't buy it. It would be more expensive today . . . and is far more urgently needed. Anyone who has ever been in the tower of a busy field or has ever ridden in the "office" of a commercial plane during a takeoff or landing at a busy field knows what I mean. All our fields are overloaded but anyone who goes in or out of San Diego or of O'Hare-Chicago or—but why go on? Our airplanes are pretty durn wonderful . . . but our method of handling air traffic at fields is comparable to Manhattan without traffic lights.

I shall continue to fly regularly for two reasons: 1) Mrs. Heinlein and I hope to go out in a common disaster. 2) Consider the alternatives: AMTRAK (ugh!), buses (two ughs!), and driving oneself. The latter is fine for short distances (OPEC and Washington permitting) but, while in my younger days I drove across this continent so many times that I've lost count, today I am no longer physically up to such a trip even with a chauffeur.

But that totally-automated traffic control system *ought* to be built. Expensive, yes—but what price do we place on a hundred dead passengers, a flight crew, and a modern airliner? In the present state of the art in computers and in radar neither the pilot nor the controller should be in the loop at landing or takeoff; they should simply be alert, ready to override, because even the most perfect machinery is subject to Murphy's Law. But all routine (99.9+%) takeoffs and landings should be made by computer.

If this pushes small private planes onto separate and smaller fields, so be it. Bicycles do not belong on freeways. I hate to say that, as there is nothing more fun than a light sports plane.

(Nothing that is not alive, I mean. Vive la difference!)

(On air traffic control I speak with a modicum of authority. I returned to the aircraft industry for a short time in 1948 to research this subject, then wrote an article aimed at the slicks: "The Billion-Dollar Eye." I missed; it is still unpublished.)

18. **1950** Fish and yeast will become our principal sources of proteins. Beef will be a luxury; lamb and mutton will disappear.

1965 I'll hedge number eighteen a little. Hunger is not now a problem in the USA and need not be in the year 2000—but hunger *is* a world problem and would at once become an acute problem for us if we were conquered . . . a distinct possibility by 2000. Between our present status and that of subjugation lies a whole spectrum of political and economic possible shapes to the future under which we would share the worldwide hunger to a greater or lesser extent. And the problem grows. We can expect to have to feed around half a billion Americans circa year 2000—our present huge surpluses would then represent acute shortages even if we never shipped a ton of wheat to India.

1980 It would now appear that the USA population in 2000 A.D. will be about 270,000,000 instead of 500,000,000. I have been collecting clippings on demography for forty years; all that the projections have in common is that all of them are wrong. Even that figure of 270,000,000 may be too high; today the only reason our population continues to increase is that we oldsters are living longer; our current birthrate is not sufficient even to replace the parent generation.

19. **1950** Mankind will *not* destroy itself, nor will "Civilization" be destroyed.

1965 I stand by prediction number nineteen.

1980 I still stand by prediction number nineteen. There will be wars and we will be in some of them—and some may involve atomic weapons. But there will *not* be that all-destroying nuclear holocaust that forms the background of so many SF stories. There are three reasons for this: The United States, the Soviet Union, and the People's Republic of China.

Why? Because the three strongest countries in the world (while mutually detesting each the other two) have nothing to gain and everything to lose in an all-out swapping of H-bombs. Because Kremlin bosses are not idiots and neither are those in Beijing (Peiping) (Peking).

If another country—say Israel, India, or the South African Republic—gets desperate and tosses an A-or H-bomb, that country is likely to receive three phone calls simultaneously, one from each of the Big

Three: "You have exactly three minutes to back down. Then we destroy you."

After World War II I never expected that our safety would ever depend on a massive split in Communist International—but that is exactly what has happened.

1950 Here are things we *won't* get soon, if ever:

Travel through time.

Travel faster than the speed of light.

"Radio" transmission of matter.

Manlike robots with manlike reactions.

Laboratory creation of life.

Real understanding of what "thought" is and how it is related to matter.

Scientific proof of personal survival after death.

Nor a permanent end to war. (I don't like that prediction any better than you do.)

1950 Prediction of gadgets is a parlor trick anyone can learn; but only a fool would attempt to predict details of future history (except as fiction, so labeled); there are too many unknowns and no techniques for integrating them even if they were known.

Even to make predictions about overall trends in technology is now most difficult. In fields where before World War II there was one man working in public, there are now ten, or a hundred, working in secret. There may be six men in the country who have a clear picture of what is going on in science today. *There may not be even one.*

This is in itself a trend. Many leading scientists consider it a factor as disabling to us as the nonsense of Lysenkoism is to Russian technology. Nevertheless there are clear-cut trends which are certain to make this coming era enormously more productive and interesting than the frantic one we have just passed through. Among them are:

Cybernetics: The study of communication and control of mechanisms and organisms. This includes the wonderful field of mechanical and electronic "brains"—but is not limited to it. (These "brains" are a factor in themselves that will speed up technical progress the way a war does.)

Semantics: A field which seems concerned only with definitions of words. It is not; it is a frontal attack on epistemology—that is to say, *how* we know *what* we know, a subject formerly belonging to longhaired philosophers.

New tools of mathematics and logic, such as calculus of statement, Boolean logic, morphological analysis, generalized symbology, newly invented mathematics of every sort—there is not space even to name these enormous fields, but they offer us hope in every field—medicine, social relations, biology, economics, anything.

Biochemistry: Research into the nature of protoplasm, into enzyme chemistry, viruses, etc., give hope not only that we may conquer disease, but that we may someday understand the mechanisms of life itself. Through this, and with the aid of cybernetic machines and radioactive isotopes, we may eventually acquire a rigor of chemistry. Chemistry is not a discipline today; it is a jungle. We know that chemical behavior depends on the number of orbital electrons in an atom and that physical and chemical properties follow the pattern called the Periodic Table. We don't know much else, save by cut-and-try, despite the great size and importance of the chemical industry. When chemistry becomes a discipline, mathematical chemists will design new materials, predict their properties, and tell engineers how to make them—without ever entering a laboratory. We've got a *long* way to go on that one!

Nucleonics: We have yet to find out what makes the atom tick. Atomic power?—yes, we'll have it, in convenient packages—when we understand the nucleus. The field of radioisotopes alone is larger than was the entire known body of science in 1900. Before we are through with these problems, we may find out how the universe is shaped and *why.* Not to mention enormous unknown vistas best represented by ?????

Some physicists are now using two time scales, the T-scale, and the tau-scale. Three billion years on one scale can equal an incredibly split second on the other scale—and yet both apply to you and your kitchen stove. Of such anarchy is our present state in physics.

For such reasons we must insist that *the Age of Science has not yet opened.*

(Still 1950) The greatest crisis facing us is not Russia, not the Atom Bomb, not corruption in government, not encroaching hunger, not the morals of young. It is a crisis in the *organization* and *accessibility* of human knowledge. We own an enormous "encyclopedia"—which isn't even arranged alphabetically. Our "file cards" are spilled on the floor, nor were they ever in order. The answers we want may be buried somewhere in the heap, but it might take a lifetime to locate two already known facts, place them side by side and derive a third fact, the one we urgently need.

Call it the Crisis of the Librarian.

We need a new "specialist" who is not a specialist, but a synthesist. We need a new science to be the perfect secretary to all other sciences.

But we are not likely to get either one in a hurry and we have a powerful lot of grief before us in the meantime.

Fortunetellers can always be sure of repeat customers by predicting what the customer wants to hear . . . it matters not whether the prediction comes true. Contrariwise, the weatherman is often blamed for bad weather.

Brace yourself.

In 1900 the cloud on the horizon was no bigger than a man's hand—but what lay ahead was the Panic of 1907, World War I, the panic following it, the Depression, Fascism, World War II, the Atom Bomb, and Red Russia.

Today the clouds obscure the sky, and the wind that overturns the world is sighing in the distance.

The period immediately ahead will be the roughest, cruelest one in the long, hard history of mankind. It will probably include the worst World War of them all. It might even end with a war with Mars, God save the Mark! Even if we are spared that fantastic possibility, it is certain that there will be no security anywhere, save that which you dig out of your own inner spirit.

But what of that picture we drew of domestic luxury and tranquility for Mrs. Middleclass, style 2000 A.D.?

She lived through it. She survived.

Our prospects need not dismay you, not if you or your kin were at Bloody Nose Ridge, at Gettysburg—or trudged across the Plains. You and I are here because we carry the genes of uncountable ancestors who fought—and won—against death in all its forms. We're tough. We'll survive. Most of us.

We've lasted through the preliminary bouts; the main event is coming up.

But it's not for sissies.

The last thing to come fluttering out of Pandora's Box was Hope—without which men die.

The gathering wind will not destroy everything, nor will the Age of Science change everything. Long after the first star ship leaves for parts unknown, there will still be outhouses in upstate New York, there will still be steers in Texas, and—no doubt—the English will still stop for tea.

Afterthoughts, fifteen years later—(1965)

I see no reason to change any of the negative predictions which follow the numbered affirmative ones. They are all conceivably possible; they are all wildly unlikely by year 2000. Some of them are debatable if the terms are defined to suit the affirmative side—definitions of "life" and "manlike," for example. Let it stand that I am not talking about an amino acid in one case, or a machine that plays chess in the other.

Today the forerunners of synthesists are already at work in many places. Their titles may be anything; their degrees may be in anything—or they may have no degrees. Today they are called "operations researchers," or sometimes "systems development engineers," or other interim tags. But they are all interdisciplinary people, generalists, not specialists—the new Renaissance Man. The very explosion of data which forced most scholars to specialize very narrowly created the necessity which evoked this new non-specialist. So far, this "unspecialty" is in its infancy; its methodology is inchoate, the results are sometimes trivial, and no one knows how to train to become such a man. But the results are often spectacularly brilliant, too—this new man may yet save all of us.

I'm an optimist. I have great confidence in Homo sapiens.

We have rough times ahead—but when didn't we? Things have always been "tough all over." H-bombs, Communism, race riots, water shortage—all nasty problems. But not basic problems, merely current ones.

We have three basic and continuing problems: The problem of population explosion; the problem of data explosion; and the problem of government.

Population problems have a horrid way of solving themselves when they are not solved rationally; the Four Horsemen of the Apocalypse are always saddled up and ready to ride. The data explosion is now being solved, mostly by cybernetics and electronics men rather than by librarians—and if the solutions are less than perfect, at least they are better than what Grandpa had to work with. The problem of government has not been solved either by the "Western Democracies" or the "People's Democracies," as of now. (Anyone who thinks the people of the United States have solved the problem of government is using too short a time scale.) The peoples of the world are now engaged in a long, long struggle with no end in sight, testing whether one concept works better than another; in that conflict millions have already died and it is possible that hundreds of millions will die in it before year 2000. But not all.

I hold both opinions and preferences as to the outcome. But my personal preference for a maximum of looseness is irrelevant; what we are experiencing is an evolutionary process in which personal preference matters, at most, only statistically. Biologists, ecologists in particular, are working around to the idea that natural selection and survival of the fittest is a notion that applies more to groups and how they are structured than it does to individuals. The present problem will solve itself in the cold terms of evolutionary survival, and in the course of it both sides will make changes in group structure. The system that survives might be called "Communism" or it might be called "Democracy" (the latter is my guess)—but one thing we can be certain of: it will not resemble very closely what either Marx or Jefferson had in mind. Or it might be called by some equally inappropriate neologism; political tags are rarely logical.

For Man is rarely logical. But I have great confidence in Man, based on his past record. He is mean, ornery, cantankerous, illogical, emotional—and amazingly hard to kill. Religious leaders have faith in the spiritual redemption of Man; humanist leaders subscribe to a belief in the perfectibility of Man through his own efforts; but I am not discussing either of these two viewpoints. My confidence in our species lies in its past history and is founded quite as much on Man's so-called vices as on his so-called virtues. When the chips are down, quarrelsomeness and selfishness can be as useful to the survival of the human race as is altruism, and pigheadedness can be a trait superior to sweet reasonableness. If this were not true, these "vices" would have died out through the early deaths of their hosts, at least a half million years back.

I have a deep and abiding confidence in Man as he is, imperfect and often unlovable—plus still greater confidence in his potential. No matter how tough things are, Man copes. He comes up with adequate answers from illogical reasons. But the answers work.

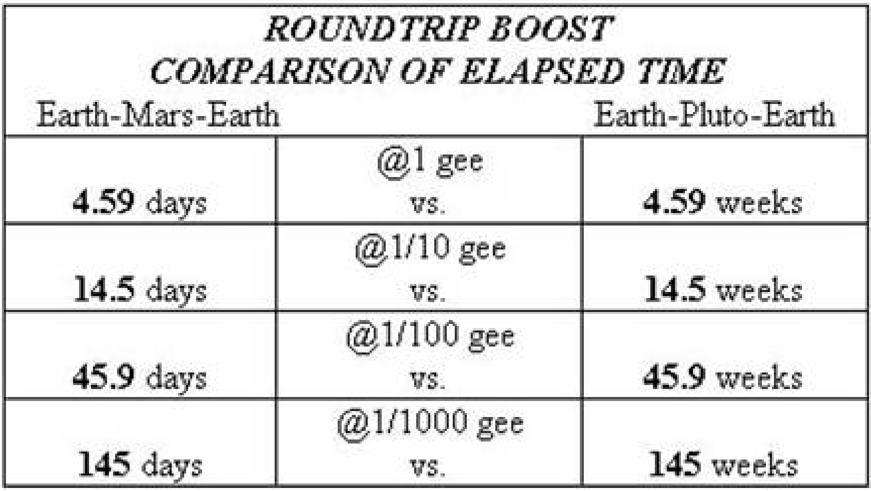
Last to come out of Pandora's Box was a gleaming, beautiful thing —eternal Hope.

(1980—I see no point in saying more. R.A.H.)

THE ANSWERS

N.B.: All trips are Earth parking orbit to Earth parking orbit without stopping at the target planet (Mars or Pluto). I assume that Hot Pilot Tom Corbett will handle his gravity-well maneuvers at Mars and at Pluto so as not to waste mass-energy—but that's his problem. Now about that assumption of "flat space" only slightly uphill: The Sun has a fantastically deep gravity well; its "surface" gravity is 28 times as great as ours and its escape speed is 55+ times as great—but at the distance of Earth's orbit that grasp has attenuated to about one thousandth of a gee, and at Pluto at 31.6 A.U. it has dropped off to a gnat's whisker, one *millionth* of gee.

(No wonder it takes 2½ centuries to swing around the Sun. By the way, some astronomers seem positively gleeful that *today* Pluto is not the planet farthest from the Sun. The facts: Pluto spends nine-tenths of its time outside Neptune's orbit, and it averages being 875,000,000 miles farther out than Neptune—and at maximum is nearly 2 billion miles beyond Neptune's orbit (1.79 x 10^9 miles)—friends, that's more than the distance from here to Uranus, nearly four times as far as from here to Jupiter. When Pluto is out there—1865 or 2114 A.D.—it takes light 6 hours and 50 minutes to reach it. Pluto—the Winnuh and still Champeen! Sour grapes is just as common among astronomers as it is in school yards.)



ROUNDTRIP BOOST
COMPARISON OF ELAPSED TIME

Earth-Mars-Earth		Earth-Pluto-Earth
4.59 days	@1 gee vs.	**4.59** weeks
14.5 days	@1/10 gee vs.	**14.5** weeks
45.9 days	@1/100 gee vs.	**45.9** weeks
145 days	@1/1000 gee vs.	**145** weeks

—and the rabbit is out of the hat. You will have noticed that the elapsed-time figures are exactly the same in both columns, but in days for Mars, weeks for Pluto—i.e., with constant-boost ships of any sort Pluto is *only 7 times* as far away for these conditions as is Mars *even though in miles Pluto is about 50 times as far away.*

If you placed Pluto at its aphelion (stay alive another century and a quarter—quite possible), at one gee the Pluto round trip would take 5.72 weeks, at 1/10 gee 18.1 weeks, at 1/100 gee 57.2 weeks—and at 1/1000 gee 181 weeks, or 3 yrs & 25 wks.

I have added on the two illustrations at 1/1000 of one gravity boost because today (late 1979 as I write) we do not as yet know how to build constant-boost ships for long trips at 1 gee, 1/10 gee, or even 1/100 gee; Newton's Third Law of Motion (from which may be derived all the laws of rocketry) has us (temporarily) stumped. But only temporarily. There is $E = mc^2$, too, and there are several possible ways of "living off the country" like a foraging army for necessary reaction mass. Be patient; this is all very new. Most of you who read this will live to see constant-boost ships of 1/10 gee or better—and will be able to afford vacations in space—soon, soon! I probably won't live to see it, but *you* will. (No complaints, Sergeant—I was born in the horse & buggy age; I have lived to see men walk on the Moon and to see live pictures from the soil of Mars. I've had my share!)

But if you are willing to settle today for a constant-boost on the close order of magnitude of 1/1000 gee, we can start the project later this afternoon, as there are several known ways of building constant-boost jobs with that tiny acceleration—even light-sail ships.

I prefer to talk about light-sail ships (or, rather, ships that sail in the "Solar wind") because those last illustrations I added (1/1000 gee) show that we have the entire Solar System available to us *right now*; it is not necessary to wait for the year 2000 and new breakthroughs.

Ten weeks to Mars . . . a round trip to Pluto at 31.6 A.U. in 2 years and 9 months . . . or a round trip to Pluto's aphelion, the most remote spot we know of in the Solar System (other than the winter home of the comets).

Ten weeks—it took the Pilgrims in the *Mayflower* nine weeks and three days to cross the Atlantic.

Two years and nine months—that was a normal commercial voyage for a China clipper sailing out of Boston in the last century . . . and the canny Yankee merchants got rich on it.

Three years and twenty-five weeks is excessive for the China trade in the 19th century . . . but no one will ever take that long trip to Pluto *because Pluto does not reach aphelion until 2113* and by *then* we'll have ships that can get out there (constant boost with turnover near midpoint) *in three weeks.*

Please note that England, Holland, Spain, and Portugal all created worldwide empires with ships that took as long to get anywhere and back as would a 1/1000-gee spaceship. On the high seas or in space it is not distance that counts but *time.* The magnificent accomplishments of our astronauts up to now were made in free fall and are therefore analogous to floating down the Mississippi on a raft. But even the tiniest constant boost turns sailing the Solar System into a moneymaking commercial venture.

BOOK REVIEW

SHELLS AND SHOOTING, Willy Ley Modern Age Books, 160 pp., illustrations and diagrams ($2.00).

I once knew a man who could not afford to get married because he was the sole support of two cameras and five guns.

Later on he sold the cameras to buy another gun. Guns are like that. It is not necessary to be a hunter, not necessary to be in any wise bloodthirsty in order to be a gun crank. The true crank is much more interested in hitting an arbitrary mark on a paper target than in shooting at live things, for he wants to be able to measure his results —it is a mathematical passion. In fact it is not even necessary to shoot guns at all in order to be a gun crank. To be sure it is very pleasant indeed actually to fire guns, to hear them speak and feel the surging recoil. It is a sensuous pleasure, but not a vulgar one. The small-bore enthusiast seems as pleased at the pipsqueak *spat!* of his dainty toy as the gun captain of the sixteen-inch naval gun does at the virile, bass, deck-shivering *Wha—HOOM!* of his dinosaurian giant. The stubby fortyfive makes a *CRACK!* that hurts the eardrums; the Infantry's thirty-ought-three goes *Ka-POW!* and rolls the sound around the range; a machine gun chuckles like a demented sewing machine. Fine clean sounds, all of these, and inspiring a pure passion.

But not necessary to the devotee of the art. Mr. Ley does not own a gun. I doubt if he has fired one in years. Like the troubadour of other days it is not needful for him to lay a finger on his lady's hem for him to sing her praises.

Mr. Ley probably knows as much about the history and development of gunnery as any man alive and his treatment of modern weapons is authoritative and meticulously accurate. Portions of this book first appeared in the *United States Naval Institute Proceedings* and in the *Coast Artillery Journal.* These are scientific journals, for the professional, and Mr. Ley's work measures up in every way to their exacting standards—but the entire book is written with the sparkle, the good humor, the wit that regular readers of *Astounding* have long associated with Willy Ley's writings. It is a thoroughly delightful book.

"Shells and Shooting" might well be adopted as a first textbook in ordnance for student professionals. (I am informed that it has already received the official O. K. of Army Ordnance and of the censors as a

desirable book for the civilian to read.) About half of the book is concerned with the history of guns and with the ancient masters of the "Black Art"; the other half concerns contemporary weapons, their anatomy and tactical uses. I am not the sort of reviewer who synopsizes the work being reviewed in such a fashion that the reader need not bother to read the book itself. It is my intention to tempt you into laying two dollars on the line in order that Willy may get his cut in royalties.

Therefore, a *few hors d'oeuvres* and I'll call it day:

Sorry, but the Chinese did not invent guns. See Chapter I.

It has frequently been asserted that guns ended the age of the feudal knights because the armor of knights could not stop a musket ball. Sorry—but the guns of the time could not do more than dent armor, whereas a shaft from a longbow could penetrate. Nevertheless guns spelled *kaput* to knights in armor for an entirely different and purely economic reason. See Chapter I.

What is the highest above the surface of the earth ever reached by a manmade object? Stratosphere balloon? Sounding balloon? Rocket? Antiaircraft fire? No, the altitude record is still held by the German gun which shelled Paris in World War I—thirty miles. That may not seem far out in space to followers of the Gray Lensman, but it is hard vacuum out there. Thirty miles is more than twice as high as anything else ever reached.

Who built the biggest gun? And when? Where would you find an account of it? Last question first: In Gibbon's "Decline and Fall of the Roman Empire!" The gun was built by "Urban the Hungarian" for Sultan Mahomet II to be used in the siege of Constantinople. It fired a stone ball *one yard* thick. (Our biggest modern rifles fire a shell sixteen inches thick.)

I have saved the part that amused me the most 'till the last. Did it ever occur to you to wonder about "the rocket's red glare, the bombs bursting in air"? Does it not sound more like *this* war than the War of 1812? Signal rockets, you say? Sorry—Congreve's bombardment rockets, standard equipment in the British services for many years. The United States army adopted bombardment rockets shortly thereafter and continued to stock them until the Eighties. During the last century most major powers had rocket corps. Yet to the layman who does not read sciencefiction, a rocket is a Buck Rogers gadget, impossible and ridiculous. Yet the *war* rocket, the rocket as a weapon, is much older than the gun. You see—but never mind; you'll be reading about it in "Shells and Shooting." —R. A. Heinlein.

Agape and Eros: The Art of

Theodore Sturgeon

BY ROBERT A. HEINLEIN

GODBODY

"The Last of the Wine."

And the best.

Sometimes (not often) the last work of an artist, published after his death, is the capstone of his art, summing up what he had been telling the world all his life. In writing *Godbody* Theodore Sturgeon achieved this crowning statement. Again and again for half a century he has given us one message. In *Godbody* he tells us still again, and even more emphatically, the same timeless message that runs through all his writings and through all his living acts—a message that was ancient before he was born but which he made his own, then spoke it and sang it and shouted it and sometimes scolded us with it:

"Love one another."

Simple. Ancient. Difficult.

Seldom attained.

Early this century; before World War I, I was taught in Sunday school that Jesus loves us, you and me and everyone, saint and sinner alike. Then the Kaiser raped poor innocent Belgium, and never again did the world seem sweet and warm and safe. Today I cannot promise you that Jesus loves you, but I can assure you that Ted Sturgeon loves you ... did love you and does today—"does," present tense, because what I still hold of my childhood faith includes a conviction that Ted did not cease to be when his wornout body stopped breathing. It may be that villains die utterly. But not saints.

In fifty years of storytelling Sturgeon spoke to us of love, again and again and yet again, without ever repeating himself. One of the marks of his art was his unique talent for looking at an old situation from a new angle, one that no one else had ever noticed. He did not imitate (and could not be imitated) ... and each of his stories was a love story.

Examples:

"Bianca's Hands." (That one? A story so horrible that editors not only bounced it but blacklisted the author? Yes, that one.)

"The World Well Lost." (A love story, obviously—one about homosexuals. But please note that the copyright on it is 1953, many years before "gay pride" was even whispered, much less shouted. And Ted was not speaking in defense of himself but out of empathy for others. Ted was not even mildly homosexual. You can check this for yourself if you wish. I have no need to; I knew him intimately for more than forty years.)

"Some of Your Blood." (Go back and read it again. Yes, George Smith makes Count Dracula look like a tenderfoot Scout. But Sturgeon invites you to look at it from George Smith's angle.)

And so on, story after story for half a century. Some of Sturgeon's yarns had adventure trappings, or sciencefiction gadgets, or fantasy/ weird/ horror props, or whodunnit gimmicks or other McGuffins, but in each, tucked away or displayed openly, you will find some searching comment on love, a new statement, not something borrowed from another writer.

In addition to this prime interest Ted was alive to every facet of the world around him: He had a lifelong passion for machinery; his interest in music was intense and professional; he delighted in travel; he relished teaching others what he had learned—but above all and at all times, waking and sleeping, he loved his fellow humans and expressed it in all aspects of his life.

I first met Theodore Sturgeon in 1944. He had just returned from the Caribbean, where he had been a heavy-machinery operator building airstrips for the U.S. Army Air Force. That job played out in '44; no more airfields were being built in the Antilles; the emphasis was shifting to the Pacific Theater. Ted was 4-F, a waste of skin; his draft board laughed at him. He was not even eligible for limited service. Rheumatic fever in his highschool days had left him with a heart so disabled that simply staying alive through each day was a separate miracle.

That damaged heart not only kept Ted out of military service; ten years earlier it had robbed him of his dearest ambition: to be a circus acrobat. In high school, by grueling daily practice, he had transformed himself from that fabled ninety-pound weakling into a heavily muscled and highly skilled tumbler, one who could reasonably hope to join someday the "Greatest Show on Earth." Then one morning he woke up ill.

He recovered ... but with a badly damaged heart. A circus career was out of the question, and many other pursuits were foreclosed. Eventually his disability forced him into the one career open to anyone whose body is warm and mind still functioning: freelance writing.

I once collected notes for an essay—the relation between physical disability and the literary pursuit; or Shakespeare was 4-F and so was Lord Byron and Julius Caesar and Somerset Maugham—and what's your excuse, brother? Was it a queasy itch to see your name in print and a distaste for hard work? Or was it diabetes (polio, consumption, heart trouble) and a pressing need to pay the rent?

If we limit the discussion to science fiction, I can recall offhand several writers who got into the business not from choice but from physical disability coupled with financial necessity: Theodore Sturgeon, Robert A. Heinlein, Cleve Cartmill, H. G. Wells, Fletcher Pratt, Daniel F. Galouye, J. T. McIntosh. Each on this list wound up as a freelance writer through physical limitations that crowded him into it ... and I am sure that the list could be much longer, if we but knew.

So what was Sturgeon doing running bulldozers and backhoes and power shovels? Driving a Daisy Eight is not as easy as driving a car; rassling a dozer is no job for a man with a bad heart.

The answer is simple: Ted never paid any more attention to his physical limitations than he was forced to, and in wartime the physical examination for a civilian employee of the army or navy consisted of walking past the surgeon, who would then mark the prospect "fit for heavy manual labor." I am not joking. In World War II, I hired many civilians for the Navy Field Service; the Army Field Service was not more demanding than we were—or we would have snatched their prospects away from them. This was a time when any warm body would do. A typist was a girl who could tell a typewriter from a washing machine. (Later we took out the washing machine.)

So Ted built airstrips in broiling sun and 120-degree heat and failed to drop dead. He outlasted the job and then came to New York.

I think Ted worked for a while for the University of California, in the Empire State Building, with John W. Campbell, Jr., the editor of *Astounding Science Fiction,* as his supervisor. No, I have not jumped my trolley; at that time the University of California occupied one entire floor in the Empire State Building. Campbell was supervisor in a classified section that wrote radar operation and maintenance manuals —and even the word "radar" was classified; one did not say that word. (And didn't even *think* the word "uranium," not even in one's sleep.)

I am not certain what work Ted did, because in 1944 one did not poke into another man's classified work. I knew a trifle about this radar project because I had a radar project of my own, with a touch of overlap. But Campbell is dead now, and so is George O. Smith and so is Ted; I can't check. (Ted's wife Jayne can't be certain; I am speaking of the year she was born.)

As may be, Ted was writing at night for Campbell and sharing lodging with Jay Stanton, who was both Campbell's assistant supervisor on the radar writing project and Campbell's assistant editor at Street and Smith ... and all three men were part of another project I ran for OpNav-23, a brainstorming job on antikamikaze measures. (I was wearing three hats, not unusual then. One tended to live on aspirin and soothing syrup.)

I had been ordered to round up sciencefiction writers for this crash project—the wildest brains I could find, so Ted was a welcome recruit. Some of the others were George O. Smith, John W. Campbell, Jr., Murray Leinster, L. Ron Hubbard, Sprague de Camp, and Fletcher Pratt. On Saturday nights and Sundays this group usually gathered at my apartment in downtown Philadelphia.

At my request Campbell brought Sturgeon there. My first impression of Sturgeon was that no male had any business being that pretty. He was a golden boy, one that caused comparisons with Michelangelo's David. Or Baldur. He was twenty-six but looked about twenty. He was tall, straight, broadshouldered, and carried himself with the grace of a tightwire artist. He had a crown of golden curls, classic features and a sweet, permanent smile.

All this would have been inexcusable had it not been that he was honestly humble and warmly charming. When others spoke, Sturgeon listened with full attention. His interest in others caused one to forget his physical beauty.

My flat was about three hundred yards from the Broad Street Station; people came to these meetings from Washington, Scarsdale, Princeton, the Main Line, Manhattan, Arlington, etc.; my place was the most convenient rendezvous for most of the group. No one could drive a car (war restrictions), but the trains every thirty minutes on the Pennsylvania Railroad could get any member of the group there in two hours or less. It was a good neutral ground, too, for meetings that might include several officers (lieutenant to admiral), a corporal from OSS, a State Department officer, one sergeant, civil servants ranging from P-1 to P-6, contractors' employees with clearances up to "top secret" but limited by "need to know," and civilians with no official status and no clearance. I never worried about security because there was always one member of naval intelligence invariably present.

On Saturday nights there would be two or three in my bed, a couple on the couch and the rest on the livingroom floor. If there was still overflow, I sent them a block down the street to a friend with more floor space if not beds. Hotel rooms? Let's not be silly; this was 1944.

The first weekend Sturgeon was there he slept on the hall rug, a choice spot, while both L. Ron Hubbard and George O. Smith were in the overflow who had to walk down the street. In retrospect that seems like a wrong decision; Hubbard should not have been asked to walk, as both of his feet had been broken (drumhead-type injury) when his last ship was bombed. Ron had had a busy war—sunk four times and wounded again and again—and at that time was on limited duty at Princeton, attending military governors' school.

On Sunday afternoon the working meeting was over, and we were sitting around in my living room. Ron and Ted had been swapping stories and horrible puns and harmonizing on songs—both were fine vocalists, one baritone, one tenor. I think it was the first time they had met, and they obviously enjoyed each other's company.

Ron had run through a burlesque skit, playing all the parts; then Ted got up and made a speech "explaining" Marxism and featuring puns such as "Engels with dirty faces" (groan), and ending with "then comes the Revolution!" At that last word he jumped straight up into the air and into a full revolution—a back flip. His heels missed the ceiling by a scant inch, and he landed as perfectly as Mary Lou Retton on the exact spot on which he had been standing.

This with no warning—which is how I learned that Ted was a tumbler. This in a crowded room. This with no windup. I don't think he could have done it in a phone booth but he did not have much more room.

Ron Hubbard leaned toward me, said quietly into my ear, "Uh huh, I can see him now, a skinny kid in a clown suit too big for him, piling out of that little car with the other clowns and bouncing straight into his routine.

Ron was almost right.

I think it was a later weekend that we learned of Ted's incredible ability to produce just from his vocal cords, no props, any sound he had ever heard—traffic noises, train noises, shipboard noises, animals, birds, machinery, any accent whatever.

Here is the first one I asked for: A frosty morning, a buzzsaw powered by a two-cycle engine cranked by a line. Start the engine despite the freezing weather, then use the saw to cut firewood. The saw hits a nail in the wood.

I'm sorry I can't offer you a tape. Ted scored a cold four-oh.

Thirty-three years later, in front of a large audience at San Diego ComiCon, I asked Sturgeon to repeat that buzzsaw routine, defining it again for him, as he had forgotten ever doing it. He thought for a few seconds, then did it. Another four-oh.

The second one I demanded was this: A her lays an egg, then announces it. The farm wife shoos her off the nest long enough to grab the egg and replace it with a china egg.

Another perfect score—I do not know when or where Sturgeon coped with cranky two-cycle engines or with temperamental hens . . . but this farm boy now speaking can testify that Ted had been there in each case and could reproduce the sounds as exactly as any equipment from Sony or Mitsubishi.

I hope that someone somewhere has taped and preserved some of Sturgeon's jokes in dialect. I would like to hear again the one about the pub in London where one could get a bit of bread, a bit of cheese, a pint of bitter, a gammon of Yorkshire ham, a bit of pudding and a go with the barmaid, all for two and six. Try to imagine all *that.* Was anyone running a recorder?

Ted's ear was phenomenal and not limited to parlor tricks. Mark Twain said that the difference between the right word and almost the right word was the difference between lightning and a lightning bug.

Sturgeon did not deal in lightning bugs. *Exempli gratia:*

Godbody is written in multiple first person, a difficult narrative technique, believe me. Try this experiment. After you read *Godbody,* open it up anywhere, read three lines. Note the page number and write down who, in your opinion, is speaking. Do this several times.

Better yet, have someone help you, so that you do not know where the sample comes from—beginning, middle or end.

I predict that you will call correctly which of eight characters spoke each of these small samples.

Yet Sturgeon makes almost no use of spelled-out eccentricities of speech or other flags to mark his characters. Flagging is mechanical, a device any hack writer can copy. What Sturgeon does is subtle—each character has his own voice. How do you know at once who is calling on the telephone, if the caller is one familiar to you? By the caller's voice, of course.

How does Sturgeon do this? First let's dissect Paderewski's hands to learn how he played the piano; then we'll dissect Sturgeon's brain to learn how he could give an imaginary person his own unique voice. Art on this level resists analysis; the critic who tries it gets egg on his face.

Godbody—Forget about art and enjoy it. Some readers will feel that it is XXX-rated pornography. They will have plenty to go on.

Others will see it as a tender, gentle love story. They'll be right.

Many will find it offensively coarse in language (people of my generation, especially). It does contain every one of the "seven words that must never be used on television," plus four or five more that can't be used but never got on the verboten list.

Others will see that Ted has always used the exact word—always "lightning," never "lightning bug." Those four-letter shockers are essential.

Some will complain that *Godbody* is loaded with sex and violence.

Others may answer that "Hamlet" ("Romeo and Juliet," the Old Testament, *Le Morte d'Arthur)* is nothing but sex and violence.

Some will denounce *Godbody* as baldly sacrilegious. They'll be right.

Others will see it as tenderly and beautifully reverent. And they will be right.

Others will say, "Yes, it's a great story. But why did he have to stick so much nudity into it?"

I'll answer that one myself, since it is too late to ask Sturgeon. God must love skin since he makes so much of it. Covering it with cloth or leather or fur in the name of "decency" is a vice thought up by dirty old men; don't blame it on God.

Never mind what anyone says about this book. Read it, enjoy it, reread it, give it to someone you love. It is our last love letter from a man who loves all of us. Make the most of it today. Then keep it for a day when you are downhearted and need what it gives you.

And don't be afraid to love.

—R.A.H, September, 1985

THE WITCH’S DAUGHTERS

Have no truck with the
daughters of Lilith.
Pay no mind to the
redheaded creatures.
Man, be warned by their
sharp, white teeth;
Consider their skulls, and their
other queer features.

They’re not of our tribe, with their
flame-colored hair;
They’re no sib to us, with their
pale, white skins;
There’s no soul behind those
wild green eyes
Man, when you meet one-
walk widdershins!

When they die, they pop,
like burst soap bubble
(Eight hundred years
is their usual span).
Loving such beings
leads only to trouble.
By Heaven, be warned,
you rash young man!

August 1946

THE ROBERT HEINLEIN INTERVIEW

Conducted by J. Neil Schulman June 30, 1973

Note : This interview appears *exactly* as it was edited by Robert A. Heinlein in 1973, with no deletions, additions, or changes.—JNS, 1996

SCHULMAN: All right. Why don't we start with question number one?

HEINLEIN: Question number one: "Do you believe time travel is possible or is it merely a fictional device?"

There is no basis for belief or non-belief in this question, Neil. We don't have any data from which to work. There is at present no satisfactory theory of time. We haven't the slightest idea of how you might get your teeth into the fabric of time--whatever it is. Time travel, *as of now*, comes under the head of fantasy, inasmuch as it requires one to postulate something about which we know nothing. I *do not* regard time travel as either impossible or possible. I have no opinion about its possibility or impossibility because we have no data on which to make a judgment. But it makes an excellent device for telling stories, particularly stories that speculate about the condition of mankind and his future, and so forth and so on; it's been used almost entirely for that purpose, including *A Connecticut Yankee In KIng Arthur's Court* which is very largely a social and political pamphlet expressed in story form, to go back to a time-travel story of the last century and one which doesn't even use a time machine--it just postulates it. And the same thing is true, of course, of H.G. Wells' *Time Machine* and his *When The Sleeper Wakes*. In both cases he was using a time-travel device in order to permit him to speculate about the human condition.

SCHULMAN: If you *did* manage to find a time machine, would you go back and try strangling yourself as an infant to see if the universe would collapse around you?

HEINLEIN: No I wouldn't try it. [laughter] In the first place, I am not at all unhappy about having lived the life I've lived. In the second place, if I strangled the infant and the universe collapsed around me thereby--the solipsist's point of view--then I would have proved my point by *failing* to prove my point. I mean you wind up with a zero--with no *observer*, follow me? You wouldn't know if it worked or *not.* If you're going to engage in the notion that the universe ceases to exist if you die, then you're not entitled to an observer *outside* that to see what happens. Solipsism has its own logical paradoxes.

SCHULMAN: Okay. We might as well proceed to question number two, then.

HEINLEIN: "I'd like to know more about your theory that 'no matter how individualistic you feel, you are really only part of an evolutionary organism.'"

SCHULMAN: Did I quote you correctly on that?

HEINLEIN: You've placed a little emphasis in there: "really *only* a part of." What i believe I said--the book is across the room and I'm not going to dig it out--was that "you *are* part of an evolutionary organism" not "really *only* a part of." Difference in emphasis, do you follow me?

SCHULMAN: Yes.

HEINLEIN: Just as you are J. Neil Schulman and you are also part of the population of an area known as New York City. But it isn't a case of J. Neil Schulman being "really *only* a part of" New York City. You *are* J. Neil Schulman and you also happen to be one of that population group called by that name. Now, *there is* a matter of emphasis here. You say, "Can you prove this?" Well, I can't prove that you are "really *only* a part of" but I observe that you *are* only a part of. No emphasis on it, we simply observe it. You have parents. You have at least the potentiality of offspring. I assume that you go along more or less at least with evolutionary theory.

SCHULMAN: To a certain extent.

HEINLEIN: ...Yes. We simply observe that we are part of this continuing process.

SCHULMAN: Now, I think what I was asking here was the more philosophical question...in other words, I can see that I have parents and come from an evolutionary chain.

HEINLEIN: Yes.

SCHULMAN: But the phrase "evolutionary organism" seems to suggest that you have one being with central control or something...or at least some central *plan*.

HEINLEIN: It doesn't... I don't mean to imply that. Evolutionists differ in their notions as to whether or not there is any central plan or whether the whole matter is automatic, or what it may be. All I really meant is that although we feel as if we were discreet individuals, if you consider it in terms of four dimensions with time as the fourth dimension, you are part of a branch...a branching deal, with an actual physical connection going back into the past and physical connection extending into the future until such a time as it's chopped off. If you have no children then it's chopped off at that point. I have no children myself, however I'm not dead yet, either. I think, however, you are more interested in a later part here: "if so but we retain free will, why should we place the welfare of the whole organism above ourselves?" The question as to whether or not you place the welfare of your species--your race--above yourself is a matter for you to settle with yourself and for me to settle with me.

SCHULMAN: On what basis?

HEINLEIN: [Quoting question] "If you say it's something you can't justify on a purely rational basis, then what other basis is there to justify it?" That's what you're getting at; you're trying to make it as either/or here between rational and irrational.

SCHULMAN: Well...rational and *non*rational in any case.

HEINLEIN: All right. [Long pause] Uh, I'm trying to phrase this clearly. And you say this last question leads up to this next one: "Is there ever any justification to accept something on faith? How can you prove this since by doing so you are inherently rejecting reason as final arbiter?" Now, there are a lot of implications in your question, a lot oh hidden assumptions in your question.

SCHULMAN: I suppose so.

HEINLEIN: Yes, indeed. All the way through this I can see that you regard yourself as a rationalist and you regard reason as the final arbiter on anything.

SCHULMAN: Well, I'm basically starting out with Ayn Rand's Objectivist epistemology.

HEINLEIN: Well, I'm not going to comment on Miss Rand's epistemology; I have notions of my own. Have you read anything by Alfred Korzybski?

SCHULMAN: No, I'm familiar with his work only through your own; you've mentioned him quite a few times.

HEINLEIN: Only through my own. You haven't read *Science and Sanity*, for example?

SCHULMAN: No, I haven't.

HEINLEIN: And you're not familiar with his epistemological approach?

SCHULMAN: Only what you yourself have mentioned.

HEINLEIN: Uh, huh. [interruption] Uh, I've just been talking to Mrs. Heinlein; now let me see.

Let me invert these questions a bit. If you've read *Stranger in a Strange Land*, you've probably gathered what I think of faith. I do not regard faith as a basis on which to believe or disbelieve *anything*. On the other hand, Neil, there are many things--practically all of the important questions of philosophy--are not subject to final answers purely by reason. In my opinion, they are *not* subject to final answers simply by reason. This has been gone into a considerable extent by philosophers in the past, and there's even a term--a technical term--for that called "noumena" as opposed to "phenomena." Phenomena are things that you can grasp through your physical senses or through measurements made with your physical senses through instruments and so forth and so in other words, phenomena are things that we can know about the physical universe. Noumena translates as the *un*knowable things. The unknowable things: What is the purpose of the universe? Why are you here on this earth? What should a man do with his life? All of those wide open, generalized, unlimited "whys." There are all noumena, and consequently they are not subject--consequently *by definition*--these things are not subject to final answers simply by reason. My own attitude on that is shown a bit in several places in this last book [Time Enough For Love] in which Lazarus Long indicates that he hasn't been able to find any purpose to the universe any more significant than gametes using zygotes to create mare gametes. He expresses it that way in one place, then he turns it over, turns it upside down, and expresses it another way to the effect that as far as he knows, there's no more important purpose to the universe than making a baby with the help of a woman you love. And yet obviously neither of these things are answers; they are just expressions of what Lazarus Long happens to like. Now, do you happen to like chocolate malted milks?

SCHULMAN: Uh, yes.

HEINLEIN: Now, do you like them better than *strawberry* malted milks?

SCHULMAN: Yeah, I would say so.

HEINLEIN: Can you justify that by reason?

SCHULMAN: No, I would say that it's a purely subjective judgment.

HEINLEIN: That's right. That is correct. It doesn't involve faith and it doesn't involve reason.

SCHULMAN: But I'm using internal data; there *is* data which I am acting upon.

HEINLEIN: That's right. The internal data tells you that you like it better...but it doesn't tell you *why*. This applies also to a great many things about the universe: it's your own internal, subjective evaluation of it, not any final answers given by reason or rationality.

SCHULMAN: This brings up the end of *Methuselah's Children* in which Lazarus Long seems to be taking just about the opposite attitude.

I have a quote here:

"'The last two and a half centuries have just been my adolescence...men...never had enough time to tackle the important questions. Lots of capacity and not enough time to use it properly.'"

And then he's asked: "'How do you propose to tackle the important questions?'

"'How should I know? Ask me again in about five hundred years.'

"'You think that will make a difference?'

"'I do. Anyhow it'll give me time to poke around and pick up some interesting facts...'"

A little later: "'...Maybe there aren't any reasons.'

"'Yes, maybe it's just one colossal big joke with no point to it.' Lazarus stood up and scratched his ribs. 'But I can tell you this...here`s one monkey who's going to keep on climbing, and looking around him to see what he can see, as long as the tree holds out.'"

HEINLEIN: And that's exactly what he's doing at the end of the next book.

SCHULMAN: Just holding on.

HEINLEIN: Uh, yes. In the mean time it is postulated that he's had a couple of thousand years trying this, that, and the other thing, and he has reached *one* point. He has reached *one* opinion; it's stated flatly in the early part of the book: that you cannot get final answers about the universe from *inside*. He said you'd have to get outside and take a look at it. And the man he's talking to, Weatheral, says: "Then you believe in immortality?" [In the book, the word "afterlife" is used.] And Lazarus says, "Wait, wait, wait, wait, now--hold everything! I didn't say I believed in immortality; I don't *believe* in anything. Because belief gets in the way of *facts*." He's made certain observations and they've given him certain limited opinions, and among the limited opinions he has is the one working hypothesis that there *are no* final answers to be obtained from human being inside the universe, that the position of observation doesn't permit that--to get any final answers. Follow me?

SCHULMAN: Okay.

HEINLEIN: There's nothing inconsistent about the end of *Methuselah's Children* and what the man has to say a couple of thousand years later; it's just that he's had a couple of thousand years *trying* this that he said he was going to try and he still hasn't gotten any *final* answers.

SCHULMAN: I suppose this leads up to question number fifteen on page two.

HEINLEIN: Question fifteen on page two: "What would a 2,300 year old man know that we don't?" Neil, I haven't the slightest idea; I'm not even a hundred, yet! Remember, this thing's a work of *fiction*. "Wouldn't it take a 2,300 year old man to *write* the memoirs of Lazarus Long?" Of course it would, but do you know any? This is a work of fiction. If I've managed to make him at all convincing as an extremely old man--not necessarily twentythree centuries but extremely old--then it's successful as a work of art, as a work of fiction. If it entertains the reader in the course of doing that then it's a *commercially* successful work of art. But I am not twentythree hundred years old; I'm not even a century, yet.

SCHULMAN: I just wanted to check that out.

HEINLEIN: All right.

HEINLEIN: [Reading next part of question] "How did Shaw's *Back* *to Methuselah* influence this if at all?"

I read Shaw's *Back to Methuselah* about ten years before I started writing--oh, sometime in the thirties. I haven't looked at it since, don't remember it too clearly. I've read most of Shaw's plays and some of his essays and I suppose I've been influenced by him, just as I've been influenced by everything I've ever read, seen, tasted, felt, so forth and so on. But as for specific influence of one book on the other, they're rather different. As I recall, in the latter part of *Back to Methuselah* everyone has gotten extremely cautious because they`re afraid they might die. They've got so much to lose. Lazarus Long never suffers from that although I do indicate that some of the other Methuselahs or Howard people do have a bit of that trouble. But, I don't remember it too well; after all, I didn't see the play: I read it *once* something over forty years ago--or just about forty years ago--and I've never reread it since.

SCHULMAN: I think what I was referring to was a specific line that Richard Friedman, our *NLN* review editor [when this was taped], pointed out to me--something along the line that it would take long life to plan anything, that we simply don't have enough time to decide what the questions are to ask.

HEINLEIN: Oh, yes; I agree with that, and this also makes it difficult for me to pretend to be a twentythree century old man because, as I pointed out to you, I'm not even a century yet. I've noticed that you've paid quite a bit of attention to *Have Space Suit--Will Travel*. Do you recall in there, I think it's the Mother Thing appealing on behalf of the human race: "But my lord peers, they are all so very *young*." She's asking a certain amount of forbearance for the human race because it's so young. And that's about the situation we're in: our civilization is very young. None of us live long enough to cope with too much. About the time we begin to get our thoughts straightened out we begin to go senile. Or, in the mean time, we've been knocked over by a taxicab or died of the plague or something else. We *don't* live that long.

Shall we finish the rest of that same question?

SCHULMAN: Okay.

HEINLEIN: "Do you have any comments on the Wandering Jew legends which you've made reference to in several of your books?"

I don't recall the other references I've made to it but throughout my books I refer constantly to mythological matters, biblical matters, so forth and so on. Call these cultural ties, if you like. It comes under the head of putting a little flavor in the stew, that's all. The Wandering Jew legend, I really don't know anything about it. The *Encyclopedia Britannica* doesn't have much to say about it. It's apocryphal; there have been some good stories from it. General Lew Wallace's *The Prince* *of India*--which isn't nearly as well known as his book *Ben Hur* from which this movie was made--was based on the Wandering Jew legend and there have been several others. It's a nice, romantic legend that has considerable story value to it. You might say that I grabbed it and renamed him Lazarus Long and made this book out of it.

SCHULMAN: That's one of the first things I was thinking--that you might've been intending Lazarus Long to be the Wandering Jew--until he made reference to having met him.

HEINLEIN: As I recall--I seem to recall writing that paragraph--I don't think I specifically used it-- Sometime one does put something like that into a story in order the deny an assumption of that sort? I don't think I put it in for that purpose; I think it was just Lazarus Long enjoying one of his *whoppers* again. Lying in his teeth! [laughter]

SCHULMAN: Is there anything in the book he *believed*?

HEINLEIN: Oh, sure. If you examine the fashion in which it is written, the story of the adopted daughter is written cold sober all the way through.

SCHULMAN: That was, if I remember, third person?

HEINLEIN: No, it's both third person and first person, because part of it is narration recounting the events that take place on New Beginnings and part of it he's talking to the computer, Minerva. But he's being dead serious all the way through. But when he's simply engaged in conversation with other people...Mark Twain once said, "First research the facts. Then distort them to prove your case." [laughter] This character is sort of a Mark Twain character. I even have him come from Mark Twain's general part of the country. The Ozarks are noted for their whoppers.

SCHULMAN: Okay. What about the story of David Lamb?

HEINLEIN: David Lamb? What about him?

SCHULMAN: Well, is it based on anybody you know or material you drew from your own Annapolis experience or...?

HEINLEIN: You trying to get me sued? [laughter] This is why author's put disclaimers on the front of books.

SCHULMAN: Which is the biggest lie in any book.

HEINLEIN: Oh, sure. That character is fictional, but it is of course based on various things I knew, experienced, people I've known, when I was in the Navy. And obviously in telling the story Lazarus Long is having fun with it and not necessarily sticking closely to the truth. In fact, even in a casual reading of it, you can see big holes in it--where things don't fit, where the chronology is wrong--where the locations are wrong--all sorts of things.

SCHULMAN: I've only read it three times; I haven't had a chance to analyze it yet.

HEINLEIN: Well, for example, just casually on the side he locates the Naval Academy at West Point.

SCHULMAN: I'd thought that was just a failing of memory.

HEINLEIN: Probably. Possibly. Maybe. In any case, there are things like that through the story; it's not told *at all* in the dead serious way in which "The Tale of the Adopted Daughter" is told. Entirely different sort of story. It's partially a piece of satire. This man, no matter what he did, took the easiest way out, the laziest way out--and it always worked.

SCHULMAN: I can empathize with that.

HEINLEIN: [Laughing] Yes.

SCHULMAN: Would you like to go back to question number four?

HEINLEIN: Sure. Let me turn the pages here; oh, here we are. [Softly;] There's too much on this desk; there's *always* too much on this desk.

"About the space program. I know you are extremely impressed by the accomplishments of NASA. (Well, so am I.)" The accomplishment of NASA that I'm most impressed by is how they manage to take the most romantic subject I know of and by careful application make in incredibly *dull*. [Laughter] I am not disparaging the engineering accomplishments nor the heroic accomplishments of astronauts in saying that. I'm talking primarily about their P.R.O.! [Returning to question] "But since it was financed with tax money"--and your parenthetical remark in there ["(which I believe is the same thing as stolen money)"--JNS]--"isn't the expenditure of any more money by government on space program illegitimate?" Now the word "illegitimate" has a technical meaning, Neil: it means illegal. And the answer to that is that the expenditure is not illegal; it's perfectly legal--the laws are on the books. However, you used it in a philosophical sense. I *think* you used it equivalent to "immoral."

SCHULMAN: Well, you see, I equate legality with being based on natural law, and I see that statutory law is a nullification of that.

HEINLEIN: Well, now natural law--the concept of natural law --is one that many philosophers have tried to put over, but as far as I'm concerned natural law are things like the second law of thermodynamics--that entropy always increases--which could be defined mathematically. Natural law are the facts that we know about the physical world.

SCHULMAN: I believe that also in the "Notebooks [of Lazarus Long]" you have a statement that if you can't talk about it in math, it's not science, it's just opinion.

HEINLEIN: That is correct; if you can't talk about it *quantitatively* it is not science, it is just opinion. And on most of these matters of natural law, each philosopher that's attempted to do this has come up with a different set of natural laws from the one next door. Now, I don't know which philosopher you follow on this. Do I make myself clear?

SCHULMAN: Yes.

HEINLEIN: I should say at this point that my stories have consistently shown space travel being undertaken by private enterprise. That I regard as a matter of taste--my own taste. Which apparently agrees with yours.

SCHULMAN: Right.

HEINLEIN: [Continuing question] "Shouldn't the entire program be turned over to private enterprise to try and make a profit?" I don't like the expression "turned over." Shouldn't the entire program be "sold" to private enterprise?

SCHULMAN: Well, since from anarchistic point of view I don't see that government can legitimately own property...

HEINLEIN: All right; how can they *legitimately* pass on a title to it by "turning it over" to private enterprise?

SCHULMAN: I guess there's a philosophical contradiction in there...

HEINLEIN: Yes.

SCHULMAN: But if you accept the presence of government as an unwanted, already existing thing, you're always backed into corners like that. [This problem is soluble only by postulating a post-revolutionary situation in which anarchocapitalist arbitration agencies are liquidating all government properties and returning them to those victims with valid claims.]

HEINLEIN: Well, in any case..."For example, my colleague at *New Libertarian Notes*, Sam Konkin, says that if he were running the space program he's simply pay back his investment by running shiploads of moon rocks back to earth to sell as ornaments and jewelry." Well, I wonder if Mr. Konkin has considered the economic law of diminishing returns at that point?

SCHULMAN: I think he did take that into account; he had several other schemes like that...The point he was trying to make was that if somebody like him could figure out a way to bring back profits, sooner of later some sort of trade would be built out of this.

HEINLEIN: Oh, yes. I am quite certain that space travel is going to be enormously profitable in the long run. But that particular stunt...By the way, that is included in this enterprise of the Hubbards; I suppose you've heard about that?

SCHULMAN: L. Ron Hubbard?

HEINLEIN: No, no no. *Colonel* Hubbard, and his wife. Let me see. I'd like to find one of their magazines around here; I don't see one offhand and haven't time to look. In any case, they are trying to get together an organization to buy one of the remaining Apollos--to *buy from the government* one of the remaining Apollos--and start in on a *commercial* venture to get the human race out into the solar system and on out. They think it could be done by private enterprise and they're trying to do it. In other words, they have a point of view that is consonant with yours and consonant with mine.

SCHULMAN: We might as well bring in question number ten here, because it's related to number five.

HEINLEIN: All right; let me get to it. Number ten: "This question is related to number five. Have you heard the claims made by Dr. Andrew J. Galambos several years before the space program started that he could put a man on the moon for $100,000? If so, do you have any comments?" Who is Galambos?

SCHULMAN: Galambos is a Californian; he's at the Free Enterprise Institute which is in the Los Angeles area.

HEINLEIN: And what is the doctorate in--do you know?

SCHULMAN: I think it's in economics. [I was incorrect: Galambos's degree is in astrophysics.]

HEINLEIN: How far back did he make this remark?

SCHULMAN: Oh! I can't give anywhere near an exact date; I think it was as far back as the fifties that he was claiming that he had a plan to finance it.

HEINLEIN: Yes. Well, the fifties. I have to consider inflation as to what a hundred thousand dollars meant then and what a hundred thousand means now. Well, let's put it a few years back and figure that he'd be talking about a considerably more than a hundred thousand now; but if it's anything like that recent it wouldn't have more than doubled--the amount he's talking about--in buying power.

Now. I happen to be a quite experienced R and D engineer myself--not in space activities but in aircraft and in high altitudes work, things like that. Also, I built this house from which I'm talking to you right now--built it fairly recently. I spent considerably more than a hundred thousand dollars on it. I know *durn well* that I couldn't *begin* to build a spaceship--completely shut of all the difficulties of working through the government or anything like that; I mean if I simply had the cash and undertook to build it myself--I couldn't begin to build it for anything like a hundred thousand dollars. I do not think that Dr. Galambos is an experienced engineer of *any* sort.

SCHULMAN: I think the point he was trying to make is that if the government had allowed private research to be pursued in this instead of every time something was discovered clamping a top security on it that--

HEINLEIN: The government *did not* do that. On the contrary, everything that NASA puts is *open*.

SCHULMAN: *Everything*?

HEINLEIN: Everything. And they also put out a thing saying; now what subjects are you interested in? As a result of that, having noted several of the subjects that I was interested in, I have received so many, many pounds--so many millions of words--of research reports, that I finally had to move them up into my storehouse because I no longer had library space for them. Everything that NASA puts out, they do not have anything classified. *Nothing*. Now, let me distinguish between anything that the Air Force might be doing. The two activities are conducted separately: the Air Force does have classified espionage satellites, for example. But NASA does not, and they don't work the same places, they don't work together. Everything that NASA does--from the start by law--was to be open and unclassified and it *has* been. This is one of the things that I have cited--and that Arthur Clarke has cited--as being a payoff on the space program right now. Expensively as they've done it, nevertheless all that bread cast on the waters has already come back severalfold in the way of unclassified new technology that doesn't even have patents on it. You can get these things and you can use them all you please. I know that a lot of people are not aware of this but anyone in engineering that has any engineering interest is likely to be aware of it if he has taken the trouble to have himself placed on the mailing list.

SCHULMAN: Well, I guess that was just a mistake on *my* part. [Even more ironic is that Galambos is the father of the theory of primary property that states that *all* ideas are *pri*vate property and should be copyrighted.]

HEINLEIN: Yes. However, the thing that makes it so expensive when you do things through government is the *enormous* amount of bureaucracy and red tape. This is not alone, however, characteristic of government; it is characteristic of almost any big human organization. You get one of those really big corporations and you have a tremendous bureaucratic structure inside the corporation itself.

SCHULMAN: However, I've heard that because of competition demands, if you take the bureaucracy of a private corporation, it's maybe around *ten percent* of that which government manages to generate.

HEINLEIN: Well, I've seen a bit of both and I *don't* think the increase in efficiency on the part of free enterprise is that great. The justification for free enterprise is not that it's more efficient, *but that it's free*! Follow me?

SCHULMAN: Yes.

HEINLEIN: This reminds me of a story--oh, it's from a preface to a book about some civil liberties cases about forty years back; I wish I could remember the author; he was a prominent civil liberties lawyer. But he told this anecdote about down South, some time postbellum, but probably fifty or sixty or seventy years back, in which this

Southern gentleman was attempting to explain to the Yankee friend that the Negro had actually been better off under slavery. He says, "I'll prove it to you." He says, "Oh, Tom, Uncle; come over here." And this old Negro shuffled over. And he said to him, "Uncle, you were a slave, weren't you?"

"Yes, Cap'n."

"Tell me. Do you *eat* as well now as you did when you were a slave?"

"Oh, no, Cap'n. Sometimes pickin's might poor."

"Do you work as hard as you did when you were a slave?"

"Oh, no. I works *lots* harder *now*."

"Do you live in as good a house?"

"That little shack I'm in now, the rain comes in all the time."

He says, "Then you were better off when you were a slave, weren't you?"

And the old Negro *didn't* agree, he *didn't* say yes; he scratched his head and he said slowly, "Boss, there's somethin' about this heah freedom that I lahkes!"

SCHULMAN: [Laughing] Okay.

HEINLEIN: In other words, you don't have to justify private enterprise on the basis of its being more efficient than government--although it *usually* is. Not always, but usually.

SCHULMAN: Well, at least it keeps the bureaucracies running against each other so you have a bit of a choice.

HEINLEIN: Yes, and that's even possible inside the government--I'll tell you about a case in a moment. The justification for free enterprise is that it's *free*. "Sort of a looseness about this heah freedom that I lahkes!" That's all.

SCHULMAN: Okay. I don't need any further justification, myself, either.

HEINLEIN: It's a matter of taste. It's the way you feel about it, It's the way I feel about it. You don't have to prove it.

SCHULMAN: Okay.

HEINLEIN: Oh. Competition. I thought and still think that one of the mistakes that they made in this government was when they converted the Army and Navy into the Department of Defense and created the Air Force Department and simply incorporated it therein. You know what it did? It removed from a government system one of the few examples of healthy competition we see in government. The thing that kept the Navy on its toes was the Army, and the thing that kept the Army on its toes was the Navy, and the point at which they had to fight was right over the appropriations. And they weren't able--either one of them--to judge it for themselves: it was up to the Congress. And they had to *compete*. Now, all through the military service there are attempts to set up competition--oh, between ships, between companies, between squads, so forth and so on--because there are a hell of a lot of military officers--most of them perhaps--who realize that the competition which any socialistic set-up inherently lacks--and the Army and Navy *are* socialistic set-ups--is a shortcoming. It makes it less efficient. So they set up these artificial competitions just to keep them on their toes. There are plenty--Perhaps most professional military men are *acutely* aware that the Army and the Navy do not have it unless they deliberately build it up as a sort of a game.

SCHULMAN: I guess I could bring up the point in question number eleven on page two at this point.

HEINLEIN: All right. "In the 'Notebooks of Lazarus Long' there is a statement that since anarchists and pacifists refuse to support a state, they deserve no protection from that state. Wouldn't you say--at least about anarchists--that this statement is irrelevant because anarchists don't even *want* protection 'from' the state, they want protection *against* it?" Now. Neil. You have in there an assumption contrary to fact. And that is that there is such a thing as anarchists which agree on any one thing. [Laughter] There are as many sorts of anarchism as there are anarchists and you sure as hell know it by now!

SCHULMAN: [Laughing] Yes.

HEINLEIN: You've been in it a relatively short time--I mean by my time scale, not by Lazarus Long's--but you've certainly seen it. How do anarchists spend their time? Why they spend it fighting with *other* anarchists. Isn't that true?

SCHULMAN: [Still laughing] Well, a few of us manage to get along.

HEINLEIN: Well, you sent me first this *New Libertarian Notes* and I noticed that the lead article in there was one panning the hell out of the magazine called *Reason*. [Laughter] And blasting these *revisionists*, *dissidents*, and so forth. There are as many sorts of anarchists as there are anarchists.

SCHULMAN: Okay.

HEINLEIN: Incidentally, I'm delighted to have both magazines in the house as I frequently find something in each of them that disagrees with my own point of view. It does me no good to read something that *agrees* with my own point of view. I want to read something that disagrees with my own point of view, follow me?

SCHULMAN: Okay.

HEINLEIN: You can't learn from a man who agrees with you. But the point I wanted to bring out was that there are one hell of a lot of anarchists who think that there is pie in the sky and that Santa Claus sill lives and that somehow, some way, policemen will still be on the corner no matter if they do away with them. There are an awful lot of starry-eyed ignoramuses among anarchists, Neil--just as there are in any *other* political point of view. And there are plenty of them who *still* expect the government to protect them, and they really don't have imagination enough to visualize a completely lawless situation.

[Therein lies the value of libertarian science fiction--JNS]

SCHULMAN: In a recent book by Harry Browne called *How I Found Freedom In An Unfree World*--I don't know if you're familiar with it or not...

HEINLEIN: I've seen some reviews. I haven't read it. I've seen some reviews and things of it.

SCHULMAN: Well one of the things he brings out in there is the basic anarchocapitalist viewpoint--which he's bringing to the bestselling reading public for the first time--in which he's saying, "Well, suppose you didn't *have* police anymore--what would you do?" And he says, "Well, you'd probably lock your doors and stay out of unsafe neighborhoods and keep your children away from unsavory people--isn't that exactly what you're doing *now*?"

HEINLEIN: Yes.

SCHULMAN: And then he goes on to state the basic difference *we* have with government: that it provides relatively very little protection *at all*; if it does anything it simply provides a little retaliation to act as a deterrent--and it doesn't even do very much of *that*.

HEINLEIN: Well, we could get into a long discussion here of political and anarchist theory; all that I was getting at is that there are many anarchists who don't really get their teeth into that notion that there *could* be anything to be afraid of in an utterly lawless community. Now it is very much to the point to realize that the community is *already* quite lawless, as Harry Browne points out there. I'm one of those self-help people myself. Cop on the corner? I said I was fifteen miles out in the country; I'm fifteen miles from the nearest police service of any sort. It would take over half an hour for a sheriff's car to get here if he started right now. I mean if he were available and started right now. In other words we have no police protection. And, as you may have heard, Santa Cruz is noted as the murder capital of the world; it's a small town and we've had nineteen murders so far this year. Just a second. [pause] I had to shift position; my old bones were getting tired. Well, I believe in self-help. I'm quite a good shot. In fact I used to teach it. And my place is surrounded with a seven-foot-high steel fence topped with barbed wire and controlled by an electric gate....There are a number of people who can't seem to realize that things could be mighty rough--even rougher than they are *now*--if there wasn't the slightest bit of deterrence. I believe in deterrence, myself. I know quite well that there are a number of people walking the streets today alive and well only because there's a law with a certain *implied* punishment--even if it doesn't take place too often--for killing somebody. I'm not talking about anyone in particular either as the object or as the subject; I just say that I *know* that there are many times when somebody would *durn well* get killed if somebody else didn't feel that it was a *little* bit dangerous to go killing somebody. You might get arrested; you might get thrown in the hoosegow, and at least it would cause you dreadful inconvenience even if they didn't hang you.

SCHULMAN: Well, of course, I can agree with the idea of deterrence to a great extent, but I disagree with your premise that you need government to provide the deterrent. Of course my own view is based on the theories of Murray Rothbard and several other people here in the movement, about private protection agencies, and private armies, and settling disputes through private arbitration. Competing agencies.

HEINLEIN: Yes, I've read a good deal of this. I don't think that we can manage to settle matters of detail about political philosophy on the time and toll charges of the *Daily News*. So many things have been opened up at this point that you know quite well that it could go on for days and days and days and many thousands of words. I'm inclined to evaluate those things about private protection agencies and how protection could simply be left to the marketplace about equal to Karl Marx's notion that after the perfected socialism the state would wither away. You remember that was one of the predictions, that socialism led to anarchism through the state withering away. That was the happy condition of the future under Marx's predictions. Well, Marx turned out to be mistaken, at least so far as any evidence of the state withering away is concerned in the numerous countries that call themselves communist.

SCHULMAN: Well, I certainly don't think you had to run a trial run on it to find out; I think it was pretty evident from the inconsistencies in what he was saying.

HEINLEIN: Yes. And, no doubt, you have read a number of things criticizing this notion of leaving protection entirely to the marketplace, too. I would be delighted to see a circumstance under which we needed no laws, no protection, so forth and so on. None of the philosophers that I have encountered have been able to convince me that this is practical in the real world, that it could be done. It is much more likely that if we had, for a short time, a condition of anarchy, that shortly after there we weld have a condition of fascism that would grow up from a sort of vigilantism until finally a man on a horseback was in charge.

SCHULMAN: Well, you see there's where--of course you're right;

we don't have enough time to really get into this.

HEINLEIN: Yes.

SCHULMAN: The only question I'd want to ask is have you read, for instance, *The Market For Liberty* by the Tannehills, or *Precondition For Peace And Prosperity*: *Rational Anarchy* by Richard and Ernestine Perkins, or *For A New Liberty* by Dr. Rothbard? All three go into the theories in quite a bit of detail.

HEINLEIN: I have read a number of these things--not necessarily ones that you've mentioned--but I've been reading on this subject for considerably more than the past forty years. And no one of them has convinced me yet. What we *do* have on this globe in respect to nations is a condition of anarchy between nations, despite something that we laughingly call international law.

SCHULMAN: This is a point Dr. Rothbard makes frequently. He says we already have international anarchy; why not just decentralize down to the individual level?

HEINLEIN: Because along comes the bully boys. And if the bully boys band together then the people who simply want to be left along have to band together.

SCHULMAN: *Fine*. I'm not disagreeing with this.

HEINLEIN: Yes.

SCHULMAN: However, to use Franz Oppenheimer's definitions I would much rather provide my protection through the economic means, rather than the political means.

HEINLEIN: Well, I think that we had better chop this off.

SCHULMAN: Right.

HEINLEIN: Because it is too long; the *Daily News* can't *possibly* use it in depth. You've got twelve hundred words, something like that.

SCHULMAN: Fifteen hundred, it turns out.

HEINLEIN: Fifteen hundred. You couldn't possible discuss the theory of anarchism in that space.

SCHULMAN: Right. Well, hopefully, one of these days we'll be able to get it settled just between the two of us.

HEINLEIN: Well, I think we'll probably still be discussing it as long as both of us are alive. It isn't that I wouldn't like to *see* a condition of complete freedom; you saw me describe that in Happy Valley. And you also saw Lazarus Long cope with the bully boys. But he nevertheless suggested that Happy Valley was pretty highly selective to start with for several reasons. And that as long as they had a low population they could get along simply with the Golden Rule. And they were beginning--he indicates that as things got a little more complicated--they started having a little more in the way of rules. But even at that he was sill talking about an agrarian society with a very low population. But let's move on to other matters out of fairness to the *Daily News*.

I would say that my position is not too far from that of Ayn Rand's; that I would like to see government reduced to no more than internal police and courts, external armed forces--with the other matters handled otherwise. I'm sick of the way the government sticks its nose into *every*thing, now.

SCHULMAN: Okay. I think I'm going to have to turn over my tape right about now. Let's hold on for a second while I do so.

[AFTER THE TAPE IS TURNED]

SCHULMAN: Okay. How about question number five? [A number of questions relating to the Nixon Administration, impeachment, and relations with communist countries]

HEINLEIN: Let's leave that one alone.

SCHULMAN: Okay.

HEINLEIN: The reason I want to leave it alone is because like it or not the people you mentioned, at the present time, have tremendous responsibilities and I have no wish to jiggle their arms or second-guess them or be a Sunday-morning quarterback. It's *very* complicated and you don't have to like a man to know he's Officer of the Deck at the moment.

SCHULMAN: Okay.

HEINLEIN: Number seven would be next, if you want that one.

SCHULMAN: All right.

HEINLEIN: "Do you consider the revolution in *The Moon is a Harsh Mistress* to be a success?" I'm not sure what you mean by success; I described what happened and you can evaluate it to suit yourself. What happened in the long run appears in the *first* paragraph of the book and then again in the last paragraph. So far as Manny is concerned, the moon has acquired far too much government, they've thrown off the dictatorial rule from above and now they're getting far too much government from democratic means. It's not to his taste--nor to mine nor to yours. But I simply described what happened. I *might* say that there is implied there my own belief that government is an almost incurable disease of mankind when you get anything resembling a dense population.

SCHULMAN: And I think you also make a point in *Time Enough For Love*--I think Lazarus makes the statement--that any time you get a large enough population you have absolutely no privacy any more and it's time to move on.

HEINLEIN: In fact he defines it as when the population reaches the point where they require I.D.'s. Now, let me comment on that in my own case.

When I was born the population of the United States was seventy-five million. Take a look at it now. When I first went in the service, you didn't even have to have a birth certificate. I didn't get a birth certificate until I was nearly fifty years old--a so-called "delayed" birth certificate. We didn't have I,D.'s--I mean to say a member of the military forces did not carry an I.D. on his person--back when I started in. He simply didn't; there *weren't* any. Very much smaller population, very much smaller organization, so forth and so on. And now we've reached the point where every time I turn around somebody asks me for my social security number; I had it forced on me. Any time a place gets densely enough populated for things like this to happen, it's time to move on. *I've* moved on to what extent I can; I live out in the country. I've taken a look at all the rest of this globe and I can say this for the United States; it's the worst possible country on the globe *except for all the others*. And as for California, California has *tremendous* shortcomings; it simply happens to be better than the rest for my taste. *For my taste*. Alaska has a very small population but it has a horrible climate and I'm tired of shoveling snow.

SCHULMAN: My friend, Sam Konkin, is a bit of a Canadian chauvinist and he's always telling me about the glories of Alberta.

HEINLEIN: Oh, yes. He's perfectly right in that--if you're willing to put up with fifty degrees below zero; I'm *not.*

SCHULMAN: Okay.

HEINLEIN: I've done the best I can under the circumstances to get as much freedom as I can by self-help methods.

SCHULMAN: Okay. There's a second part to that question.

HEINLEIN: Okay.

SCHULMAN: And even a third.

HEINLEIN: Oh, yes. "One of our group of libertarians, David Friedman, believes that Prof locked out Manny and Wyoh from further conversation with Mike, then committed suicide to prevent Mike from using his powers as a dictatorial tyrant." Well, inasmuch as Prof died right on stage, suicide seems sort of unlikely to me. You remember how he died? He was *speaking* at the moment.

SCHULMAN: Right.

HEINLEIN: He's on a platform and speaking.

SCHULMAN: Of course, I *could* think of several ways it could be done.

HEINLEIN: Oh, yes, surely. So far as the author of the story is concerned, I never had any such theory in mind. David Friedman is mistaken about that. So far as I could, that story--told in the first person--was told as accurately as Manny could tell it. Of course his viewpoint is limited.

SCHULMAN: Okay.

HEINLEIN: "Is that what you intended? If not, what did you intend?" I intended to tell the story that the words set forth.

SCHULMAN: Okay, that's self explanatory.

HEINLEIN: And as for the revolution being a success, success is a word--used with respect to a revolution or any attempt of that sort--that involves a subjective judgment. It's clear from *Manny's* standpoint that it is something *less* than a success. The final result--the final outcome--is not entirely to his taste. He's thinking about moving on to where things are looser.

SCHULMAN: Okay. How about question number six, now?

HEINLEIN: "What would *Da Capo* have been like if you'd written it right after *Methuselah's Children*?" [Da Capo was the original title for *Time Enough For Love*--listed on the "Future History" chart--when Heinlein planned it back in the forties--JNS] Well in the first place I would have written it right after *Methuselah's Children*. So I'm reasonably certain that it would have been somewhat different from what it is, in fact *very* different. Look, I've lived more than a generation--in human terms--between those two books. It would be surprising if I hadn't changed some, grown some, changed my evaluations a bit in the course of that time, but in any case I did *not* write it then. And these *are* works of fiction.

SCHULMAN: Okay.

HEINLEIN: All right. "Do you believe, as some of my friends have claimed, that you 'copped out' by resolving the matters of the Jockaira gods only in conversation?" Look, I'm not dead, yet. What makes your friends think that I won't write that story?

SCHULMAN: They're hoping you will! In fact Sam Konkin--when I mentioned that I was still hoping you might write such a story--suggested that you should entitle it *Del Segno*, which means "from the sign."

HEINLEIN: Well, I used a musical analog all the way through this thing; it's Aria Da Capo and that's why the last part is "Da Capo." Aria Da Capo simply means to go back to the beginning...which he did.

SCHULMAN: Yes, he certainly did.

I have to say that I disagree with one point that you made in our last conversation; that pornography is literature written to create an erection, and that you didn't think that this was the case with the last part of *Time Enough For Love*. I can name at least three friends who read through that last part *with* an erection.

HEINLEIN: [Laughing] How old were they?

SCHULMAN: Right about my age.

HEINLEIN: Well, look--at the age of which you speak, almost everything makes you horny. The last part of that is certainly not pornography such as you can buy on Forty-Second Street. There *is* a great difference between realistic treatment of sex and pornographic treatment, and all I can say about that is that it was not *intended* to have that effect but if it did, my congratulations to you.

SCHULMAN: Okay. How about the next part of number six? ["What really happened at the Families' meeting of 2012?"]

HEINLEIN: The Families' meeting of 2012? Nobody knows what happened at the Families' meeting of 2012 but Lazarus and he ain't talkin'! The point is, if you take timing on the thing, this is the point at which the Families had to make a decision as to how they were to deal with what they could see was an upcoming dictatorship. Just consider the date involved on the thing. That ties in with the story--oh, something "Empire..."

SCHULMAN: "Logic of Empire"?

HEINLEIN: "Logic of Empire" and "If This Goes On--" and so forth. It was the date of a growing political crisis, and they're having to decide what they're going to do, and then there are indications later--in *Methuselah's Children* and elsewhere--that what they *did* do was go underground as thoroughly as they could, and distribute their wealth here and there under various and sundry dummies. Quite evidently Lazarus Long thought that their intentions were too mild--that they should do something far more dramatic--and 2,000 years later he is unwilling to argue the point as to whether his judgment was better or worse than of men long since dead. I don't particularly expect to do a story about the Families' meeting of 2012--all I have are some notes--and I'm not sure that it constitutes a story. Now. [Quoting from last part of question six] "I have to admit that my first thought when I started reading *Time Enough For Love* was shock and sadness to learn that Andy Libby had been dead over a thousand years." Well, if I write another story about Lazarus, it might turn out that Andy Libby *isn't* dead...at the time *that* story takes place.

SCHULMAN: Oooh!

HEINLEIN: You see, my stories jump around in time, they always *have*. They are not written in the sequence in which they appear on the time-chart that John Campbell published a long time ago, not at all in that sequence.

SCHULMAN: Speaking of the chart, there are two stories on there which are a bit of a mystery to quite a few of us; "Word Edgewise" and "Fire Down Below." [Two of the "Future History's" "unwritten" stories.]

HEINLEIN: I can indicate to you what each was about and they're--both of them--stories that I don't, at present, have plans for writing. I might; all I have are notes. But look, Neil--I probably don't have time to write too many more stories, and I have lots of other things I want to do besides writing stories. Like it or not I'm not going to last any twentythree centuries. "Fire Down Below" concerned a revolution in Antarctica and "Word Edgewise" concerned Zebediah Scudder [sic] taking over the United States through his church.

SCHULMAN: Wasn't that also "The Sound of His Wings"?

HEINLEIN: Well, there are two stories involved in there; both of them were intended to be novellas when I originally planned them many years ago. But I doubt if I will get around to writing these. I'd rather tackle something else. I have well over a hundred stories--with notes and outlines and so forth--in my files; most of them will never be written. I mean it's physically impossible simply for the reason that I acquire more stories each year than I write. I have more stories on file, unwritten, than I have written in my entire lifetime, and my backlog gets larger each year. So it has to be a matter of choosing the story that I happen to want to write.

SCHULMAN: Uh, huh.

HEINLEIN: And if I have that many stories left unwritten now, I will have *still more* stories left unwritten if I manage to last for a good many years longer, because it gets more so each year.

SCHULMAN: I think I can understand that because I find myself writing maybe one story for every thirty story-ideas I get.

HEINLEIN: That's right. All right. [Quoting last part of question six:] "I had expected the book to start telling about his and Lazarus`s trips exploring for real estate." I had rather expected that, too, except that I had to pick and choose what I would put into this story; you can't cover twentythree centuries in one book. Libby's and Lazarus Long's real estate adventures are not of the significance--I mean they're primarily adventures--they're not of the significance of the stuff that I *did* write, in my opinion. That book, despite its enormous bulk, is far more characterized by what I left out than by what I put in. [Chuckling] Twentythree centuries.

SCHULMAN: There's one thing that comes to mind that I didn't put on my list of questions, and that is I heard there was an entire section of *Stranger in a Strange Land* which was never used.

HEINLEIN: Oh, there are big chunks of *all* my stories that have never been used because I cut them to the bone as much as possible.

SCHULMAN: Specifically, I heard it was one telling Valentine Michael Smith's origins on Mars.

HEINLEIN: Oh, I've forgotten offhand just how much of that I cut out; I'd have to go back and look at my notes. I suppose somebody's been reading the archives down in the vaults at University of California?

SCHULMAN: Uh, or--Is there a library nearby you in Santa Cruz that has that?

HEINLEIN: University of California is my archivist and its nearest campus is just below me. They have a completist attitude and the very roughest of rough notes are saved just as carefully as the final drafts. Any story I'd finished with--at the time they set it up--I just turned everything over to them concerning that story.

SCHULMAN: I hope, one of these days, to get down there and start reading it.

HEINLEIN: Well, I don't think it's too edifying because if I hadn't thought the stuff I left in was better than the stuff I left out, I wouldn't have done it that way.

SCHULMAN: Okay, I can buy that.

HEINLEIN: However, people who are interested in such literary matters--which I'm not, especially--do dig into all these notes and correspondence and such. Now where are we?

SCHULMAN: Question number eight. ["Of all your stories, which one did you enjoy writing the most? Who is your favorite character?"]

HEINLEIN: All right. Oh, those at two very different things. When I gave the James Forrestal Memorial Lecture down there at the Naval Academy I answered specifically that first question. I enjoy writing them *all* because the thumb-rule that I have about fiction is whether of not it interests *me*. If it interests me then I assume that it probably will interest some other people. If it bores me I don't write it. Follow me?

SCHULMAN: Okay.

HEINLEIN: You know that's an impossible thing for me to answer? To begin with, *all* an author's characters are the author himself speaking in one way or another. He may even be speaking as the Devil's Advocate at one point, but nevertheless the author does it all. I *could* say Lazarus Long but that would simply be because it's the character that's been on my mind most recently. I could equally handily say Podkayne Fries, or Rhysling--it doesn't matter. I *can't* have a favorite character. It's as ridiculous--If an author has a favorite character, why he'll behave like a parent with a favorite child. Each one has to be my favorite when I'm writing about him.

SCHULMAN: Okay.

HEINLEIN: Or I don't do myself or the reader justice.

SCHULMAN: All right. Why don't we skip along to number nine, then? ["New Libertarian Notes Review Editor Richard Friedman created a fictional list of books that Dr. Samuel Russell (a character in *Have Space Suit Will Travel*, for them who don't know) gave to Kip to supplement his education. It was printed in *NLN* 5 (Summer Issue, 1971) and I'm enclosing a Xerox copy for you. Interestingly enough, one of the books is Eric Temple Bell's *Men of Mathematics*, which you recommended to me just yesterday. Do you have any comments or additions?"]

HEINLEIN: Let's see. I haven't had time to study that list; I know that about half of them were books I've read and about half were books I've not read but looked as if they might be appropriate. I haven't read *Have Space Suit Will Travel* for quite a long time; does Dr.

Russell give a specific list in there or not?

SCHULMAN: No.

HEINLEIN: He doesn't? Well, I really haven't had time to study Friedman's list and since I haven't read about half of them I don't know. It looks as though it were a pretty good list. In any case, if a man just reads and keeps on reading, whether he reads my favorites of not he's going to broaden his education. As long as he reads *everything*. That's why I was urging you to read Eric Temple Bell.

SCHULMAN: I've made a note to get my hands on both those books [Heinlein had also recommended Bell'`s *Queen of The Sciences*] plus John J. Pierce made a Xerox copy of part of his *Development of Mathematics* dealing with epistemology.

HEINLEIN: Well, that's good. I recommended Eric Temple Bell because he's so very readable. In that same connection John R. Pierce--John J. Pierce's father--is one of the best popular expositors--in addition to being a fine research man; one of the great physicists of our day--he's one of the best popular expositors, just as Eric Temple Bell was. Oh, look up stuff by John R. Pierce with popular titles; he can give you an appreciation of mathematical physics--or at least certain aspects of it--that you can't get from ordinary study. Dr. Pierce is a very, very clever writer. I commend his popular works to your attention--not his technical works because he works in an extremely technical field. But his popular exposition of what he does--and what Claude [E.] Shannon does, for example--the originator of information theory?--this is good. Dr. Pierce for the applications of mathematics to physics--are very good sources.

Now, let's see.

SCHULMAN: Well, we already went through ten and eleven.

HEINLEIN: Yes, all right now, twelve. "What is science fiction" [(I define it as the sort of stuff Robert Heinlein writes)]" Ah, yes. As you know, everybody takes a whack at that every now and then. Have you seen a book--just a moment, I'll catch the name; it's across the room here--[Long pause]--a book called *The Science Fiction Novel*, which contains four lectures--one by me, one by Alfred Bester, one by Cyril Kornbluth, and one by somebody else; I've forgotten who now--University of Chicago.

SCHULMAN: I've heard it referred to. I haven't seen it.

HEINLEIN: Well, the name of it's *The Science Fiction Novel* and it's Advent Press. I discuss the nature of science fiction quite extensively in the opening part of my lecture, and inasmuch as it's there and in print and you can unquestionably get it out of the library, I'll let it go with this one remark here: Science fiction is to my mind--if you want to separate it from fantasy--science fiction is based on the real world, speculation that takes place--usually into the future--about the real world, and which takes science as a necessary aspect of the story that you`re writing--meaning if you left the science out the story would fall to pieces. Fantasy, on the other hand, is a fairytale for grownups. It is not based on the real world. This is no criticism of fantasy; I'm not opposed to it at all. Tolkien's "Ring" trilogy, for example, is fantasy, laid in an unreal world about unreal things; that doesn't keep it from having philosophical importances to it that many students have seen. I write both science fiction *and* fantasy and I sometimes mix them up in the same story in a way that purists do not like. You have read *Glory Road*?

SCHULMAN: One of my favorites.

HEINLEIN: Well, that's both science fiction and fantasy all mixed up together.

SCHULMAN: I've been thinking for years that a story, for instance, like *Between Planets*--I could see it very easily shifted into an eighteenth or nineteenth century mode, you know, written by somebody like Robert Louis Stevenson, and instead of having Don Harvey being born between planets he could be born on a ship between countries...

HEINLEIN: Yes, yes. However, it was hardcore science fiction for its time because at the time I wrote that story it was still conceivable that Venus could be that sort of planet. That was written before we knew anything about Venus, or what we knew about it was the small amount that we could learn from the surface of this planet. I have written stories that are outright fantasies, such as "The Unpleasant Profession of Jonathan Hoag." Now you can't by any stretch of the imagination call that science fiction; there isn't any science in it and one simply goes along with the assumptions in it long enough to read the story. Or a story such as my short story--it was about city politics and a reporter and it involved a whirlwind that seemed to be setting it--I've forgotten the name of the story right now; it's in the same collection with "Jonathan Hoag"--that's a fantasy. ["Our Fair City" in *6 x H*--JNS] In fact, that entire collection with "Jonathan Hoag" are pretty much fantasies--"The Man Who Traveled In Elephants"; that's about all you can call that. All I can say about it is that I try to know which I'm doing when I'm doing it. There are a lot of people writing science fiction who don't know anything about science and they *think* they're writing science fiction when actually they're writing nonsense...[Quoting questions;] "Are any of your books *not* science fiction by your definition?" Yes, and you can pretty well pick them out in addition to the ones I've named. Well, "Magic Incorporated" is an example of one that is definitely fantasy, not science fiction.

SCHULMAN: But you would say that "Waldo" is science fiction?

HEINLEIN: It's closer to being fantasy but it has some science fiction aspects. As with *Glory Road*, I mixed the two elements into one story, which the purists don't care for, but sometime you can tell a good story that way. As far as I'm concerned, fiction is intended to entertain. If I can manage to entertain with it, that's what the cash customer is paying for. So I don't hesitate to write straight science fiction, straight fantasy, or a mixture of the two--or *anything* else. I've written all sorts of things. I've written first person, teenage *female* love stories laid in the present--not science fiction at all, but the sort of thing that I sold to girls' magazines, girls' teenage magazines--one magazine was called *Senior Prom*.

SCHULMAN: What name did you write under?

HEINLEIN: Now, that's a nasty question.

SCHULMAN: [Laughing] I'm really interested.

HEINLEIN: Look, those stories were written quite some time ago; their only importance was that they were sufficiently entertaining to be entertaining to teenage girls. I did it more or less experimentally because I had a female editor who said it couldn't be *done*. Whereupon I did it. Whereupon I finally thereafter started putting some female, teenage lead characters into my science fiction: "The Menace From Earth," for example; that's a piece of hardcore science fiction but the lead character is a fifteen, sixteen year old girl. Told in the first person, do you remember that story--"The Menace From Earth"?

SCHULMAN: Very, very well.

HEINLEIN: That was a direct result of having done those teenage love stories. And, eventually, I did *Podkayne of Mars* and there are two or three others kicking around here and there. I started using realistic female characters thereafter because I found it fleshed the stories out, it seemed to improve them.

SCHULMAN: Tell me, does the name "Lazabee Green" mean anything to you?

HEINLEIN: The name what?

SCHULMAN: Lazabee Green.

HEINLEIN: Spell it.

SCHULMAN: L-A-Z-A-B-E-E.

HEINLEIN: Lazadee?

SCHULMAN: Lazabee, with a "b" as in Betty.

HEINLEIN: Yes.

SCHULMAN: Green.

HEINLEIN: Greed

SCHULMAN: G-R-E-E-N.

HEINLEIN: Green. Lazabee Green. I don't believe I've ever read a story about such a character and I don't think I've known such person.

SCHULMAN: There was a rumor going around that this was one of your pen-names.

HEINLEIN: [Laughing] Oh. No, it's not. It doesn't mean anything to me at all. I can assure that this is *not* one of my pen-names.

SCHULMAN: Okay.

HEINLEIN: [Chuckling] A long time past I was accused of having the pen-name of L. Ron Hubbard, but that was many, many years ago.

SCHULMAN: [Laughing] It doesn't seem likely now.

HEINLEIN: Oh, it used to amuse Ron. We'd talk it over from time to time.

SCHULMAN: Okay. I guess we might as well move on to thirteen.

HEINLEIN: Question thirteen? Oh, but on twelve; "Do you prefer the term 'speculative' fiction? If so, why?" Yes, I prefer the term "speculative" fiction because there isn't anything about *that* term which ties me down to putting a lot of atomic physics or such into a story. It's a looser term. More elbow room. Speculative about the future. But serious speculation.

Now thirteen, ["About your future writing plans. Do you intend to write another juvenile? How about a story taking place (perhaps this wishful thinking on my part) in a working anarchocapitalist society with competing private police, arbitration, and armies?"] Future writing plans, we've already discussed that somewhat. If I continue to live and have a reasonable amount of health, I'll probably write some stories. I couldn't guess what they might be. For the past few years I've been ill as much as I've been well, so I haven't gotten very much done. As of right now I don't know what my next story will be.

SCHULMAN: Okay. I could tell you right off, though, that there are a lot of libertarian fans who would be quite happy to see you write something along the lines I described in number thirteen.

HEINLEIN: Well, I'll write it if it strikes me as a good story. I won't write it if not. If it's simply going to be a lecture, no. If I see a really good story in it, I would tackle it. I don't know; I've got things like that in the file. I did *something* like that in *Podkayne of Mars* when I took them to Venus. You remember that Venus had no government as such it simply had capitalists and employees and tourists.

SCHULMAN: Right, but there was only *one* company which I'm not sure is what normally would develop.

HEINLEIN: I'm not sure it is, either. But I say I did *something* like that once.

SCHULMAN: Okay.

HEINLEIN: L. Sprague De Camp did something like that with lots of companies; it was called "The Stolen Dormouse."

SCHULMAN: I'll have to look that up.

HEINLEIN: It's in a book of his--[Away from telephone;] (Yes, sweetheart.) It's in a--I can't remember what the title of the book was. I *should* remember; it was dedicated to me, but a good many years back. The title--Oh, *Divide and Rule* was the title of the volume, but I think it included "The Stolen Dormouse." It was in *Astounding* along about 1940, something like that. It described the United States under circumstances where everything was run by a bunch of *competing* corporations. It was quite amusing. Now, fourteen?

SCHULMAN: Fourteen.

HEINLEIN: "Do you believe that a 'romantic' story necessarily involves highly motivated characters striving--" Look, that's the sort of question you ask a professor of English! [Laughter] I'm not a literary person; I just write stories. They're intended to amuse people. I'm not sure what the difference is between a "romantic" story and some other sort of story, I've written stories that involved "highly motivated characters striving for a single, overpowering goal beset with obstacles and antagonists until the climatic resolution"--I have done that, yes. "Is this the story you like to read? Like to write? Used to like?" Look, I read *everything*. I'm a *garbage paper* reader. I'm the type of a person who sits on the curbstone and opens up paper wet from garbage to read the continuation of the jump page! I gave you my only thumb-rule for a story; if it interests *me*--if *I* find it interesting--I'll write it on the assumption that somebody else will be interested in it, too, but if it bores me I won't write it. But all of these other things, these are things that professors of English talk about in courses on literature and that's simply not the sort of education I had. If I had started worrying about things like that when I started writing I probably wouldn't have written even one story.

SCHULMAN: Okay.

HEINLEIN: Fifteen, we've had that, haven't we?

SCHULMAN: Right, and I think we've pretty much covered sixteen, too. [Question seventeen was irrelevant at this point.] I guess we're up to eighteen then.

HEINLEIN: "Do you see many of your recent story endings as downbeat? If so/not, why?" Well, I don't see them as downbeat. Do you? If so, which ones?

SCHULMAN: Well, I found *The Moon Is a Harsh Mistress* a bit depressing--from my point of view.

HEINLEIN: [Chuckling] Because the perfect anarchy wasn't set up as a result of it?

SCHULMAN: Right. [Also for a rather obvious reason which didn't come to mind; both my favorite characters--Mycroft and Prof--were dead (or presumed dead) at the end] Or because you seemed to feel government was an inevitable "disease."

HEINLEIN: I'm not sure that it's inevitable but I see nothing in the history of the human race to indicate to me that it is *not.*

SCHULMAN: You gotta start *somewhere*.

HEINLEIN: I'm not disagreeing with that, either. Let's see, the expression "necessary evil" was from Thomas Jefferson, wasn't it?

SCHULMAN: I don't know, specifically. [I have since learned that it's from the opening of Thomas Paine's "Common Sense."]

HEINLEIN: I think it was from Thomas Jefferson who was certainly a libertarian of his period. I never thought of *Harsh Mistress* as being downbeat. There are indications quite early in the story that they're *not* going to wind up with an anarchy, they simply *aren't*; you can see that from the fashion in which the committee starts to organize. I don't mean the revolutionary committee, but after they've taken over and they're trying to hold things together.

SCHULMAN: Several of your stories that have sort of dismissed the idea of finding a final resolution to philosophical problems on earth I find a little depressing because--

HEINLEIN: Oh, no! Well, yes, I can make some comment on that. Clear back in a thing called *Sixth Column*--which is a story that I wrote to a plot of John Campbell's and didn't particularly want to write, except that I needed the money--I added a lot of things into it that John Campbell didn't have in his plot including the idea that there *were* no final solutions. And Neil, there aren't.

SCHULMAN: Well, that won't prevent me from looking for them.

HEINLEIN: Yes, but don't be too discouraged when you don't find them. My wife--who is only a little younger than I am--still looks for these final answers, and is still hopeful. I got over looking for final solutions a good, long time ago because once you get this point shored up, something breaks out somewhere else. The human race gets along by the skin of its teeth, and it's been doing so for some hundreds of thousands or millions of years. Human solutions are *never* final solutions--at least so far as the history of the race up to now indicates. When I was a kid we had the "War to End All Wars"--going to make the world "safe for democracy." Now look at the damn thing. In fact, all you needed to do was take a little over ten years after that war as over and things were already in bad shape. We thought we had all the problems of our economy solved except the problems of distribution--I'm talking about the race as a whole, I'm not talking about my books--and now we suddenly discover that we're in a closed spaceship, a goldfish bowl, and if we don't get a balanced aquarium we're going to poison ourselves with our own poisons. It is the common human condition all through history that every time you solve a problem you discover that you've also created a *new* problem. I *did* a story based on this called *Beyond This Horizon*--

SCHULMAN: Which I'm just rereading, now.

HEINLEIN: All right. I started out with the assumption that *all* present-day problems had been solved at that point. I describe a utopia--largely anarchistic; there isn't enough government there to matter--and what do we do? We've got a hero who says: "Nevertheless, it ain't worth the trouble! What's it all about?" *He's* unhappy in this utopia simply because he doesn't have those answers to noumena--that I defined earlier?--the problems of philosophy known as noumena. And he finally accepts--agrees to accept--a partial answer: that a serious research effort will be undertaken--not to solve all those problems but simply to find out whether or not there is life after death, because that would--whether the answer is yes or whether the answer is no--it would affect the final answers on other things.

SCHULMAN: Do you have any opinions on that question?

HEINLEIN: I usually do not express them in newspapers.

SCHULMAN: Off the record?

HEINLEIN: I have little or no objective data. So far as *subjective* data is concerned, I *incline* to the notion that when we die, we don't die all over. That we do *not* die all over. That there is *something* that persists. But even that--because that opens up all of the questions of philosophy and religion--I avoid discussing in fiction endlessly, both in this last book and in *Stranger in a Strange Land* and *Beyond This Horizon* and lots of others.

SCHULMAN: I'll repeat the comment that I made in my letter; that I think religion and politics--or "philosophy" and politics--are the only subjects worth arguing about.

HEINLEIN: Well, yes. There are four major subjects as mentioned by Lazarus Long: war, money, politics, and love--and matters of philosophy affect all four of those. Those are four principal interests of the human animal. Sex, economic motivation, war, and politics. Politics in its broadest sense, which would include anarchy.

SCHULMAN: Right. Without meaning to get back on the subject of libertarianism again--because we *can't* go very far on that--I just wanted to make the comment that *Podkayne of Mars* there's a whole speech by Uncle Tom about not putting down politics because it's the way men get along without fighting.

HEINLEIN: Yes.

SCHULMAN: Well, we're in agreement about the idea of getting along without fighting, it's just that I--again using Franz Oppenheimer's definition--would call that the *economic* method, rather than the *political* method.

HEINLEIN: Well, politics simply names a field, that's all. Politics is the whole field of human interrelations. It is so difficult to separate the economic and the political factors that the subjects are often lumped in together as political economy--one title.

Now, let's see.

SCHULMAN: I guess we're up to nineteen or twenty; both are basically the same question. [Question nineteen, asking for an expansion of Heinlein's views on Ayn Rand, was dispensed with as having too low a priority for the *Sunday News*.]

HEINLEIN: Twenty: "What philosophers or artists--past or present--attract you, and why?"

SCHULMAN: That's a big question.

HEINLEIN: Well, yes it is...I studied philosophy under Will Durant many, many years ago--this was before he was well-known, *long* before he was well-known; this was back in the early twenties--and he first introduced me to a wide range of philosophers; and I read 'em all; I gobbled 'em all. I suppose I've learned something from all of them, but not necessarily what they wanted to impart. It took me quite a while, for example, to realize that what Plato was preaching was the direct opposite of what I liked and believed in--[Laughter]--because it was so well-told, so well-expressed. Artists?--are you speaking of pictorial art, or what?

SCHULMAN: I'm using art in the very general categories of music, painting, literature...

HEINLEIN: My tastes in art are pretty eclectic. I refer you to some remarks by Dr. Jubal Harshaw in *Stranger In a Strange Land* in which he discuses art and in which he indicates that most of the artists he likes are pre-World War One--and why. Now, this is not entirely true of myself--there are a lot of good artists around--but I'm reminded of something a Norwegian artist told me in Oslo a good many years ago. I asked him what he thought of American artists--did we have any good artists at the present time? and he said, "Oh, yes, yes--you've got lots of them. But they're all in *commercial* art. [Laughter] This is a period when a great many of the so-called fine artists are apparently painting with old brooms, and would be horrified at the idea that a picture actually had to *look* like something? Or say anything to the viewer? I'm an old square on that; I want to be able to understand a picture that I look at.

SCHULMAN: My father still has a color slide of three huge, white canvasses at the Museum of Modern Art with absolutely *nothing* on them.

HEINLEIN: Yes. Did your father like that?

SCHULMAN: He thought it was a big joke.

HEINLEIN: Yes, I think so, too. Like that pianist here some years back at one of these far out things who gave a concert that consisted of going to the piano and sitting there holding perfectly still for twelve minutes. Never touched the keys.

SCHULMAN: Yes, this was just done in Boston within the past two years.

HEINLEIN: Yes. That's carrying a joke a bit far; however, if they can get away with it, it's all right with me; I simply won't subscribe to it.

SCHULMAN: Well, you might pay for it once just for the gimmick, but I doubt that you'll ask for the recording.

HEINLEIN: Have you read *Huckleberry Finn*?

SCHULMAN: Not for a long time.

HEINLEIN: Well, do you remember that the Duke and the Dauphin arranged a show down in Arkansas that was a phony, a fake? And they put on three performances; the first, the people were dismayed; the second one, they had everybody else in town because the first people attending wouldn't admit they'd been swindled; and the third night, everybody showed up and they were carrying rotten eggs and dead cats and so forth. The Duke and the Dauphin snuck out the back door with the receipts and were half way to the river before Huck realized that they were about to go off without him! [Laughter] Mark Twain defined in there how many times you can get away with a swindle, and in that particular case three times--as long as you risk being lynched.

SCHULMAN: Okay.

HEINLEIN: Now. let's see. [Reading question twenty-one] "One of your main themes has constantly stressed that man is the most dangerous, deadly, and resourceful beast in the universe. Do you believe this? [If so, since we have no basis of comparison as yet, why?]"

Look, we aren't off this planet yet, really. I don't know whether he is or he isn't. Actually, what I'm saying at that point is he's the most dangerous, deadly, and resourceful beast on *this* planet, because that is all the universe we know so far. He certainly is on this planet--of course we've only been dominant for a relatively short time; the returns from upstate are not in yet--[Laughter]--but as of right ow, we are just that. I kept emphasizing that because there are so many people going around talking sweetness and light, acting as if the human animal--all you needed to do was make sure that you petted him enough when he's a small child and then he would never bite. I don't believe it. We got this way--we got where we are--over the course of a long stretch of evolution, by being survivor types in a very tough jungle. And from all I've seen of the human race so far, they're still that mean, tough, and nasty. I do not mean that as a derogatory remark, either; I think that's what it takes to survive. That doesn't mean you have to be mean, tough, and nasty in your daily behavior. In other words, I am not a pacifist, and I do not think the human animal is put together so he can be a pacifist and still survive. Pacifists stay alive at the present time because others who are not pacifists have put up with them and protect them in spite of themselves. There are some indications of that in *Time Enough For Love*, too. My ideal on that would be Dora in "The Tale of the Adopted Daughter" who's shown as utterly sweet and gentle all the way through except the one time when she was called upon to shoot and she shot. Did it right, and didn't hesitate.

SCHULMAN: I think I'm going to have to transfer cassettes at this point. One second.

HEINLEIN: All right.

[AFTER NEW CASSETTE IS PUT IN]

SCHULMAN: Okay, I guess we're up to number twentytwo, now.

HEINLEIN: All right. Hold it just a second. On twenty-one; One of the reasons I have emphasized that is because there have been lots of other writers who have always talked as if just as soon as we got in touch with really intelligent, highly advanced races, we will find them to be peaceful vegetarians. Well, I don't think that is necessarily true at all. There's no data on which to base that; it is simply wishful thinking on the part of the writers who write that way. The universe might turn out to be a hell of a sight nastier and tougher place than we have any reason to guess at this point. That first contact just *might* wipe out the human race, because we would encounter somebody who was meaner and tougher, and not at all inclined to be bothered by genocide. Be no more bothered by genocide than I am when I put out ant poison in the kitchen when the ants start swarming in.

SCHULMAN: Do you think any of the U.F.O's have been actual contacts?

HEINLEIN: I don't know. I simply don't have data.

SCHULMAN: What about Air Force Project *Bluebook*?

HEINLEIN: I don't have data. There have been some ooh-foh sightings that are extremely hard to explain. I'm reminded of something Willy Ley said to me, oh, twenty, twenty-five years ago. He said: "Vun. Dere is something dere. Two. I do not know vat it iss." I'm just about where Willy Ley put it then; there is something there and I do not know what it is.

SCHULMAN: Okay. [Question number twentytwo; "Alexei Panshin in *Heinlein In Dimension* claims that Clark Fries is 'thoroughly sick.' Since Clark happens to be one of my favorite characters, I believe Panshin is wrong, and that whatever Clark's problems, his natural intelligence will finally resolve them. What do you think?"]

HEINLEIN: Number twentytwo; I have not read *Heinlein in Dimension*; I've never seen it.

SCHULMAN: Okay.

HEINLEIN: Clark Fries--his *uncle* indicates in the very end of the story that he thinks the boy is sadly in need of treatment, yes. That's the uncle's opinion. And he also thinks the boy got into the shape that he's in through being neglected by his parents. That is the opinion of the uncle, however, I can see how Mr. Panshin would reach that opinion. You say that he happens to be one of your favorite characters. Well, he's one of *my* favorite characters, too. He was quite a lot of fun to write. Instead of writing the sweet, little Boy Scouts that I've done so many times, I wrote a character who was strictly self-centered. "And his natural intelligence will finally resolve"--yes, the last paragraph of the book indicates that Clark Fries had decided to join the human race. Yes, I would agree with you on that. He's *quite* young, you know, he's what?--twelve years old, something like that? And to expect much in the way of social integration out of a twelve-year-old is to be sadly disappointed.

SCHULMAN: Okay.

HEINLEIN: He's growing up, though. Yes. And he's quite intelligent.

[Number twentythree:] "Are you familiar with the psychological theories of Dr. Thomas Szasz?" I have in my study one of his books which I've read. Let me see the name of it here, if I can read it from across the room. The general idea was that he's opposed to psychiatry--although he's a professor or psychiatry--he's opposed to psychiatry as it's organized *now*. *The Myth of Mental Illness*, that's it.

SCHULMAN: The main point I was referring to here is his basic idea that you have to define mental illness--You just can't say that because someone commits an abhorrent act that he's "sick"; he says that the medical analogy just doesn't hold up.

HEINLEIN: That's right.

SCHULMAN: And you seemed to be making a similar point with the "sound semantic orientation" in "Coventry."

HEINLEIN: Yes, somewhat. Not the identical point, but a somewhat similar point. As far as I'm concerned the defense in court of "Not Guilty By Reason Of Insanity" should not be considered a defense at all. But, I'm not a psychiatrist.

SCHULMAN: I guess what I'm referring to next is the question: "If a person understands the consequences of 'damaging' another... [(namely, Rothbardian theory, full restitution to the victim plus cost of apprehension and interest for the time lost; or in the case of murder the murderer becomes the slave of the victim's heirs), isn't his psychological state irrelevant?"]

HEINLEIN: Look, that's a very complex question, particularly in that you want me to take a high order abstraction and follow that abstraction by somebody else's intensional definition, rather than an extensional definition.

SCHULMAN: I looked those up, and I'd like to be sure I understand them.

HEINLEIN: Extensional is where you define the word "chair" by pointing to a half a dozen or a dozen or twenty different chairs, and add; "and many others." That's an *extensional* definition. An extensional definition of human beings would be to go down and point to any busload and add; "and many others." Now an intensional definition is a definition you'll find in words in a dictionary. An intensional definition is where you define one symbol by means of other symbols. An extensional definition is where you define a symbol by its referrents. The referrent of the symbol. Korzybski, in lecturing, used to do away with any discussion of religion right at that point by inviting anyone in the audience to define the word "God"--G-o-d--and insisting that they define it *extensionally*, not define it in terms of other symbols. Try pointing at God.

SCHULMAN: Yes. Well, I remember when I was five years old--I was going home with my mother after we'd been out shopping, or something like that--and I asked her; "Where is God?" And since she was unable to tell me, from that point on I said, "Well gee. If she doesn't know where it is then how does she know there is one?"

HEINLEIN: Yes. Well, Korzybski's point was that since you can't point to the referrent for this symbol, we are not prepared to engage in any further discussion of it.

SCHULMAN: Was Korzybski trying to make the point that there was very little use for intensional definitions?

HEINLEIN: Well, there's a thing called the "Semantic Rosary" that he used to use--levels of abstraction. If you read this book *Science and Sanity*--or better yet, much easier to read is Dr. S.I. Hayakawa's *Language In Action*; the revised edition has slightly different wording but if you look that up you'd find the revised edition, too--This Hayakawa that I'm speaking of is the one that settled the riots at San Francisco State [College, not Prison].

SCHULMAN: I remember that.

HEINLEIN: He's quite a boy; mind you, this is a man older than *I* am who faced sown those rioters with his bare hands--and stopped the riots. He's not much older than I am, but he is a bit. I knew him first oh forty, yes forty, years ago.

SCHULMAN: I see reference to him in your 1941 Worldcon speech [Heinlein's Guest of Honor speech, "The Discovery of the Future"].

HEINLEIN: I referred to Hayakawa?

SCHULMAN: Mm, hmm.

HEINLEIN: Well, that's good, so that--He's been around for a while. He's no chicken. And his stuff is much easier to read than Korzybski's; Korzybski was a Pole, and I've never seen a Pole yet writing in English who didn't manage to get pretty turgid. Korzybski was a wonderful lecturer but his writing is rather difficult to follow, even though he is a s[S]emanticist. [Laughter] You can almost see him translating in his head. Hayakawa--despite his Japanese name--speaks English as a native language; he learned it as a baby in Canada, so that Hayakawa handles English much more easily than Korzybski ever did. I commend it your attention.

SCHULMAN: Okay.

HEINLEIN: But don't miss Korzybski before you're through. Korzybski is the fountainhead; Hayakawa is the follower.

SCHULMAN: In other words, Hayakawa brought Korzybski down to earth?

HEINLEIN: Somewhat like that. Certainly Hayakawa handles English in such a fashion that the layman can read it, whereas Korzybski is heavy going--quite technical.

Now where are we on this: Dr. Szasz..."damaging"..."isn't his psychological state irrelevant?" As I say, that involves so much in the way of high abstraction that I wouldn't attempt to answer it on my feet. [Quoting the last part of twentythree:] "Isn't "Coventry" still an attempt by the state (albeit a relatively benign one) to interfere with the natural market processes and not let the victim have his restitution?" Well, "Coventry" was an attempt on the part of a writer to make a few hundred dollars to pay off a mortgage. [Laughter] I got an idea for a quite different way of treating violations of law from the method of either hanging them or throwing them into jail. Simply divorce them, that's all. Expel them from society. And I still think it has its points although all I tried to make out of it was a novelette, and certainly there are lots of other things that can be said about it.

SCHULMAN: I specifically, however, remember "Coventry" as the first time which I pointed to a story and said, "Yeah, this is pretty much what I've been trying to say about the type of society I wanted to live in; and that's the story that--even though I didn't know the term at that point--I became a libertarian on.

HEINLEIN: Mm,hmmm. Number twenty-four next?

SCHULMAN: I guess so.

HEINLEIN: "Madalyn Murray O'Hair once told me that she's read everything you've ever written. [Any comments?]" I don't have any comment on that; I don't know the lady; I have never met her. I think I read an article--an interview--about her in the *Saturday Evening Post* about twenty years ago, and that's all. I really don't know very much about her. I'm pleased to hear she's read everything I've ever written; the more of those we have around, the more money I make.

SCHULMAN: I tend to think there are quite a few. I know at least twenty who can make that claim.

HEINLEIN: Well, inasmuch as I started in this business to make money and my purpose was to entertain, why this pleases me. I don't know Mrs. O'Hair--or "Ms." O'Hair, or whatever she calls herself--I really know nothing at all about her except that every now and then she takes part in a class action case and it always seems to be libertarian.

SCHULMAN: Okay.

I've managed to whip up a few more questions that aren't on the pages I've given you ; let's see if I can get a couple of them out of the way. John J. Pierce gave me a few questions which he wanted to know [and which I asked because I *also* was interested in them]...He wants me to ask you if you're aware that many who admire your work up to *The Moon Is a Harsh Mistress* or so are turned off by *I Will Fear No Evil* and *Time Enough For Love* and he's wondering if you think you've changed that much.

HEINLEIN: No, I do not. I knew that he was turned off by both of those books; he let me know...Probably John Jeremy would be considerably disappointed to know that *I Will Fear No Evil* was listed as a bestseller last year in a publishers' publication comparing the sales of the whole market; I think it would distress him. I got some bad reviews primarily inside science fiction itself; I got good reviews from outside science fiction and the book has been extremely successful with the public, whether it's popular with John Jeremy or not.

SCHULMAN: I think what he's trying to say --and I've gotten similar things from several other of my friends--is that they seem to feel that it's not as quite "hard core" science fiction.

HEINLEIN: Yes, yes. I have departed from the "true religion." [Laughter] Yes, I know. I remember a letter I received--oh, it must have been around 1947 for it was shortly after I had my first story published in the *Saturday Evening Post*; the story was "The Green Hills of Earth"--and it was from someone, a reader of *Astounding* chewing me out for departing from hardcore science fiction and also casting me into the outer darkness for going over into the slicks instead of staying with *Astounding*. I didn't even bother to answer the letter. The *Saturday Evening Post* was paying me something like ten times the word-rate that *Astounding* did; I couldn't *afford* to write for *Astounding* on that basis..I am happy to say that the public liked the book that he [J.J. Pierce] disliked so much, and I am also happy to say that I,m getting excellent reviews on this new book.

SCHULMAN: Did you read my review, yet?

HEINLEIN: I glanced through it rather hastily.

SCHULMAN: Was there anything you strongly disagreed with of anything I said?

HEINLEIN: No. No, I didn't. It seemed to me the review was quite fair. You did mention the difference in pacing--that's true. When you're writing an adventure story you *do* pace it differently from this sort of story, however there are adventure sequences in *Time Enough For Love* that *are* paced pretty fast--here and there--but it is not primarily an adventure story. In fact it's a whole bunch of stories, that's true. But how are you going to cope with twentythree centuries in one book?

SCHULMAN: With great difficulty?

HEINLEIN: [Laughing] Yes...Over the course of some thirty-four years of writing, every now and then I receive things from people condemning me for not having written a story just like my last one. I never pay any attention to this, Neil, because it has been my intention--my purpose--to make every story I've written different from every *other* story I've ever written--never to write a story just like my last one...I'm going to write what it suits me to write and if I write another story that's like any other story I've ever written, I'll be slipping.

SCHULMAN: I have a note up on my wall which I look at whenever I start getting down because somebody doesn't like a story I've written and it says something along the line of: "I'll write what I want to write, how I want to write, and for whatever reason I want to write it, and if anybody doesn't like it, he can go 'censored' for all I care."

HEINLEIN: Well, inasmuch as I have always written with the reader in mind, I agree with all of that but add onto it that I write for publication things that I think people will enjoy reading...and this book *I Will Fear No Evil* has been extremely successful with the general public, whether or not it appeals to a small group of science fictions fans...I'm trying to write to please not even as few as forty thousand people in the hardcover, but a million and up on the softcover. If an author let these self-appointed mentors decide for him what he's going to write and how he's going to write it, he'd never get anywhere...

SCHULMAN: It has been suggested to me that since I'm writing for a paper like the *Sunday News* I should do a sort of "movie-star"-type interview and ask you questions like "What are your hobbies? Do you have a garden?" That sort of thing.

HEINLEIN; Well, if you want to know things of that sort.

I used to alternate writing books with stonemasonry when I was in good health; I'm no longer physically up to that. But I've done a lot of stonemasonry and general mechanic work. I can do almost any of the construction trades. Of course I'm an engineer by training, but t I'm pretty handy with almost any tools. I can wire a house or set a toilet or almost anything of that sort--the sort of work with his hands that I described Lazarus Long as doing, these were things I know how to do. My wife is very much of a gardener, but I don't garden myself. At the present time what with frequent illnesses it's about all I can do to manage to keep up with the nonfiction that I have to keep up with to know what's going on. In consequence, I don't read very much fiction now--not because I don't want to but because I don't have time to. Reading science fiction back before I started writing it was my favorite way of spending leisure. But, Lordy, I don't have time to do it now. I do read a little of it, but not much. There are some very good writers around loose now whose work I have accumulated and hope to get to some time. Larry Niven, for example, is an example of a very good science fiction writer but I haven't read too much of his--I've simply got it accumulated in my room--just lack of time for I find Larry Niven *very* entertaining. Do you read him?

SCHULMAN: I haven't read anything of his, yet.

HEINLEIN: Well, I commend him to your attention. He's a very creative writer and very clever. He writes a good yarn.

My wife and I for many years have traveled as much as we could; this has been somewhat held down by illness in the past four or five years. I've been to South America a couple of times in the last four years but that's about as far away as I've been. But for a number of years I'd write a story while she prepared another trip and then we'd take the trip and I'd write a story while she prepared another trip and then we'd take the trip and I'd come back and write another story. I've never written more than about three months out of the year the whole time I've been writing. Part of that is because I never rewrite. I cut, but I don't rewrite.

SCHULMAN: I envy that. I rewrite [then, not now] everything I put my pen to at least ten times--not through desire, it's just through dissatisfaction.

HEINLEIN: Well, I never learned to do it that way. Far, far better to take it a little slower and write it the way you intend it to be and then I find I still have to take a brush-pen--and cut out unnecessary verbiage. Oh, I cut thirty or forty thousand words out of this last one, an I cut twenty-five, thirty thousand words out of what I thought was the final version of *Stranger in a Strange Land*. I mean I'd already cut it before that and then I cut out another twenty-five thousand words out of it to get it down to a manageable size.

SCHULMAN; One thing I was wondering about; were those "omitted's" in *Time Enough For Love* places where you actually cut, or was it just an insert at that point?

HEINLEIN: In some cases they were actual cuts; in other cases they're simply abrupt transitions to make it faster. An example of the abrupt transition is once when I decided that the reader had had plenty of the hardships of getting that covered wagon through the pass, and I just cut out the next several weeks. That's simply an abrupt transition, in other cases I cut it out because--after having written it--I cut it out because it wasn't absolutely necessary and the book was too damn big already.

For years and years we've traveled, oh, around the world three times, and I don't know how many times to Europe, over the North Pole, four or five times to South America. We've covered just about all the globe that we could reach, in view of the fact that you couldn't get a visa for Red China, and I did avoid the Congo after things got tough in there--just plain too difficult to travel. And usually Mrs. Heinlein has learned to speak at least one of the local languages and in some cases, I have, too. She can speak eight languages--I can get along in four--but she's not a professional linguist, she's a biochemist specializing in tropical and subtropical plants, genetics of them. But she happens to have an ear for languages and she studies very hard, so there's at least three languages that she can think in and some eight languages that she can get along it. But when she finished NYU a good many years ago she had only three languages; she simply kept adding them on.

We're both very fond of dancing; we haven't done much of it lately. We used to do a lot of dancing on ice. We belonged to a couple of figure skating clubs that regularly had ice dancing--social dancing on ice. I don't know whether you've ever seen it but all of the usual dances that are done on boards can be done on skates. And we belonged to a square dancing club and a cotillion and one thing or another, but we're always set up for dancing here in the house. But you get older...so we just don't dance as much as we used to.

SCHULMAN: Does your house resemble at all the description of Jubal Harshaw's place.

HEINLEIN: Well, of course I wrote that book when I was in Colorado--but not too much. Jubal Harshaw's house was tailored to Jubal; this house is tailored to us. It's an eccentric house in that it's as carefully tailored to use as a custom-made girdle. it's circular because Mrs. Heinlein wanted a circular house. I did the design work on it, but I did very largely what she wanted to accomplish. Got a big atrium in the middle of it--twelve feet across to the sky, open to the sky--which has a tree in it, and flowers. And it has all sorts of things that I put in to make housekeeping easier, for example everything is either built in or on wheels. One or the other. It's either built solid with the house or it's on wheels so it will roll, with the single exception of her baby grand. Putting a baby grand on wheels isn't too practical. Oh, and very complex wiring, and it's a forced-air factory system for ventilation and heating and so forth.

SCHULMAN: Are you a high-fidelity buff at all?

HEINLEIN: Not particularly. We do have a hi-fi system but I'm not the sort of a hi-fi buff who's continually worrying about components and, "Look at this curve" and , "now let's turn the gain up high and see what you can get there" and, you know, where their interest is in reproduction. Our interest is in the music. And we have an excellent sound system which a hi-fi buff would probably be playing with all the time and changing around. We simply got an expert to put the thing in an then we use it to play music. We have speakers distributed all around the house and outdoors--I don't know, fifteen, sixteen speakers--with switches and pads to let us get any combination we want. And the swimming pool is arranged the same way--I mean automated. Automatic cleaning, automatic chlorinization, and so forth.

SCHULMAN: I remember that--you just mentioned *Beyond This Horizon* a short time ago--in *Beyond This Horizon* is the first description I've ever seen of a waterbed. Do you have one of those?

HEINLEIN: I've got one but it's in the storehouse; I don't have any place to set it up. The first man to manufacture 'em sent us one as a compliment; he'd picked it up, not from *Beyond This Horizon*, but where I described it much more clearly in *Stranger in a Strange Land*. I designed the waterbed back in the thirties and couldn't afford to build the things. I wanted it then because I was an invalid. But I couldn't afford to build it and then finally used it in fiction, and a number of people picked it up from there and now *everybody's* building waterbeds. And some of them are built quite precisely to my specifications. I mean they really worked. Some of them are not so well-built. But I don't have space to set up a waterbed in this house without tearing something else out. And we do have some tailor made and quite comfortable beds.

The house has all sorts of things to make housekeeping simple because neither one of us cares too much for servants, and yet we've got a big enough place--and we're getting old enough--that we otherwise would need help. She has electronic cooking and, oh, little things. There are twelve or thirteen telephone jacks throughout the house, and eight or ten instruments so that no matter where we happen to be we can answer the phone there. And each of the bathrooms has a door to the outside so you can go directly from the bathroom to the pool without tracking wet and muddy feet through the house. A lot of things like that. It's an eccentric house, all right, but it's simply tailored to what we need to do.

SCHULMAN: I remember in *The Door Into Summer* you went through quite a bit about the drudgery of housework and one of the premises of the story had to do with all sorts of devices to make it easier. Have you come up with any of those things?

HEINLEIN: Most of the things I described in there are so far out that they would be extremely expensive to develop. That electronic equipment and so forth. It can be done, sure, but it would not be easy. I haven't attempted to put anything of that sort into *this* house because you can't buy it off the shelf and I'm not equipped to do--nor do I have any inclination to do--the tremendous amount of R and D work that would be involved.

SCHULMAN: Were Thorsen memory tubes purely a fictional creation?

HEINLEIN: Yes, however they've got things that are the equivalent to it right now, but I invented that notion back before they *did* have, when the state of computer art was much more primitive than it is now. I'm really surprised to see the extent to which they've managed to compress the memories in--oh, microminaturization in computers today is incredible to a person who's seen it grow up. I was first training in computers--in ballistics computers--back in 1930, when all the sequences had to be mechanical. When I see how far machine computation has gone since that time, I find it *the* most impressive development--more impressive than the atom bomb, more impressive than space travel--in its final consequences.

SCHULMAN: How far away do you think we are before somebody like Mike will be around?

HEINLEIN: You mean a human being who is raised by other beings?

SCHULMAN: No, I mean Mike in *The Moon is a Harsh Mistress*.

HEINLEIN: Oh!

SCHULMAN: Or is it the same character, as some people have claimed?

HEINLEIN: Uh, no. Simple coincidence. the names *derive* differently. One is from Mycroft and the other is from Michael. Combined with the fact that I have habitually used rather commonplace names for my lead characters on purpose.

SCHULMAN: I noticed at least four characters with the name "Smith"--or "Smythe" if you include--

HEINLEIN: Yes. Uh, huh. That's on purpose. If you don't use commonplace names then you invest a character with something unusual by his name. Now, Dr. Jubal Harshaw is an unusual name and there's a reason for it...there are overtones to the thing. Jonathan Hoag is an unusual name, and I spent a lot of time picking out that name. But ordinarily I use very commonplace names because I want the reader to identify, this is an everyman character.

SCHULMAN: But anyway, getting back to Mike in *The Moon is a Harsh Mistress*...

HEINLEIN: Now, that has an assumption in it that we don't know to be true and the assumption is discussed still farther in *Time Enough*

For Love. The assumption is that once a computer get sufficiently complex--on the order of complexity of the human brain--that awareness can take place, self awareness. Now, that's purely an assumption--I don't know whether it's true or not--but then nobody knows how human consciousness works, either. Herman Kahn was a guest of ours at the time I was writing *The Moon is a Harsh Mistress*. Do you know who I mean? The Hudson Institute?

SCHULMAN: Uh, no I don't.

HEINLEIN: *On Thermonuclear Warfare? Thinking About the Unthinkable? On Escalation*? Never heard of Herman Kahn?

SCHULMAN: I'm afraid I'm abysmally ignorant.

HEINLEIN: Well, he was with the Rand corporation, then he set up his own think-tank up the Hudson called the Hudson Institute. He is widely regarded as one of the top brains in the country. He was a physicist before he became an interdisciplinary man. I told him about this assumption and Herman thought about it and said, "Yes, that appears plausible." He made no further comment, because it's a matter on which no one can have a finished opinion until we see. This matter of artificial intelligence isn't very far along, yet--even the stuff they're doing at M.I.T.

SCHULMAN: Marvin Minsky and Seymour Pappert?

HEINLEIN: Yes, Marvin--you saw the article about Marvin in the *Wall Street Journal* about two weeks ago?

SCHULMAN: No, I didn't. The whole thing was pointed out to me by J.J. Pierce. [See "An interview With John J. Pierce," NLN 21, May, 1973 for this reference.]

HEINLEIN: Uh, huh. Marvin doesn't make any more claim than that himself. We were shipmate's here a short time ago--he and his daughter and my wife and myself--and we had a little discussion. There are some of us who think that machine intelligence is possible--machine self awareness--and some who do not, but the matter is wide open at the present time--nobody knows. Certainly Dr. Minsky has done pretty well in the line of teaching machines to do things. His machines *do* appear to reason. Remember and reason, but on a fairly primitive scale.

Let's see. This came about as the result of someone saying that you ought to do a movie star-type interview.

SCHULMAN: We seem to get back to the weighty stuff.

HEINLEIN: Well, let's see. I suppose that you have the usual biographical stuff on me that's been carried in several books several times?

SCHULMAN: I have all sorts of stuff. Alexei Panshin gives a brief account, there's a brief account in the *The Past Through Tomorrow*, I have a sheet which I Xerox[-copied] from a library book

[Contemporary American Authors]...Yeah I have several things.

HEINLEIN: I don't know what Panshin had to say because I've never read anything by Panshin. Panshin doesn't know very much about me, that's certain, I've never met him.

SCHULMAN: I don't know. I really think you may have missed something by not reading *Heinlein in Dimension*; I really found it a fascinating book.

HEINLEIN: Look, I don't ordinarily read reviews; my publisher does--he keeps track of them. I would read such a book if it were about Isaac Asimov, but although I know Isaac very well--close friend from a long time back--in reading about Isaac I would be reading about another person. Why the devil should I read about myself--what for?

SCHULMAN: Well, much of the material in the book is not specifically about you, it's about other concepts in science fiction and relating it to where he feels your contributions have been.

HEINLEIN: Well, okay. But still, why would I read it? I *wrote* it! [Laughter] I'm *certainly* not the market he aimed it at.

SCHULMAN: No, I guess not.

HEINLEIN: Yes.

SCHULMAN: One thing which I have a note on here—which doesn't relate to the movie-star interview part—is that there's a notion in several of your books—I'm specifically thinking of *Podkayne*—about Man's limitations in his own environment. You know, about how he can be sunstruck very easily, and needs arch-supports, and all sorts of things like that.

HEINLEIN: I didn't hear that latter part.

SCHULMAN: That he needs arch-supports for his feet.

HEINLEIN: Oh, yes.

SCHULMAN: Yes. And one of the notions that came to mind when you related to this how you thought that perhaps this wasn't man's natural environment was Desmond Morris's theory that the missing link in Man's evolution was a stage as an *aquatic* animal. I was wondering what you thought about that?

HEINLEIN: Well, it doesn't seem very likely to me, but it's not a matter to which I've given any deep thought. I haven't read what he has to say; it seems to me unlikely but I haven't read it. That's simply a very horseback opinion. It reminded me of something else...Have you read a book called *The Naked Ape*?

SCHULMAN: Yes, that's the one I was referring to. That's by Morris.

HEINLEIN: Oh! And that's the book you were referring to?

SCHULMAN: Yes. Desmond Morris's *The Naked Ape* and also *The Human Zoo*.

HEINLEIN: I had forgotten that portion in there about the possibility that he was aquatic--the Missing Link. The thing that impressed me about that book was his emphasis on pair-linking as an evolutionary necessity for the human animal. I was thinking about this matter...that all this discussion of sex and so forth is not appropriate to science fiction? Well, to my mind, sex is so central an element in every human being and in the development of the human race that to have left it out of science fiction--as it was for many years--was a major fault in science fiction, and I'm very pleased that it's now possible to write about it. I'm reminded of an elderly maiden aunt of a person of my generation--this was quite a while back--who remarked with respect to *Romeo and Juliet* that it was an excellent play, but why did he have to get all that sex stuff into it? Human sexuality is so major a factor in the human race that any attempt to deal with the human race or with people realistically which *omits* this factor cannot really be a mature treatment. And yet I know there are people who would be made uneasy in some fashion if sex gets into it, and yet sex has to be in it if we're to have human beings...

SCHULMAN: I'm getting near the end of the third side of my cassette; we've been going at it now for about three hours and your voice must be getting pretty tired.

HEINLEIN: Has it been that long? I suppose so. Let's see. As to other parts about me personally, you have some biog-notes there. You no doubt know that I was born in Missouri, I'm sure you know that I went to the Naval Academy and that I was disabled our of the Navy. I'm one of a large family. I have two older brothers--one of them is a general and one a professor--and one younger brother who is a professor, and three sisters. It's a very long-lived family. My mother is still living at ninety-four...And [my grandfather taught] me to play chess when I was four years old and we used to play.

SCHULMAN: Do you still play?

HEINLEIN: I haven't time. I haven't time. Chess and contract bridge are both very entertaining and they are both compelling time-takers. I've given up both of them because they take up so much time. And, essentially there's nothing to either one of them--I mean after you're through where have you been? Like the boy who rode the merry-go-round. I just haven't time; there's too much to do. No, I expect to take up both of them again when I *do* finally retire--if I ever do.

SCHULMAN: I didn't know that writers *did* retire.

HEINLEIN: Well, Tony Boucher pointed that out to me years ago. he said that there are retired everything else--retired schoolteachers, retired firemen, retired bankers--but there are no retired writers. There are simply writers who are no longer selling.

SCHULMAN: I assume that you say, "Dammit, I'm going to retire" and then two hours later you say, "Hey--I just got the greatest idea for a story!"

HEINLEIN: Oh, yes. It's addictive. I didn't intend to stay in the writing business more than a couple of years.

SCHULMAN: There's a statement made to that effect in your forty-one Worldcon speech; you said that you'd probably be doing something along the line of defense work.

HEINLEIN: Well, yes...

[Break in transcription as cassette ended. Question asked before I realized it wasn't going dealt with whether he thought events of today were indicative of a "future shock" similar to the "semantic disorientation" of the Crazy Years in the "Future History" series--JNS]

SCHULMAN: Okay. I think we're going again.

HEINLEIN: [Responding in the affirmative] A very easy example is right there in Manhattan. Back in 1930 I had a studio down in Greenwich Village and I never hesitated to be out at night any place in Manhattan. Now when I go to Manhattan I am very, very careful. The situation has changed. Even though that was during Prohibition--the so-called gangster era--the streets were far safer then than they are now. Mugging didn't even exist as a word in 1930. That's one illustration.

SCHULMAN: And certainly the word "gay" has changed in meaning considerably.

HEINLEIN: Well, it has changed in the public meaning. "Gay" had its idiomatic meaning in respect to homosexuality--"among the gay"--as far back as 1930. I know, for of course Greenwich Village even then had quite a lot of it, both men and women. But "gay"--now the general public knows what it means. I mean the idiomatic meaning has pushed the normal meaning aside. If you read over the headlines that I put into the *Crazy Years* in *Methuselah's Children*, some of them don't even look odd.

SCHULMAN: No, they don't.

HEINLEIN: They're not startling. But they *were* startling when I wrote them.

SCHULMAN: Although nobody's talking about raising the voting age to forty-one.

HEINLEIN: No, but they did the reverse of that; they lowered it to eighteen, and they removed all possible impediments. I mean, all you have to be is a warm body now. For example at the present time, the student body down here at the University of California at Santa Cruz is eligible to vote in the city election--any of them who care to register for it--by the current rulings. This means the student body can outvote the city itself on things like bond elections. On the real property. And yet those kids down there are transients. They're not permanent residents, they're simply there to go to school.

SCHULMAN: I never *did* think voting was a very good way to settle issues.

HEINLEIN: I don't either, and neither does Lazarus Long, as I indicated in there. But the things that they've done about voting are the reverse of what I had in there about raising the voting age to forty. It would have fitted more if I had made it "lowered the voting age to twelve."

SCHULMAN: Well there was a movie about that just a short time ago.

HEINLEIN: Yes, I know. I didn't see the movie but I read an account of it. I know that there was such.

SCHULMAN: *Wild in the Streets*.

HEINLEIN: Yes, *Wild in the Streets*, and they were liquidating people who were over something or other.

SCHULMAN: I think it was thirty.

HEINLEIN: Something like that.

SCHULMAN: Taking them off to prison camps.

HEINLEIN: Yes. I remember the *Wall Street Journal* ran a three line notice--sad note or obituary, or something like that; this was four or five years ago--noting that the man who originated the slogan, "Never trust anyone over thirty"!

SCHULMAN: Yes?

HEINLEIN: Had just had his thirtieth birthday. [Laughter] This was four or five years back.

SCHULMAN: Tell me, what do you mean by a "mature society"? You used the words differently on the "Future History" chart and in *Time Enough For Love*. Like on the "Future History" chart you refer to the semantically oriented society as a "mature" society. End of human adolescence.

HEINLEIN: And in *Time Enough For Love*?

SCHULMAN: There's a sentence to the effect that in a "mature society" civil servant is semantically equivalent to civil *master*.

HEINLEIN: Yes. Well, you can attribute that to the fact that in the course of thirty years, I became some what pessimistic about political solutions. Yes, I did use the word differently. At the time I wrote *Methuselah's Children* I was still politically quite naive and still had hopes that various libertarian notions could be put over by political processes....It [now] seems to me that every time we manage to establish one freedom, they take another one away. Maybe two. And that seems to me characteristic of a society as it gets older and more crowded and higher taxes and more laws. One thing that I stuck in *Time enough For Love* on purpose without calling attention to it had this twelve-year-old boy driving a car in Kansas City? And Lazarus thought it was all right and legal at that time in Kansas City. My next older brother drove a car regularly--every day--when he was twelve years old in Kansas City. There were neither driving examinations nor driving licenses. Nor very much traffic.

SCHULMAN: I don't know. I'm sort of hoping that one of these days we'll get the best of both worlds, the high technology that we benefit so much by--which we need a fairly large population for--and the libertarian society which I'm working for.

HEINLEIN: The question of how many mega-men it takes to maintain a high-technology society and how many mega-men it takes to produce oppressions simply through the complexity of the society is a matter that I have never satisfactorily solved in my own mind. but I am quite sure that one works against the other, that it takes a large-ish population for a high technology, but if you get large populations human liberties are *automatically* restricted even if you don't have legislation about it. In fact, the legislation in many cases is intended to--and sometimes does--lubricate the frictions that take place between people simply because they're too close together.

SCHULMAN: I'm sort of thinking the solution might come *through* technology, if we ever get to the point where you have some sort of, let's say, portable force-field which can physically prevent a person from being harmed by somebody else.

HEINLEIN: Have you read *The Caves of Steel* and *The Naked Sun* by Dr. Asimov?

SCHULMAN: No, I haven't.

HEINLEIN: I think they're in hardcover and in the library. One shows a highly libertarian society and the other one shows Manhattan even more crowded that it is now. And Isaac deals with each of them--somewhat different in point of view from you or from me--because Isaac actually *likes* big cities.

SCHULMAN: Well, so do I. One of my favorite lines in all your writings is the description of New Chicago in *Between Planets* with its decadence--"rotten at the core and skidding toward the pit"--that's just the type of place I like. I guess I--like Dr. Jefferson--"infest" New York.

HEINLEIN: You would find both those Asimov books interesting particularly if you read them practically side by side. There's the same historical background and one concerns an extremely *loose* population and the other one concerns and extremely *tight* population and how they deal with it. Isaac's stuff is *always* stimulating even when you don't agree with it. Perhaps even most so when you disagree with it.

Well, unless you have something else specifically to ask me, I think we'd better simply adjourn.

SCHULMAN: Well, I just have one more question...Do you expect a "false dawn" and eclipse in astronautics?

HEINLEIN: Oh, hell. [Laughter] That *whole* chart is fictional. The stuff isn't history, it's *fiction*. Anybody who would attempt to make a firm prediction about that with the amount of data at hand would be reckless, to say the least. There doesn't seem to be any great enthusiasm for space travel at the present time in this country but I'm reasonably certain that the human race will continue with it in the near future. Whether or not they'll do it in English, or in Russian, or in Chinese, I couldn't guess. But I don't think we've dropped the matter.

SCHULMAN: If you really ever get interested in the Prophet again, I'm still waiting to find out about him. He interests me.

HEINLEIN: What--Nehemiah Scudder?

SCHULMAN: Yes.

HEINLEIN: Oh, I might some day. I don't know.

SCHULMAN: He's the one character you've created that we've never met, yet.

HEINLEIN: That was intentional. One of the things I had in mind was to do a story in which the lead character would never come on stage. What you would feel is his influence. And I think I did.

SCHULMAN: Well, I guess I've sort of talked myself out. At least for now...[Deletion of some technical conversation]

HEINLEIN: Well, I'll talk further if you want to at another time.

SCHULMAN: Thank you very, very much Mr. Heinlein.

HEINLEIN: I look forward to hearing from you again. Goodbye.

SCHULMAN: Bye, bye.

Channel Markers

Editor's Note: On April 5, 1973, Robert A. Heinlein' delivered the James Forrestal Memorial Lecture to the Brigade of Midshipmen at his alma mater, the U.S. Naval Academy at Annapolis. While every sciencefiction reader knows Heinlein through his stories, where his characters often speak from many different points of view, here he speaks in his own person, about writing, about science fiction, and about the things in life that he considers to be most important.

Introduction by the Midshipman "Six-Striper" . . . a speaker who is not "A Stranger in a Strange Land."

Mr. Heinlein: Thank you, Brigade Commander—and "It's Great to Be Back," too!

Admiral and Mrs. Mack, Ladies and Gentlemen, Young Gentlemen of the Brigade

For years I have refused all requests to speak . . . but when I was asked to speak at my alma mater I accepted at once—and caught myself in a bight, for I learned that I was expected to talk about science fiction, its impact on American society, and my experiences concerning it.

But I never discuss my stories and I am still more reluctant to discuss the work of my colleagues. As for the impact of speculative fiction, I am too close to the center to judge. And how can an author have experiences in connection with his work? He works alone, no company but a typewriter. About all that could happen to him would be an earthquake.

Let's see if the subject is something you want to hear about—How many of you ever read science fiction? Hands, please.

All right, I'll talk about science fiction . . . but I'll get in a few licks at the end on what *I* want to talk about.

Now who of you here tonight has read anything that I have written? Hands up again, please.

Thank you.

One more datum, please— How many of you are interested in writing for publication? May I see hands again?

Oh, come now, you're not being frank with me. Thousands of contacts with the public over more than thirty years cause me to estimate the number of aspirant writers among the adults of this country at fifty percent—or more. It is impossible that a group this large, all adult and all literate, could have so few in it who want to write. I can tell you in less than fifty words how to get published . . . but if you are too shy to admit that you are interested in writing and publishing what you write, I won't bother.

Let's try again. How many are interested in writing for publication? I won't talk if only a handful want to hear. Let's see hands.

All right, that's enough to justify discussing it. The rest of you are invited to dope off and think about the gatefold in *Playboy.*

Five Rules for Success in Writing:

First: You must *write.*

Second: You must *finish* what you write.

Third: You must refrain from rewriting except to editorial order.

Fourth: You must place it on the market.

Fifth: You must *keep* it on the market until sold.

That's all. That's a surefire formula for getting anything—anything at all!—published. But so seldom does anyone follow all five rules that the profession of writing is a soft touch for those who do—even though most professional writers are not too bright, not too wise, not too creative. For these rules work in series, not in parallel. If you bilge any one of them, you bilge completely—and your writing will not be published.

Let's see how they work. I said that half of the adult, literate population claim to want to write. Call that half of a hundred million. So we start with fifty million people.

Nine out of ten who *say* they want to write never get around to it. That leaves five million.

Not more than one in ten who start to write something ever finish what they start—finish it completely: corrected, typewritten, double-spaced, one side of the paper in standard format. That leaves—at most—five hundred thousand.

Of those who do finish a manuscript, nine-tenths of them won't leave well enough alone. They start fiddling with it, rewriting, polishing, changing . . . until they have squeezed the life out and lose interest. Now we are down to fifty thousand.

Most of these survivors don't send their work off to an editor. Oh, no!—that involves the chance of failure and they're not ready to face *that.* Writers—all writers including scarred old professionals—are inordinately fond of their brainchildren. They would rather see their firstborn child ravaged by wolves than suffer the pain of having a manuscript rejected. So instead they read their manuscripts aloud to spouses and long-suffering friends.

This leaves only five thousand survivors who actually send their work to market.

So off it goes to an editor—and back it comes with a rejection slip.

This is very painful to the ego.

The usual amateur stops right there. He is so discouraged that he puts away his manuscript and forgets it.

Or he might send it out once more. The second rejection is even more painful than the first. It takes real stubbornness to send it out a third time. Only a handful will send a manuscript out four times. A still smaller number will keep on sending it out, as many times as necessary, until it sells.

For it *will* sell. If a manuscript has any merit at all and its author keeps on trying, eventually it will sell. Some editor will find himself facing a deadline with blank pages still to be filled. He reaches into the slush pile' and pulls out this manuscript that he recalls as being bad but not utterly hopeless, rereads it, and thinks, "Well, if I cut out that useless first page and start with the action—then tighten up the ending, cut out all those adjectives—then bluepencil this description of weather—it would just about fit. Peggy! Send this bloke form letter number two, the one that lets me cut to fit—and add that paragraph about how we would like to see more of his work but not more than fortyfive hundred words."

So now our hopeful is a published writer ... and if he has been as stubborn in continuing to write as he has been about keeping his work on the market, he will have some manuscript that has been rejected several times but which he finds he can cut from seven thousand words to fortyfive hundred—and does and finds that the cut version reads much better . . . and thereby begins to learn a most important lesson in the writing trade: that any manuscript is improved if you cut away the fat.

This last of five go-no-go gauges has eliminated another ninety percent. We started with fifty million; we now have only five hundred survivors.

These figures are substantially true. A few years ago my guild, the Authors League of America, made a survey to locate all professional writers. We found only four hundred who stated that they supported themselves and their families solely by freelance writing. All the others had some other basic income.

Let's allow for population increase and for any the survey missed—not many, the real professionals have their names plastered all over the newsstands; they can't hide. So call it a maximum of five hundred.

Only five hundred making their livings at freelance writing out of a population of over two hundred million. Less than one in four hundred thousand.

Yet I said that freelance writing is a soft touch. It is. Do you know of any other occupation in which a man can be his own boss, with no capital investment, no employees to worry about, no payroll to meet, no hours to keep, no need to meet the public other than when and where and how it suits him, live anywhere he wants to, dress as he pleases, work only three or four months out of the year, take long, long vacations—and still make a very comfortable living?

What he *does* have to do is to follow those rules, every one of them, every time, without fail—and keep on following them, for year after year after year.

It means working when you don't feel like working, even though there is no one to tell you that you must. It means following these rules even when you are disheartened by a long string of rejections and your head aches and your stomach is upset—and your wife thinks you are a fool not to look for a job. It means refusing to see your best friends when you are writing. It means telling your wife and children to get out of your study and *stay* out! It means offending people who can't understand that writing must *not* be interrupted—not for dinner parties, not for birth, not even for Christmas. It means getting a reputation as a bad-tempered, self-centered curmudgeon—and resigning yourself to living with that reputation no matter how eagerly you want to be liked—and writers do want to be liked, else they would not be trying to reach people through writing.

I probably haven't convinced you that those five rules are all it takes. But they are the business rules of anyone who makes anything and offers it for sale. Take a cabinetmaker specializing in handmade furniture. He must make furniture and he must complete each piece he makes. He never tears up a chair he has finished because he has thought of a better design. No, he offers that chair for sale and uses the new design to build another—this is the "no rewriting" rule.

Having finished a chair, he puts it on display and keeps it there until sold. At worst, he'll mark it down and put it in his bargain basement—and a writer does the same thing with a manuscript that fails to sell to high-pay markets; he puts his cheap-rate pen name on it and sends it to the endless low-pay markets . . . with no tears; words are worth whatever the market will pay—no more, no less.

A beginner finds hard to believe that no-rewriting rule. A myth has grown up that a manuscript to be suitable for publication must be rewritten at least once.

Utterly false!

Would you refry an egg? Tear down a freshly built wall? Destroy a new chair? Ridiculous!

This silly practice of rewriting is based on the hidden assumption that you are smarter today than you were yesterday. But you are *not.* The efficient way to write, as with any other work, is to *do it right the first time!*

I don't mean that a manuscript should not be corrected and cut. Few writers are perfect in typing, spelling, punctuation, and grammar. Most of us have to go back and correct such things, and—above all!—strike out surplusage and fancy talk. The manuscript then needs to be retyped—for neatness; retyping is not rewriting. Rewriting means a new approach, a basic change in form.

Don't do it!

A writer's sole capital is his time. You cannot afford to start writing until you know what you mean to say and how you mean to say it. If you fail in this, it is not paper you are wasting but your sharply limited and irreplaceable lifetime.

An instructor in English who requires a student to rewrite is reinforcing the worst possible habit in the use of language, the inability to say it right the first time. If the student thus abused is a midshipman, he may wind up the sort of officer who can't write a letter or a report without making half a dozen false drafts. The Navy does not have time for such nonsense. Efficient use of language is an indispensable tool of the naval profession. Under battle conditions it can make the difference between success and disaster.

The most valuable course I took here was one called "Order Writing." Its emphasis was on clarity. When a section met, each midshipman drew a slip which outlined a situation and told him what he was—task force commander, ship's captain, whatever. He had a few minutes to study it, then was required to write on the blackboard an order to fit the situation, then he was under fire from all sides. No rewriting, no second chance—if the instructor or any midshipman in the section could find any plausible way to misconstrue that order, his mark for the day was zero. Otherwise it was 4.0—nothing in between.

It was a *wonderful* course!

I think I have time to say one word about classes in "creative writing."

That one word is: *Don't!*

Creativity cannot be taught. One may teach grammar and composition; it is not possible to teach creative writing and any person who claims to do so is a fake. Creative artists are never taught; they invariably teach themselves. You can teach a young artist the tools of his trade; you cannot teach him to create. Nobody taught Shakespeare, or Mark Twain, or Edgar Allan Poe—or Erle Stanley Gardner or Rex Stout—and no one can teach *you.*

Science fiction—I don't write it because I am addicted to it; I am not. I've written and sold all sorts of things, technical articles, journalistic nonfiction, television scripts, detective stories, screenplays, adventure stories, even teenage love stories told in female first person. But I usually write science fiction because it turned out that I made more money that way. I did not become a writer to see my name in print; I didn't give a hoot about that and had no literary ambitions. I was a naval officer by choice; I became a writer by economic necessity. I needed to pay off a mortgage and started writing to get the money. I was in poor health and could not handle a steady job—nor were there any jobs; I was disabled out of the Navy during the Great Depression, a time when lawyers were driving milk trucks and graduate engineers were working as janitors.

But poor health is no great handicap to a freelance writer; he does his important work in his head and he can do that in bed. If he can sit at a typewriter a few hours a day a few weeks out of the year, that's enough. If he can get someone else to type for him, he need not get out of bed at all.

You don't have to be laid up to be a writer but a large percentage of writers *are* handicapped, and still more became writers because ill health or some other handicap cut them off from more active jobs. H.G. Wells started because pulmonary tuberculosis made him unable to continue as a teacher. Robert Louis Stevenson started out to be an engineer, then was forced into his brilliant writing career by chronic ill health. Cyrano de Bergerac—the man with the nose—is one of the many military men who turned to writing after being disabled in combat—and his novel "La Voyage a la Lune" is the first case of a sciencefiction writer using rocket propulsion for a spacecraft. A man in the class of '22 was disabled out about when I was and started selling sea stories. Another one, a World War One mustang, was retired for cancer. In the five years it took him to die, he taught himself to write and sold some sixty stories, science fiction based on his naval experience. I knew a civil engineer who broke his back during the construction of the Golden Gate Bridge and turned to writing adventure stories after he was crippled. And a polio victim crippled in both legs and one arm—but he could turn out seventy words a minute of clean copy with two fingers of his right hand. A classmate of mine was let out as a midshipman for heart trouble—and a heart attack killed him—but in the meantime he supported himself for thirty years as a writer. Booth Tarkington dictated several of his best sellers after he was blind.

I don't think anyone knows what the percentage is of writers crowded into the trade by such causes. But being unable to work at a regular job is a great incentive in forming those habits necessary to success in writing. *It teaches one also a great respect for the reader.* The ultimate cash customer *must* be pleased, or there is no repeat trade. An author must acquire humility about this. What he has for sale is a luxury; no one has to buy it.

I think of it as competing for beer money; this keeps me steady on course. My purpose is to make what I write entertaining enough to compete with beer. Not to be as great as Shakespeare or as immortal as Homer but simply to write well enough to persuade the cash customer to spend money on one of my paperback reprints when he could spend it on beer.

I ask myself: Does this entertain *me?* Does it amuse me enough that, if I found it on a newsstand, I would be willing to pay cash to read it?

Or does it bore me?

If it bores me, I don't write it.

But what *you* write and how *you* say it, is up to *you,* and no one else.

I am indebted to my wife for this definition of "plot." " 'Plot'," she told me, "is something thought up by professors of English to explain something that writers do anyhow."

There may be authors who plot their stories; I have never met one. Oh, an author often outlines what he intends to write. He may refer to that outline as his "plot." But I've never heard of a working author who worried about such things as "catastrophe" and "denouement" and "incitement" and "complications" and "dramatic unities" and suchlike fancy notions—nor will he let his written outline be a Procrustean bed. He *can't.* Once those characters come alive, once he can hear their voices, they live their own lives, they do as they please—and they kick that outline to pieces.

This is not just my own experience; I have heard it over and over again from other working authors.

For example: A few weeks ago we were shipmates with Miss Katherine Ann Porter, author of "The Ship of Fools." That story is three or four times as long as most novels. I asked Miss Porter if she had planned to write so long a story.

She answered, "Oh, heavens, no! I had a contract to write three 20,000-word stories. I wrote the first two, then I had trouble with the third. I finally had to tell the publisher that I simply could not meet the contract for the third one—the characters were living their own lives and I had to let them do so."

Back to science fiction— More than ninety percent of all science fiction is trash. This is an example of Sturgeon's Law: ninety percent of everything is trash. Certainly this is true of the arts; take a look around you. Plays, motion pictures, poetry, music, sculpture, painting, writing—almost all of it is trash.

And this has always been true. For every Beethoven and Michelangelo and Rembrandt there were at least a dozen competitors doing well enough to make a living but whose work did not survive the test of time.

The same is true of science fiction. H.G. Wells wrote most of his science fiction three-quarters of a century ago—and those stories are still read: "The Invisible Man," "The War of the Worlds," "The Time Machine"—they are in every public library, available in book stores, often seen on newsstands. But what of the Frank Reade series, published at the same time, extremely popular and all of them science fiction? Who reads them today? Who has even heard of them?

We find the same range in today's science fiction, from comic strips of the Buck Rogers sort to novels such as George Orwell's "1984" and Aldous Huxley's "Brave New World."

How many of you have heard of one book or the other—either "1984" or "Brave New World"? Hands up, please.

Thank you. How many have read one or the other of these books? Good. How many have read both "1984" and "Brave New World"?

Thank you. I think the ghosts of Mr. Orwell and Mr. Huxley have reason to be pleased; one book was published twenty-five years ago, the other just over forty. With thirty thousand new titles published each year it is hard to remember even the best sellers of five or ten years ago. Yet these two books are still fresh, still influential. Each makes us think, and the grim warnings in each are even more urgent today than when first published.

And both are acceptable as English literature.

And both are hardcore science fiction.

What *is* science fiction?

It is not prophecy. Despite the endless list of things which have appeared in science fiction before they were physical realities—radar, submarines, television, automobiles, tanks, flying machines, spacecraft, communication satellites, organ transplants, giant computers, atomic bombs, nuclear power—you name it—science fiction is not prophecy.

Nor is it fantasy—even though critics ignorant of science often have trouble telling the two apart. I am not running down fantasy; I enjoy it and sometimes write it. But fantasy is not science fiction.

Science fiction is *realistic* fiction. An analogous sort of nonfiction are the projections into the future called "scenarios," produced by such as the Hudson Institute,, the Club of Rome, and the Rand Corporation. They start with the real world and attempt to extrapolate the possibilities of our future history.

They ask themselves questions of the "What if—?" sort. What if a dozen or so of the less stable nations get atomic weapons? What if we lose the Panama Canal? What if someone develops a Doomsday Machine and it winds up in the hands of a dictator as crazy as Hitler? What if we are cut off from oil from the Mideast? What if China or Russia attempts a preemptive strike at the other?

These futurologists work in teams, using computers and many other aids.

A serious sciencefiction writer must attempt the same sort of thing, starting with the real world and asking "What if—?" But in stead of being a team of political scientists and military experts and physicists and psychologists and demographers, he must do it alone . . . then turn his scenario into a story which will entertain a reader—thousands of readers—or he has failed no matter how logically he has extrapolated the present into the future.

To do this—to write speculative fiction and have it make sense—a sciencefiction writer must start with a wide and solid foundation of facts. He needs thorough grounding in history—all countries, all cultures, ancient and modern. Geography—physical and political and economic—and this should be made real in his mind by travel, every continent and as many countries as possible. Law—he must learn as much as he can about law—from Hammurabi's Tablets on down through Justinian's Code and Blackstone and Code Napoleon and the Geneva Convention to the People's Courts in Communist countries and how they differ from our own.

Literature, languages—a man who knows only his own language doesn't really know any language. Science—he needs to be widely read in *all* sciences: biochemistry, meteorology, nuclear physics, descriptive astronomy, cosmogony and geogony, demography, anthropology, many more. He needs to know the philosophy of science, the nature of the scientific method, the difference between a natural law and a currently accepted theory. Mathematics—while even a professional mathematician can't keep up with all the new developments, nevertheless a serious writer of science fiction should be sufficiently at home with the language of science—mathematics—that neither Godel's Proof nor the methods of statistical analysis are strangers to him, nor Boolean algebra, nor multidimensional non-Euclidean geometry.

Engineering and technology—a man can't make intelligent projections into the future unless he knows present-day technology.

The man I am describing does not exist. I defined the Renaissance Man, who made the entire field of human knowledge his sphere. But it has been a long time since that was possible. Technology alone, by a conservative estimate, now doubles every ten years and has been doing so at least since World War Two. No man can keep up with such a flood of data.

Is it any wonder that ninety percent of all science fiction is trash?

Or that respected novelists of the contemporary scene almost always trip in their own ignorance if they try science fiction?

The surprising thing is that a small percentage of science fiction is *not* trash.

The situation is not as hopeless as I described it. A man who spends most of his time studying can make a stab at keeping up with the enormous mass of knowledge needed as a foundation for writing intelligent science fiction. But he must *enjoy* studying—anything and everything. Card games don't tempt him; he turns on television only when there is something he *needs* to see; he may go to one movie a year. But he finds Mark's Handbook fascinating and the World Almanac delightful.

I have met most of the best writers of speculative fiction of this century. Without exception I have found them to be men of insatiable curiosity about *everything.* For example, one of them—still alive and writing; I heard him lecture a few weeks ago—read the Encyclopaedia Britannica all the way through while an undergraduate . . . then read it through again while taking his doctorate—which surprised me; he doesn't usually need to read anything twice.

In his spare time he supported himself—writing science fiction.

Is it surprising that this man's science fiction is always sensible, solidly grounded on the real world, no Matter how wild his speculations may seem?

If you want to write and have insatiable curiosity, science fiction may be your dish.

Science fiction does have one superiority over all other forms of literature: It is the *only* branch of literature which even attempts to cope with the real problems of this fast and dangerous world. All other forms don't even try. In this complex world, science, the scientific method, and the consequences of the scientific method, are central to everything the human race is doing and to wherever we are going. If we blow ourselves up, we will do it by misapplication of science; if we manage to keep from blowing ourselves up, it will be through intelligent application of science. Science fiction is the only form of fiction which takes into account this central force in our lives and futures. Other sorts of fiction, if they notice science at all, simply deplore it—an attitude very chic in the anti-intellectual atmosphere of today. But we will never get out of the mess we are in by wringing our hands.

The clock is pushing me. Let me leave you with one flatfooted prediction of the sciencefiction type. Like all scenarios this one has assumptions—variables treated as constants. The primary assumption is that World War Three will hold off long enough—ten, twenty, thirty years—for this prediction to work out . . . plus a secondary assumption that the human race will not find some other way to blunder into ultimate disaster.

Prediction: In the immediate future—by that I mean in the course of the naval careers of the class of '73—there will be nuclear-powered, constant-boost spaceships—ships capable of going to Mars and back in a couple of weeks—and these ships will be armed with Buck-Rogerish death rays. Despite all treaties now existing or still to be signed concerning the peaceful use of space, these spaceships will be used in warfare. Space navies will change beyond recognition our present methods of warfare and will control the political shape of the world for the foreseeable future. Furthermore—and still more important—these new spaceships will open the Solar System to colonization and will eventually open the rest of this galaxy.

I did *not* say that the United States will have these ships. The present sorry state of our country does not permit me to make such a prediction. In the words of one of our most distinguished graduates in his "The Influence of Sea Power on History": "Popular governments are not generally favorable to military expenditures, however necessary —"

Every military officer has had his nose rubbed in the wry truth of Admiral Mahan's observation. I first found myself dismayed by it some forty years ago when I learned that I was expected to maintain the ship's battery of USS *Roper* in a state of combat readiness on an allowance of less than a dollar a day—with World War Two staring down our throats.

The United States is capable of developing such spaceships. But the mood today does not favor it. So I am unable to predict that *we* will be the nation to spend the necessary R&D money to build such ships.

(Addressed to a plebe midshipman:)

Mister, how long is it to graduation?

Sixty-two days? Let's make it closer than that. I have . . . 7.59, just short of eight bells. Assuming graduation for ten in the morning that gives . . 5,220,860 seconds to graduation . . . and I have less than 960 seconds in which to say what I want to say.

(To the Brigade at large:)

Why are you here?

(To a second plebe:)

Mister, why are *you* here?

Never mind, son; that's a rhetorical question. You are here to become a naval officer. That's why this Academy was founded. That is why all of you are here: to become naval officers. If that is *not* why *you* are here, you've made a bad mistake. But I speak to the overwhelming majority who understood the oath they took on becoming midshipmen and look forward to the day when they will renew that oath as commissioned officers.

But why would anyone want to become a naval officer?

In the present dismal state of our culture there is little prestige attached to serving your country; recent public opinion polls place military service far down the list.

It can't be the pay. No one gets rich on Navy pay. Even a four-star admiral is paid much less than top executives in other lines. As for lower ranks the typical naval officer finds himself throughout his career just catching up from the unexpected expenses connected with the last change of duty when another change of duty causes a new financial crisis. Then, when he is about fifty, he is passed over and retires . . . but he can't really retire because he has two kids in college and one still to go. So he has to find a job . . . and discovers that jobs for men his age are scarce and usually don't pay well.

Working conditions? You'll spend half your life away from your family. Your working hours? "Six days shalt thou work and do all thou art able; the seventh the same, and pound on the cable." A forty-hour week is standard for civilians—but not for naval officers. You'll work that forty-hour week but that's just a starter. You'll stand a night watch as well, and duty weekends. Then with every increase in grade your hours get longer—until at last you get a ship of your own and no longer stand watches. Instead you are on duty twenty-four hours a day . . . and you'll sign your night order book with: "In case of doubt, do not hesitate to call me."

I don't know the average week's work for a naval officer but it is closer to sixty hours than to forty. I'm speaking of peacetime, of course. Under war conditions it is whatever hours are necessary—and sleep you grab when you can.

Why would anyone elect a career which is unappreciated, overworked, and underpaid? It can't be just to wear a pretty uniform. There has to be a better reason.

As one drives through the bushveldt of East Africa it is easy to spot herds of baboons grazing on the ground. But not by looking at the ground. Instead you look up and spot the lookout, an adult male posted on a limb of a tree where he has a clear view all around him—which is why you can spot him; he has to be where he can see a leopard in time to give the alarm. On the ground a leopard can catch a baboon . . . but if a baboon is warned in time to reach the trees, he can outclimb a leopard.

The lookout is a young male assigned to that duty and there he will stay, until the bull of the herd sends up another male to relieve him.

Keep your eye on that baboon; we'll be back to him.

Today, in the United States, it is popular among self-styled "intellectuals" to sneer at patriotism. They seem to think that it is axiomatic that any civilized man is a pacifist, and they treat the military profession with contempt. "Warmongers," "Imperialists," "Hired killers in uniform"—you have all heard such sneers and you will hear them again. One of their favorite quotations is: "Patriotism is the last refuge of a scoundrel."

What they never mention is that the man who made that sneering wisecrack was a fat, gluttonous slob who was pursued all his life by a pathological fear of death.

I propose to prove that that baboon on watch *is* morally superior to that fat poltroon who made that wisecrack.

Patriotism is the most practical of all human characteristics.

But in the present decadent atmosphere patriots are often too shy to talk about it—as if it were something shameful or an irrational weakness.

But patriotism is *not* sentimental nonsense. Nor something dreamed up by demagogues. Patriotism is as necessary a part of man's evolutionary equipment as are his eyes, as useful to the race as eyes are to the individual.

A man who is *not* patriotic is an evolutionary dead end. This is not sentiment but the hardest sort of logic.

To prove that patriotism is a necessity we must go back to fundamentals. Take any breed of animal—for example, Tyrannosaurus rex. What is the most basic thing about him? The answer is that Tyrannosaurus rex is dead, gone, extinct.

Now take Homo sapiens. The first fact about him is that he is not extinct, he is alive.

Which brings us to the second fundamental question: Will Homo sapiens stay alive? Will he survive?

We can answer part of that at once: Individually H. sapiens will *not* survive. It is unlikely that anyone here tonight will be alive eighty years from now; it approaches mathematical certainty that we will all be dead a hundred years from now as even the youngest plebe here would be a hundred and eighteen years old then—if still alive.

Some men do live that long but the percentage is so microscopic as not to matter. Recent advances in biology suggest that human life may be extended to a century and a quarter, even a century and a half—but this will create more problems than it solves. When a man reaches my age or thereabouts, the last great service he can perform is to die and get out of the way of younger people.

Very well, as individuals we all die. This brings us to the second half of the question: Does Homo sapiens *as a breed* have to die? The answer is: No, it is *not* unavoidable.

We have two situations, mutually exclusive: Mankind surviving, and mankind extinct. With respect to morality, the second situation is a null class. An extinct breed has *no* behavior, moral or otherwise.

Since survival is the *sine qua non,* I now define "moral behavior" as "behavior that tends toward survival." I won't argue with philosophers or theologians who choose to use the word "moral" to mean something else, but I do not think anyone can define "behavior that tends toward extinction" as being "moral" without stretching the word "moral" all out of shape.

We are now ready to observe the hierarchy of moral behavior from its lowest level to its highest.

The simplest form of moral behavior occurs when a man or other animal fights for his own survival. Do not belittle such behavior as being merely selfish. Of course, it is selfish . . . but selfishness is the bedrock on which all moral behavior starts and it can be immoral only when it conflicts with a higher moral imperative. An animal so poor in spirit that he won't even fight on his own behalf is already an evolutionary dead end; the best he can do for his breed is to crawl off and die, and not pass on his defective genes.

The next higher level is to work, fight, and sometimes die for your own immediate family. This is the level at which six pounds of mother cat can be so fierce that she'll drive off a police dog. It, is the level at which a father takes a moonlighting job to keep his kids in college—and the level at which a mother or father dives into a flood to save a drowning child . . . and it is still moral behavior even when it fails.

The next higher level is to work, fight, and sometimes die for a group larger than the family unit—an extended family, a herd, a tribe—and take another look at that baboon on watch; he's at that moral level. I don't think baboon language is complex enough to permit them to discuss such abstract notions 'as "morality" or "duty" or "loyalty"—but it is evident that baboons *do* operate morally and *do* exhibit the traits of duty and loyalty; we see them in action. Call it "instinct" if you like—but remember that assigning a name to a phenomenon does not explain it.

But that baboon behavior can be explained in evolutionary terms. Evolution is a process that never stops. Baboons who fail to exhibit moral behavior do not survive; they wind up as meat for leopards. Every baboon generation has to pass this examination in moral behavior; those who bilge it don't have progeny. Perhaps the old bull of the tribe gives lessons . . . but the leopard decides who graduates—and there is no appeal from his decision. We don't have to understand the details to observe the outcome: Baboons behave morally—for baboons.

The next level in moral behavior higher than that exhibited by the baboon is that in which duty and loyalty are shown toward a group of your own kind too large for an individual to know all of them. We have a name for that. It is called "patriotism."

Behaving on a still higher moral level were the astronauts who went to the Moon, for their actions tend toward the survival of the entire race of mankind. The door they opened leads to the hope that H. sapiens will survive indefinitely long, even longer than this solid planet on which we stand tonight. As a direct result of what they did, it is now possible that the human race will *never die.*

Many shortsighted fools think that going to the Moon was just a stunt. But the astronauts knew the meaning of what they were doing, as is shown by Neil. Armstrong's first words in stepping down onto the soil of Luna: "One small step for a man, one giant leap for mankind."

Let us note proudly that eleven of the Astronaut Corps are graduates of this, our school.

And let me add that James Forrestal was the *first* high-ranking Federal official to come out flatly for space travel.

I must pause to brush off those parlor pacifists I mentioned earlier . . . for they contend that *their* actions are on this highest moral level. They want to put a stop to war; they say so. Their purpose is to save the human race from killing itself off; they say that too. Anyone who disagrees with them must be a bloodthirsty scoundrel—and they'll tell you that to your face.

I won't waste time trying to judge their motives; my criticism is of their mental processes: Their heads aren't screwed on tight. They live in a world of fantasy.

Let me stipulate that, if the human race managed its affairs sensibly, we could do without war.

Yes—and if pigs had wings, they could fly.

I don't know what planet those pious pacifists are talking about but it can't be the third one out from the Sun. Anyone who has seen the Far East—or Africa—or the Middle East—knows or certainly should know that there is *no* chance of abolishing war in the foreseeable future. In the past few years I have been around the world three times, traveled in most of the Communist countries, visited many of the so-called emerging countries, plus many trips to Europe and to South America; I saw nothing that cheered me as to the prospects for peace. The seeds of war are everywhere; the conflicts of interest are real and deep, and will not be abolished by pious platitudes.

The best we can hope for is a precarious balance of power among the nations capable of waging total war—while endless lesser wars break out here and there.

I won't belabor this. Our campuses are loaded with custard-headed pacifists but the yard of the Naval Academy is one place where I will not encounter them. We are in agreement that the United States still needs a navy, that the Republic will always have need for heroes—else you would not be here tonight and in uniform.

Patriotism—moral behavior at the national level. *Non sibi sed Patria.* Nathan Hale's last words: "I regret that I have but one life to give for my country." Torpedo Squadron Eight making its suicidal attack. Four chaplains standing fast while the water rises around them. Thomas Jefferson saying, "The Tree of Liberty must be refreshed from time to time with the blood of patriots—" A submarine skipper giving the order "Take her *down!"* while he himself is still topside. Jonas Ingram standing on the steps of Bancroft Hall and shouting, "The Navy has no place for good losers! The Navy needs tough sons of bitches who can go out there and *win!"*

Patriotism—an abstract word used to describe a type of behavior as harshly practical as good brakes and good tires. It means that you place the welfare of your nation ahead of your own even if it costs you your life.

Men who go down to the sea in ships have long had another way of expressing the same moral behavior tagged by the abstract expression "patriotism." Spelled out in simple Anglo-Saxon words "patriotism" reads "Women and children first!"

And that is the moral result of realizing a self-evident biological fact: Men are expendable; women and children are not. A tribe or a nation can lose a high percentage of its men and still pick up the pieces and go on . . . as long as the women and children are saved. But if you fail to save the women and children, you've had it, you're done, you're *through!* You join Tyrannosaurus rex, one more breed that bilged its final test.

I must amplify that. I know that women can fight and often have. I have known many a tough old grandmother I would rather have at my side in a tight spot than any number of pseudomales who disdain military service. My wife put in three years and a bit active duty in World War Two, plus ten years reserve, and I am proud—very proud!—of her naval service. I am proud of every one of our women in uniform; they are a shining example to us men.

Nevertheless, as a mathematical proposition in the facts of biology, children, and women of childbearing age, are the ultimate treasure that we must save. Every human culture is based on "Women and children first"—and any attempt to do it any other way leads quickly to extinction.

Possibly extinction is the way we are headed. Great nations have died in the past; it can happen to us.

Nor am I certain how good our chances are. To me it seems self-evident that any nation that loses its patriotic fervor is on the skids.

Without that indispensable survival factor the end is only a matter of time. I don't know how deeply the rot has penetrated—but it seems to me that there has been a change for the worse in the last fifty years. Possibly I am misled by the offensive behavior of a noisy but unimportant minority. But it does seem to me that patriotism has lost its grip on a large percentage of our people.

I hope I am wrong . . . because if my fears are well-grounded, I would not bet two cents on this nation's chance of lasting even to the end of this century.

But there is no way to force patriotism on anyone. Passing a law will not create it, nor can we buy it by appropriating so many billions of dollars.

You gentlemen of the Brigade are most fortunate. You are going to a school where this basic moral virtue is daily reinforced by precept and example. It is not enough to know what Charlie Noble does for a living, or what makes the wildcat wild, or which BatDiv failed to splice the main brace and why—nor to learn matrix algebra and navigation and ballistics and aerodynamics and nuclear engineering. These things are merely the working tools of your profession and could be learned elsewhere; they do not require four years together by the Bay where Severn joins the tide.

What you do have here is a tradition of service. Your most important classroom is Memorial Hall. Your most important lesson is the way you feel inside when you walk up those steps and see that shot-torn flag framed in the arch of the door: "Don't Give 'Up the Ship."

If you feel nothing, you don't belong here. But if it gives you gooseflesh just to see that old battle flag, then you are going to find that feeling increasing every time you return here over the years . . . until it reaches a crescendo the day you return and read the list of your own honored dead—classmates, shipmates, friends--read them with grief and pride while you try to keep your tears silent.

The time has come for me to stop. I said that "patriotism" is a way of saying "Women and children first." And that no one can force a man to feel this way. Instead he must embrace it freely. I want to tell about one such man. He wore no uniform and no one knows his name, nor where he came from; all we know is what he did.

In my home town sixty years ago when I was a child, my mother and father used to take me and my brothers and sisters out to Swope Park on Sunday afternoons. It was a wonderful place for kids, with picnic grounds and lakes and a zoo. But a railroad line cut straight through it.

One Sunday afternoon a young married couple were crossing these tracks. She apparently did not watch her step, for she managed to catch her foot in the frog of a switch to a siding and could not pull it free. Her husband stopped to help her.

But try as they might they could not get her foot loose. While they were working at it, a tramp showed up, walking the ties. He joined the husband in trying to pull the young woman's foot loose. No luck.

Out of sight around the curve a train whistled. Perhaps there would have been time to run and flag it down, perhaps not. In any case both men went right ahead trying to pull her free . . . and the train hit them.

The wife was killed, the husband was mortally injured and died later, the tramp was killed—and testimony showed that neither man made the slightest effort to save himself.

The husband's behavior was heroic . . . but what we expect of a husband toward his wife: his right, and his proud privilege, to die for his woman. But what of this nameless stranger? Up to the very last second he could have jumped clear. He did not. He was still trying to save this woman he had never seen before in his life, right up to the very instant the train killed him. And that's all we'll ever know about him.

This is how a man dies.

This is how a *man* . . . *lives!*

TRAMP ROYALE

An Ace Book

Preface

TRAMP ROYALE HAS spent almost forty years in the obscurity of the files.

It was written immediately after our return from a trip around the world in 1953 and '54, and sent on the rounds of publishing companies. But, at that time, there was a slump in the publishing business, and no one could see any possibility of publishing it. It was then put in the files and sent to the library at the University of California at Santa Cruz, and forgotten.

In 1989, an editor asked me whether Robert had any unpublished books. I recalled this one. So the library made a copy of the manuscript, and I sent it to that editor.

Now here it is.

It might strike you as odd that an out-of-date travel book should be resurrected and published. But there must be something interesting in it, aside from the dated prices and old hotels which might now be torn down to make room for more modern ones.

Homesickness is everpresent when one travels away from home. It might well have flavored some of this book. I hope that our friends from some of the places mentioned in this book will not take offense at what has been said. Robert wrote his observations of their hotels and cultures without pulling his punches. We both know from later observation that Australian hotels have changed for the better.

On looking back, I find the prices of those days laughable. Where could one get a suite for $22 U.S. these days? I'm sure that Singapore prices are far higher now. And $35 for an alligator bag! If you could find one now, I'm sure it would cost ten times that much.

The title of this book comes from a Kipling poem—"Sestina of the TrampRoyal"—which you will find on pages 371-72 of this book. The Britannica says of the sestina form: "A most elaborate form of verse . . . The scheme was the invention of the troubadour, Arnault Daniel, who wrote many sestinas . . . The sestina, in its pure medieval form, consists of six stanzas of six lines each of blank verse; hence the name. The final words of the first stanza appear in varied order in all the others, the order laid down by the Provencals being: abcdef, faebdc, cfdabe, ecbfad, deacfb, bdfeca. On these stanzas a tornada, or envoi, of three lines, in which all the key words were repeated in the following order:—b-e, d-c, f-a."

Such rigidity in form is probably not suited to beautiful poetry, and the Kipling verses are not his best, but the poem might have been influential in the writing of this book.

Enjoy this book as a period piece. It does not represent today's world at all. We enjoyed even the horrid parts of the trip in retrospect, but especially the homecoming. Being away from home for an extended period makes one appreciate one's home country.

I

Ten Suitcases

MY WIFE TICKY is an anarchist-individualist. I sometimes suspect that all females are anarchists in their hearts, with no innate respect for law and order . . . but on her it shows more. She is the sort of person who looks the wrong way at tennis matches. When she was in the Navy during the early 'forties she showed up one morning in proper uniform but with her red hair held down by a simple navy-blue band—a hair ribbon. It was neat (Ticky is always neat) and it suited the rest of her outfit esthetically, but it was undeniably a hair ribbon and her division officer had fits.

"If you can show me," Ticky answered with simple dignity, "where it says one word in the Navy Uniform Regulations on the subject of hair ribbons, I'll take it off. Otherwise not."

See what I mean? She doesn't have the right attitude.

I should have known better than to propose a trip around the world to her. Little-did-I-dream that I would spend the next forty thousand miles shaking in my boots for fear that she would wind up in some foreign calaboose while I tried to find the American consul.

The junket came about because we found ourselves last year with a drawerful of old, dirty money and no special use for it. I do not like to keep money around too long; the stuff shrinks like Colorado snow in a chinook—inflation, or they pass a new tax, or an operation, or something. Or someone comes along who can sweettalk me out of it. It never lasts long.

We had been talking more or less about building another house with it, renting it, and becoming fat and nasty as landlords. But building involves time as well as money; it becomes a demanding vice. The fascinating details of septic tanks and clerestories and insulation move in like Bermuda grass and take over the mind and imagination. For a fiction-writer such as myself this is a road to bankruptcy.

But it was necessary to do something before a distinguished stranger came along and persuaded me to invest in a Wyoming oil lease.

Ticky was out weeding on the terrace when I found the solution. I hurried out to tell her, approaching the matter with the finesse of a sailor on a four-hour pass. "Look," I said, "we're going to make a trip around the world."

I had placed myself to catch her if she fainted, or to join in the dance if her ecstatic response required exercise to work it off. She was able to control her enthusiasm. For about thirty unusually long seconds she continued to fiddle with a johnny-jump-up, then she said bleakly, "Why?"

"Huh? Don't you *want* to go around the world?"

"I like it here."

"Well, so do I. But we can't spend our whole lives in one spot. We grow roots. We vegetate. People will start searching us for sun scorch and scale bugs. Travel is—"

"Speaking of roots, I'm worried about those lilacs. I think I'll have to—"

I approached her gently and took a trowel out of her hand. "Ticky," I said gently, "listen to me. Forget gardening for a moment. We're going around the world. I mean it."

She sighed and let me keep the trowel. "Why? What has Timbuctu got that we haven't got more of right here? Except fleas, maybe?"

"That's not the point. I grant you that Colorado Springs is almost certainly a nicer spot than Timbuctu, but—"

"Then why go there?" "Why? Because I like to travel. I thought you did, too."

"I do. We went to Sun Valley less than a year ago. It was fun." She thought about it. "If you want to go abroad, let's go to Lake Louise. I've always wanted to go there."

"Huh? Canada is not `abroad'—it's not a foreign country."

"Ask a Canadian."

"Sure, sure. But it's really just a part of home that happens not to pay taxes to Washington. Pretty clever of them, too, come to think about it. But take Timbuctu, since you mentioned it."

"You take it. Let's go to Lake Louise and watch the glaciers glashe."

"All right, all right! We'll go to Lake Louise. We'll have dinner there tonight. It'll only take about three hours, not counting the hour to drive to the airport. We can discuss the trip around the world and make plans and tomorrow morning we'll come back and start arrangements."

"Mmm, no. Your tux is at the cleaner's and I haven't a dinner dress that is fit to wear." She took the trowel back from my limp fingers. "About next Wednesday, maybe. I'll have to buy some clothes and Sweet Chariot ought to be put in the shop for a day, just to be safe."

"What do you want to put the car in the shop for? It runs; if it will get us from here to the airport that's all I ask of it."

"Because we are going to drive to Lake Louise. No airplanes for me."

"What? Now wait a minute, slow up. We are *not* going to drive to Lake Louise. Since when this silly aversion to airplanes?"

"Since all these crashes in the papers. Airplanes are dangerous."

"Look who's talking! Leadfoot Lulu, the gal who thinks she is parked if she's doing less than ninety."

"I have excellent reflexes," Ticky answered with dignity, "but my reflexes are useless if a plane I'm a passenger in runs into a mountain. Which they've been doing."

"Which they do darned seldom. It's—"

"Once is enough. Once is too many."

"It's well known that modern airlines are the safest form of travel. Insurance companies no longer make any distinction between air travel and any other normal hazard. If there is anything as certain as death itself it is that insurance companies don't take risks; they operate on the same simple, straightforward statistical principles as the gambling houses in Las Vegas—the odds are picked so that the house always wins. It's the same with air travel; if these spectacular crashes were frequent enough to shift the odds, the insurance companies would change the rules in a hurry."

"Hmmph!" said Ticky.

"Hmmph yourself. Air crashes rate headlines simply because they *are* unusual. Take the Quintuplets—they got a lot of newspaper publicity, too. But what do you think your chances are of having quintuplets?"

"You aren't Mr. Dionne," Ticky answered darkly.

"That's beside the point. Don't you believe in statistics?"

Ticky pondered it. "Sure, I believe in statistics. But I've noticed that whenever I personally am a statistic I'm always way out at the end of the curve, instead of being comfortably toward the middle. They've got a plane crash all shined up, waiting for me to come along."

"Sheer solipsism. Paranoia. The Ticky-centric Universe."

"How else?" she answered contentedly and went on with her weeding.

I took a deep breath. "Ticky," I said, "listen to me. Put down that trowel and look at me. I'm going to put it in simple, Ticky-sized words and I want baby to try to understand it. I am going around the world. You are going with me because I need to keep you in sight where I can watch you and keep you out of trouble. We are going to fly."

"No."

"Yes. It's either planes or ships, and ships are a stupid waste of time. When you go by plane, you spend your time *being* there instead of killing days and weeks getting there."

"No."

"Yes. I'll bet your grandmother refused to set foot in one of those horseless carriages. But right now we fly, all the way around the world."

"No."

"Yes, we do. And when the time comes we'll take a rocketship tour to the moon, too."

So I firmly gave in. We ordered tickets for a round-the-world tour on one of the President Line steamships. It was a lovely ship, as the four-color folders showed—swimming pool, ballroom, private baths, movies, deck sports, beef tea in your deck chair in mid morning. By the time I got through studying the deck plans and the itinerary I no longer regretted not going by air. We applied for our passports and Ticky started making out lists.

That is, we applied for our passports after we sent in for certified copies of our birth certificates. Do you happen to know where *your* birth certificate is right at the moment? Or did the personnel office ever give it back to you after you applied for that job with Douglas back in 1942? You think it's with the insurance policies? I'll give you even money that the document you have in mind will turn out to be a New Jersey driver's license, expired. Americans, lucky people, even today need birth certificates only on very rare occasions. Hardly a half century ago they needed them not at all and very few had them. If an American wished to travel abroad, he did not need a birth certificate because he did not require a passport. All that he required was a letter of credit from his bank and leisure. It was literally possible for an American to wake up on Monday morning, decide to go to Europe, and be sailing, sailing over the bounding main on Wednesday.

Nowadays he had better allow three months as a minimum for the red tape. Six months is much easier on the nerves.

First the birth certificate: this takes about two weeks provided everything is clear sailing, that is to say that you know exactly what official to write to, his address and the amount of the fee that you must send. If you do not know, then you may be able to save two or three useless exchanges of letters by sending a money order for five dollars to the clerk of the county you believe you were born in. He will either do it himself and send you your change, or will pass it on to the proper official (in populous counties, such as those of New York City) who will most likely take care of it the following Tuesday if the photostat clerk or the vital statistics clerk is not on vacation.

Or he may send back the entire five dollars with a polite note informing you that "the records in question were destroyed by fire when the courthouse burned down in 1919." This is a penalty move and requires you to go back six squares and start again.

In my case the penalty move came in the form of a letter stating that "vital statistics were not kept in this county in the year named." This produced a scramble to achieve what is called a delayed registry of birth. Luckily I come from a family of pack rats; we were able to dig up a family bible entry, my first grade report card (good marks in arithmetic, poor in music, fair in deportment—none of this modern evading the issue), my cradle roll certificate, and a letter addressed to me by name on the occasion of my third birthday. There was also a lock of hair.

The cradle roll certificate had the wrong year on it, so we threw that out, but the other exhibits, in due and leisurely time, produced from the State of Missouri a document which said that my birth had at last been duly registered at the state capital. I breathed relief; at last I was me. I had attended school, been commissioned in the armed services, held two civil service jobs, married, voted, run for office, drawn a pension, and done all manner of things as a citizen and a flesh-and-blood being through more than four decades, all without having had any legal existence whatsoever. Now at last this little 4x6 slip of paper, issued by a clerk who had never seen me, assured me that I was real and therefore could apply for a passport.

I am not opposed to birth certificates. They are a nuisance only if you do not have one. But I am not impressed by them. There must be thousands (more likely, millions) of persons like myself in this country who managed to get born without benefit of statistics, nor do I find it reasonable to penalize a newborn infant for an omission on the part of government. Contrariwise, a birth certificate as a proof of identity—its only conceivable function—leaves much to be desired, as they are easily obtained illegally. If I were in the spy business and needed a U.S. birth certificate, I would—but why should I make it easy for spies? Especially when they know more about it than I do? I am sure that no Russian spy in this country ever lacked for an American birth certificate if he needed one for his unlawful occasions.

But an honest citizen can be very handicapped by the lack of one at times. If your birth was never registered, better take steps, as I did. If it was and you are serenely aware that you can always send for a copy if you need one, better send for one now; the courthouse might burn down again. Seven to two you won't! You will wait until it is indispensable, as I did.

Eventually we got our birth certificates and applied for our passports, with another short delay for passport photos. Those passport photos, the sort suitable to hang in a post office under a "WANTED FOR FRAUD" notice, are not accidental. The State Department prescribes the lighting and the pose; the public-enemy result is automatic. I cheated a little by smiling when I saw it was about to be taken.

Be sure to get at least a dozen and a half copies; foreign officials have a way of asking for two or more copies unexpectedly. I have no idea what they need them for or what they do with them. Scrapbooks? But failure to produce on demand can be as troublesome as losing your traveler's cheques. Have them. Carry them on your person when crossing international boundaries—a traveler fully fitted out these days to cross such an imaginary line has bulges all over his person like Tweedledee and Tweedledum outfitted for battle, and he looks and feels just as foolish.

In addition to a myriad pieces of stamped paper adding up to several pounds, he will, if he is wise, have at least two cartons of American cigarettes within easy reach and which he is prepared to give away at the drop of a hint. Bribery? No, "Squeeze"—a bribe is paid to get a man to do something he should not do; "squeeze" is something he demands of you for doing something you are legally entitled to have done anyhow, such as stamping your passport or passing your personal luggage. Most officials do not expect squeeze; those who do can make you miss trains, or worse.

While I am in a mood of reminiscent irritation let me state flatly that there is no limit to the variety of bureaucratic buffoonery placed in the way of legitimate travelers today and that it is my solemn opinion that none of it is of any use whatever. None of it is efficient enough to stop spies, smuggling, or illegal immigration. But the proof of the uselessness of any particular item of red tape lies in the fact that each procedure required by the laws of Ruritania will be found to be missing from the red tape of Lower Slobbovia, with no equivalent procedure to replace it. Instead, Lower Slobbovia will have a different silly mess of its own. This one impounds your passport, that one requires you to report to the police, this one so help me wants you to file an *income tax return* for a stay of four days, that one requires that you register your Kodak (but lets you take any pictures at all!), this one wants to know where your grandparents were born before it will let you simply change planes inside their sacred precincts. That one requires a cash deposit to guarantee that you will leave, then requires you to submit a freshman term paper to get it back when you do leave. This one—

But I could go on endlessly. Their name is legion and these steeplechase hazards to travel have in common in their endless variety only that they are all obnoxious and they are all useless. Pardon the irritation—I have been keeping my temper and smiling for the past forty thousand miles and my face is tired.

But after all it's their country, not mine, and if I don't like it, why didn't I stay home? True . . . but not the whole story. All of these countries are advertising in the States, ads paid for by the governments, urging you to come to beautiful Boskonia and spend those Yankee dollars; see any copy of *Holiday.* Many of them maintain government tourist bureaus in the States. Why, if they are so confounded anxious to improve their dollar balance with the "invisible export" of tourism, can't they refrain from treating a visitor like a juvenile delinquent being processed into reform school?

In order to apply for your passport it is necessary to appear in person at a court having jurisdiction and bring with you a witness who has known you for two years. You don't see the judge; you simply make out another one of those usual forms covering everything but your blood type, you pay the clerk a fee, and leave. Ticky and I found it no real trouble, since we live only a few miles from such a court and could ask a neighbor to go down with us. But in the open spaces of this country many people live more than a hundred miles from such a court (one empowered to naturalize foreigners). If you want the passport, you'll make the trip—but it is a far piece to drag a neighbor just to say, "Sure, I know him. And here's my driver's license to show who I am." Who feeds the pigs while he's gone?

Since the so-called appearance before a court is simply to fill out a printed form, swear to it, leave some photos and your birth certificate, plus personal identification by some other person who in turn need be identified only by papers, in what way would this weak procedure be further weakened if it were carried out by a local notary public who actually *does* know you?

I would not question the wisdom of the personal-appearance-cum-witness if the procedure were tight enough to discourage foreign agents from attempting to get American passports. An American passport is a valuable document; the black market price on them in some Asiatic ports is reputed to be from two to three thousand dollars and no doubt they bring more when they are then resold behind the Iron Curtain. But the present method for "identifying" an applicant is laughable as a security measure and is uselessly inconvenient to the honest applicant—and to his neighbor's pigs.

In due course Ticky's passport and mine arrived by registered mail from Washington. She examined hers smugly ... all but the picture. "It says here," she announced, "that the Secretary of State of the United States of America sends greetings and urges everyone to permit Ticky to pass freely. That's pretty nice of him."

I agreed that it was. "But we can't go anywhere with it yet. Now we have to get visas."

"What use," she wanted to know, "is a visa?"

Visas are of no use, none whatsoever. They are the epitome of functionless red tape, as meaningless as stepping on every crack while walking down a sidewalk. Many countries have abolished them entirely for all or almost all visits; other countries cling to them and make the obtaining of one as complicated and as annoying as removing an impacted wisdom tooth—South Africa and Indonesia, to cite two horrid cases. The endless questionnaires serve no purpose, since the desired answers are obvious and the international crook need only resort to cheerful mendacity. The fees are almost always too small to constitute worthwhile revenue in view of the overhead—often there is no fee; it is red tape for the sweet sake of red tape itself.

Saudi Arabia alone has a sensible visa system—eighty dollars for the visa, which is limited to Mohammedans, a head tax on pilgrims to Mecca, for revenue unashamed. My hat is off to Saudi Arabia, the straight bite and no nonsense about it. All the other countries are merely inconveniencing themselves and annoying the tourists they seek.

We started to get visas, then did a sudden about-face; our deposit had been returned by American President Lines. They thanked us for our interest and informed us that their round-the-world tours were booked solid for two years in the future.

I was ready to sit down on the curbstone and bawl. Ticky was not much more cheerful; she had been shopping for evening dresses to wear in the ballroom of the S.S. *President Monroe* and was all over her earlier lack of enthusiasm. She had carelessly and with assumed modesty informed all our friends that we were about to make a world tour. The idea of announcing publicly that it was all a mistake was unendurable.

She suggested that we go to Pueblo under an assumed name and spend three months reading *National Geographics,* then return home from the other direction. I was halfway sold on it.

But Mrs. Feyock took us in hand. Hertha Feyock is a cheerful little person who is the "World" part of the WorldWide Travel Agency in Colorado Springs. She speaks several languages, knows exactly how much to tip a Paris concierge, and has been to many of the places she deals in. "Don't you vorry," she said. "I'll find you a ship. There are some lovely Dutch ships running from South America."

I pointed out that we were in North America.

But she already had her head buried in folders, with a thumb tucked in a looseleaf book six inches thick consisting entirely of ship schedules. "I'll put together a tour," she said absently.

Which she did. It took a month to do it, a wastebasketful of letters, many toll calls and cables, and recasting of the overall plan as drastic as deciding to go around the world eastward rather than west when it appeared that the tentative schedule could not be made to jibe in

Singapore. But she did it. Planning a world tour by various means of transportation (rather than by a single tourist ship) is a project as complicated and unlikely as organizing a political campaign or trying to get six children off to Sunday School, all clean and neat and all on time. It calls for patience, expert knowledge, and optimism.

To attempt it yourself unassisted in the belief—entirely mistaken—that your costs will be less is as foolish as taking out your own appendix. But not as thrifty, for the travel agent collects not from you but from the transportation and hotel companies with no increase in price to you. But if you take masochistic pleasure in doing everything for yourself, go right ahead with either enterprise; the results should be interesting to others.

I can hear that plaint from the lady in the back of the hall: she wouldn't *think* of going to a tourist bureau; she doesn't want to find herself in a crowd of dreadful *tourists;* she wants to go to the *out-of-the-way* places.

"Tourist—(n.)—a person traveling for pleasure."—The Thorndike-Barnhart Desk Dictionary.

You may disclaim the horrid title, lady, but you are a tourist, once you leave your home town for any reason other than removal of domicile or business. That terrible couple over there with the impossible child (and he is a nasty little brat, isn't he?) resents your presence, your table manners, and your personality quite as much as you detest and despise them. You are all tourists together, so why not relax and enjoy it?

Nevertheless the yearning to go to out-of-the-way places where you will not be annoyed by other tourists and where you yourself will annoy only the natives is a legitimate one—in which case Thomas Cook and American Express and Mrs. Feyock and the other travel experts know much more about such places than you are likely to be able to learn unassisted. There are such places and many of them are lovely. Regrettably all of them are woefully short on inside plumbing, comfortable beds, and drycleaning service. Such amenities are directly linked to dollars, pesos, and pounds; they are provided only when there are enough tourists to make it pay.

Sometimes the lack of mass-production comforts is offset by native servants willing to work fourteen hours a day for small change in American money to provide you by hand with the machine comforts you are used to. You may be lucky enough to hear of such a place and go to it before the natives are "spoiled" (i.e., before they realize that they are being exploited). If you hear about such and want that sort of thing, go at once; if you read about it, buy your ticket the day the magazine appears. Otherwise you will arrive at the painful transition period when the place is already bursting with tourists, the prices have gone up, and the plumbing, et cetera, has not yet been installed.

Carry with you your own mosquito netting, soap, penicillin, toilet tissue, and a stomach rugged enough for any sort of cooking; out-of-the-way places have an infuriating habit of being out of the way. The unspoiled paradise, unknown to tourists and unlisted with the travel bureaus, exists in vast numbers throughout the globe. Africa, South America, Mexico, and Canada abound with them; even my home state of Colorado has dozens of them. But don't write to me asking for directions; get hold of Hertha Feyock instead. She will tell you how to get there and where you can hire pack mules for the trip. Or next time try Mars.

Mrs. Feyock finally put together the following itinerary. (See the map in the end papers, unless they have tucked it in somewhere else.)

Colorado Springs to New Orleans, train or plane

New Orleans to Valparaiso, Chile, by American freighter, via the Gulf of Mexico, the Caribbean Sea, through the Panama Canal to the Pacific, and with numerous coastal stops on the west coast of South America

Valparaiso to Santiago, Chile, by train

Santiago to Buenos Aires, Argentina, by plane

Buenos Aires to Capetown, Union of South Africa, by Dutch cargo liner, with stops up the east coast of South America Across Africa by local transportation, plane, train, et cetera; rejoin ship at a west African port

Across the Indian Ocean to Singapore, with island and west African stops

Singapore to Australia, via Indonesia (ah, Bali, beautiful Bali—more about that later)

Australia to New Zealand by passenger liner

The itinerary came to a sudden stop at New Zealand. Mrs. Feyock was still trying to book us by ship from New Zealand to our west coast at the time we left. No passenger ship was to be had, but it seemed to be just a matter of patience to book us on a freighter—a long, slow idyllic voyage, calling at mystic islands of the South Seas, all with names ending in vowels and sounding like endearments in an exotic tongue. I could see myself sitting on the fantail of such a ship, strumming on an old beachcomber and idly sipping a planter's punch, while the sun sank in the west and the colorful exotic natives gathered on the shore in their colorful exotic native costumes and bade the ship Aloha with their colorful exotic native songs.

I would feel her screw churning under me and the water, warm as new milk and clear as champagne, chuckling against the plates of the old rust bucket. After supper, served by boys who spoke only Pidgin but knew telepathically what you wanted before you knew yourself, the Captain and I would smoke a pipe on the bridge and swap yarns—then bed, for a night's deep, unworried sleep.

I began to feel like a Somerset Maugham character.

The only nibble we got was from the Matson Lines; all the others were "sorry" for one reason or another. The Matson Lines offered us "dormitory accommodations"—Ticky in a women's dormitory, me in one for men.

Ticky gasped. "What are those Matson Line people? Missionaries?"

We will omit my answer.

"Maybe we should explain to them that we are married. They may have me mixed up with Sadie Thompson." She scowled and then smiled. "Tell 'em 'yes' but that you'll take the bunk in the ladies' dorm and I'll take the one with the men."

"Okay, it's a deal."

"You're entirely too agreeable about it. Anyhow, they wouldn't let us. Missionaries! Well, I'm not going to do it and that's flat. Six weeks cooped up with a bunch of old biddies, watching them get in and out of their corsets and listening to their snores at night, is not my idea of a pleasure cruise. It reminds me of those old slave ships, where the mate would stick his head down into the hold the middle of every watch and tell them all to turn over at once. No!"

We both thought the dormitory plan was obscene and indecent, as well as having a flavor of Botany Bay about it that did not belong with paid passage. But our decision forced us to leave open the matter of passage back to the States. We told ourselves cheerfully that it would be easy to arrange in New Zealand, right on the spot. After all, ships left from New Zealand every day; we would make the rounds of the home offices and pick one that suited us. Our trouble was that we were trying to book passage from ten thousand miles away for a date six months off whereas no ocean freighter has a firm schedule that far ahead.

"Besides," I added, "New Zealand is supposed to be one of the nicest spots on earth. We might decide to stay there quite a while. We might take a room or a flat and hang around while I write a novel, in between admiring glaciers and kiwi birds and geysers and things. I might do a story with a New Zealand background, while I'm there and can check on the correctness of detail. Both of my readers must he pretty tired of the backgrounds I know now. I'm sure I'm sick of them."

"What you need, honey chile, is not a new background; it's a new plot."

I thanked her. Every writer needs honest criticism in his own home. We left it at that and turned our attention to visas and baggage.

The theory with a visa is that you get hold of the consul of the country in question, obtain from him a set of questionnaires, fill them out, mail or take the completed forms with your passport and fee back to the consul, whereupon he looks over the questionnaire, determines from it that you are a safe and proper visitor, then takes a rubber stamp and stamps your passport: "SEEN." That is all that "visa" means, just "seen."

This piece of tap dancing need not take more than a week or ten days if you wish to visit, let us say, Spain and nowhere but Spain. If you wish to visit several countries, it is still possible though tedious to accomplish in a short time provided you live in New York or Washington, D.C., and can take a few days off to walk your passport through from one consulate to another.

In our case we wished permission to visit nineteen sovereign countries, possessions, or colonies. Allowing a none-too-safe ten days for each transaction by mail and multiplying by nineteen gave an answer in excess of six months.

We had started our preparations to travel in mid June; it took until September to get passports and straighten out an itinerary; our first ship sailed in November. We had six weeks left in which to get visas. It began to look like one of those unsolvable mazes used by psychologists to induce frustration paralysis in laboratory animals.

Our State Department puts out a document listing the visa requirements of (almost) all other countries. We discovered that many countries had abolished this kindergarten procedure for the ordinary tourist. Most of these enlightened areas were in western Europe, not on our schedule, but several of them were in South America. The list that remained would still require two to three months if done by mail from Colorado—but the fine print came to our rescue: British consuls could grant visas for other British Commonwealth countries where said countries were not represented by consuls of their own. About two-thirds of our remaining list was British Commonwealth area—good! We would send our passports to the British consul in Denver and clear up most of it in a few days. As for places like French Tahiti, and Dutch New Guinea, and Portuguese East Africa, if we ran out of time before sailing, we would pick them up in person at any of several national capitals—Santiago, or Buenos Aires, or Rio, or even Pretoria. We would not be daunted by red tape, no, sir!

So we sent our passports to the British consul in Denver.

We waited for a week and nothing happened. Finally we decided to drive to Denver and inquire. Perhaps I should have done so in the first place, but I was fighting a deadline on a novel which had to be finished before we left. In my own case, at least, a loss of one calendar day in a writing schedule equals a loss of three writing days.

We arrived about one o'clock and found the consulate closed for lunch but a small sign informed us that it reopened at one-thirty. I spent the time trying to read "Come to Britain" posters through the glass door. At one-thirty-five a nice young lady with an English accent arrived in an apologetic rush, unlocked, and offered us chairs. We asked about our passports.

She dug them out of a file; nothing had been done to them. Nor could she help us; we would have to wait until the consul returned from lunch. Any minute, now? Oh no, he was attending a luncheon—three o'clock, perhaps.

We studied several pamphlets displayed on a rack: *Agricu1ture in the British Isles, Sports in Britain, Come to the Coronation, Historic Abbeys.* That is, I did so; Ticky spent her time making noises like a kettle about to boil. About three-thirty the consul returned.

He was a tall young man with a beautiful blond beard and he had the perfect, somewhat distant good manners of a top-drawer Britisher. "Awfully sorry to have kept you waiting, my dear chap. What can I do for you?"

We explained again. "Oh, yes, those— I had been wondering what to do with them. I'm afraid there isn't much I can do for you. According to your letter you aren't going to England."

I had come armed with the State Department publication about visas and I showed him the various notes in fine print. "We would like to have you issue visas for the Union of South Africa, Singapore, Australia, and New Zealand."

He blinked at the page and admitted that it did seem to say so. "Too bad, really. Sorry not to accommodate you."

"Then this thing put out by our State Department is wrong? Maybe it would be a good idea to write and tell them so."

"Well, it is not exactly *wrong.* But I once granted an Australian visa and became involved in such a dreadful bother that I decided never to do so again."

Ticky took a deep breath and I could see her muscles tighten. I jabbed her in the ribs, thereby saving temporarily an appearance of international amity. "Perhaps I did not make clear our situation," I went on. "We haven't time to send these passports around to each consulate separately. Couldn't you stretch a point, since you have the authority, and help us out?"

He shrugged. "Awfully sorry."

I stepped on Ticky's foot. "Well, I suppose you can issue the Singapore visa?"

He reluctantly conceded the point and we started filling out the same old forms—age, sex, occupation, place of birth, purpose of visit, means of transportation, race, permanent residence, marital status, *et* *cetera* ad nauseam. I was tempted to emulate a friend of mine who for years has been putting down his occupation as "necrophilist" without once having it questioned.

Presently we handed in our homework with our passports. After about ten minutes the young man with the beard stuck his head out and said cheerfully, "I seem to have ruined one page in Mrs. Heinlein's passport—the wrong rubber stamp. Sorry. I'll just scratch it out, eh?"

I grasped firmly Ticky's upper arm. "Quite all right."

It was about four-thirty when we got out of there, having at last received permission to change ships in Singapore but nothing else. Our British cousin relented a bit as we left. "If it turns out that you simply can't get those other visas any other way, come back another day and I'll see what I can do for you."

I thanked him and got Ticky out of there quickly before she could start quoting Patrick Henry. It was a cold, gloomy drive back in the dusk and Ticky was unusually silent. Once she spoke up. "I'd like to set fire to his beard."

We gave up and loaded the problem on the patient shoulders of my friend and business agent in New York, Lurton Blassingame. His secretary took the passports around by hand to each of the consulates in New York. Even this process cost twenty-seven dollars in long-distance tolls (to obtain questionnaires first) plus (as near as I can guess) about sixty dollars of his secretary's time, plus fees—all totaling around a hundred dollars for a ritual as useless as stamping white horses.

All but Indonesia— The Indonesian consulate in New York refused to have anything to do with our passports. We lived in Colorado Springs; Colorado lies west of the Mississippi; therefore our visas would have to be granted by the Indonesian consul in San Francisco, Q.E.D. and ipse dixit.

I pointed out, by long-distance phone, that while we might be in Colorado, our passports and paperwork were physically present in New York and would be delivered by hand along with the cash; couldn't they *please* stamp a visa on each of them under the circumstances?

"So sorry. No."

I explained with tears in my voice that there was no longer *time* to have some visas granted in New York and then send the passports to San Francisco. But their spokesman was adamant; rules were rules and had to be enforced.

As we were to learn later the new government in Indonesia is quite unable to enforce rules about murder and pillage, much less rules about public health and sanitation. But when it came to red tape, they had learned fast; they were as Western as a school board. ("Come to

Beautiful Bali, Last Home of Romance.")

All during the long campaign for reservations and the subsequent battle of the visas Ticky had been overhauling our wardrobes and we had both been stuck at odd intervals with hypodermic needles—cholera, typhus, typhoid and paratyphoid, tetanus, smallpox, yellow fever. This is one requirement for foreign travel with which I do not quarrel, since it is obviously of benefit not only to the countries visited but to the traveler. For technical reasons of biochemistry the yellow fever shot is very hard to obtain unless you live close to one of the half dozen U.S. Public Health offices which dispenses it. We did not, not by nine hundred miles, but we were able to obtain it as a courtesy from a nearby army post. The U.S. Public Health Service will supply on request a booklet telling what inoculations are required for travel in any part of the world; appended is a list of places dispensing cholera shots, free. They are not available commercially. Any traveler who needs one had better find out how he can get it most easily and plan for it ahead of time; the problem is not one of red tape nor of bureaucratic stupidity but one of inconvenient fact having to do with the present stage of medical art. There is no one to blame.

Ticky did not accept the requirements of inoculation easily. She stated that the navy medical corps had stuck enough needles in her to last her the rest of her life. I agreed and pointed out the alternatives: either she could let me go roam among the senoritas without mama to watch over me, or she could leave the country without inoculations—no one would stop her—and then find herself placed in quarantine for two or three weeks at the first port we reached . . . a process which would be repeated a dozen times around the globe, including San Francisco on return.

She stated positively and explosively that she would not go at all. But in due course she was baring her arms and her thigh and various other parts of her skin in Dr. Mullet's office and wincing as she was jabbed. I don't think the threat of senoritas convinced her. Ticky is as hard to convince as a cat, but, like a cat, she will submit to the inevitable. Just barely.

The first typhoid shot gave me a mild headache; I had no other reactions. Poor Ticky was distressingly ill from each and all of them—even her vaccination "took." I stipulate (though she does not) that it may have been psychosomatic, but the illnesses were real. She lost the better part of two weeks, just when we were busiest.

Because of the book I had to finish writing, almost all the endless running around necessary to get us started had fallen on Ticky. She was especially busy planning and shopping for our wardrobes. I first became aware of this early in the summer when she said thoughtfully, "I suppose we had better get some more luggage at once."

"What for? You take your big suitcase and your hatbox; I'll take my Valapak and the other suitcase. That'll be plenty. I can even let you have some room in my bags."

She shook her head. "We'll use the big suitcase for our skates and I'll pack my skating dresses around them. I was thinking of a wardrobe trunk for each of us."

"Skates—" I said, then took a deep breath and screamed, "Skates! Ice skates? Who are you? Barbara Ann Scott?"

"Don't be silly, dear. This trip is supposed to be fun, isn't it? Won't it be fun to look up the skating clubs everywhere we go? I'm thinking of doing an article for *Skating* magazine about it. Skating My Way Around the World, or Blades under the Southern Cross, or something like that."

I answered with dignity that *Skating* magazine did not pay anything for copy and that I hoped she would never bring up an immoral proposal like that again.

"I'm not asking you to write the article. I'll do it myself."

"It's a bad precedent," I answered sulkily. "Start a thing like that and it could lead anywhere. First thing you know I'd have to take a job—if you will excuse the expression—and go back to working for a living. You wouldn't want *that* to happen."

She did not answer. "Or maybe you would?" I went on, not quite so firmly. "Anyhow, it is absopreposterously out of the question. We can't drag thirty pounds of skates and a bushel of skating costumes around the globe just to skate a few times. If you find any rinks open in the southern hemisphere—which I doubt—we will rent skates and try them. I'll go that far with you. You can even take one skating dress. One."

"Rented skates," she said quietly, making the words an obscenity.

"Then don't skate. We live two blocks from one of the best rinks in the world. We are not repeat not spending all this dough just to compare one piece of frozen water with another. Ice is ice in any language."

"No, it's not. In Spanish it's *hielo*. I looked it up."

I withdrew to a previously prepared position. "Look, darling, I had been meaning to talk with you about this. The secret of happy traveling is to travel light. We'll take two bags each, one for each hand. That way we can always move them ourselves if we have to. There is nothing worse than to be stuck out in the middle of a pouring rain with a big stack of baggage and no porters or taxicabs to be had for love or money. And even if you do find a taxi, in a lot of those hot countries the first thing the driver does is size up your luggage. If you've got a lot of it, then you must be rich and fair game; he multiplies the normal charge by the number of your bags."

"So you tell him firmly you won't pay it."

"And sit there in the rain? No, if you have just the baggage you can carry, as we will have, you walk off and look for another taximetro. He follows after you and offers you the right price."

"Robert A., if you think I'm going to show myself to people all over the world in clothes that came out of one bag—and look it—think again. You like to see me nicely dressed. The very first remark you ever made to me was, 'Your slip is showing.' "

"You can be nicely dressed with just two bags. Pan-American puts out a list that shows you just how to do it."

"Written by the same chap who tells how to make tasty meals out of leftover scraps, I'll bet."

"It isn't like dressing here at home. You're not going to be seen by the same people each day, so each outfit is as smart as the first time you wore it."

"So? We are going to be in that Dutch ship for six weeks. Do you want me to wear the same black dinner dress every evening for forty-two days, not forgetting the Captain's Dinner?"

I shifted tactically. "Another thing, if you have a lot of luggage, it takes forever to get through customs."

"Why? It can't take long to mark a chalk mark. I've seen them in New York."

"Honey, do you know what that chalk mark means?" "Should I know?"

"It means that the customs officer has unpacked everything in it, searched it, and passed it. You have a lot of stuff, tightly packed, and it takes him forever to paw through it."

"Paw through *my* clothes?"

"Of course. That's what he's there for, to search the stuff."

"But that's silly. Where did you get that idea? When Aunt Lou got back from Europe she just handed the man a list of what she had bought outside the country; he took it and made some chalk marks. It took about thirty seconds."

I nodded. "So it did. She had declared a reasonable amount, she had her list made out in advance, and she didn't smell like a smuggler to him. So he passed her. They can't do a skin search on everybody and we are granted such liberal free allowances that most people don't try to smuggle. But if he had been suspicious—well, they are quite capable of taking you to a private room, stripping you down and going through your bags with knife blades and probes. When it comes to dope or jewels they even go after the body cavities—and I do mean *all* of them."

Ticky slapped the table. "That settles it! I'm not going."

"Slow down. Level off and get your flaps down or you'll overshoot the field. That sort of thing happens only when the customs authorities have received a tip from their informers abroad that a particular person is going to attempt to smuggle—and they rarely make a mistake. If a foreign customs officer tried it on us, I'd yell for the American consul so loud that they would hear it in Washington. But they won't. Customs officers aren't fools. What they will do is to search our baggage. Most other countries have much stricter import and tariff regulations than we have—so they search everything that comes in. But nobody is going to lay hands on my redhead, don't you worry."

"And they aren't going to go pawing through my clean underwear either. I won't stand for it."

The discussion continued without reaching a conclusion. Ticky did not insist again that she was not going, but she never gave in to the idea that a strange man should be allowed to handle her clothes. Once she suggested that she could carry along white gloves and tell the inspector to put them on before he touched her things. I was tickled by the picture of Ticky holding them up and saying, "One moment, Senor, before you commence—" But I was scared by it, too. She was quite capable of doing it—and what a proud Latin official would do when he finally understood that the *norteamericana senora* was suggesting that his hands were too dirty to touch her possessions I did not like to think about.

He would not touch Ticky. Latins are much too gallant for that, no matter what the provocation. But I enjoyed no such immunity; I would wind up in the calabozo.

What Ticky would do then I did not even dare guess. It would be something like the behavior of a lioness deprived of her young and it would not even have a speaking acquaintance with the amenities of international law.

Maybe we really should stay home.

The question of how much we should take with us got lost in the muddle. I made feeble protests from time to time but the number of evening dresses and sports clothes and accessories grew. Then she started in on me and I got slacks and tropical suits in these new materials that can be washed, so it says on the label, and do not require pressing. This seemed sensible so I shut up. Then a new white evening jacket. Then a stack of sports shirts for shipboard wear. I quit fighting and decided to enjoy the lovely new wardrobe instead.

There were ten pieces of luggage when the day arrived, all packed to bursting. It took two trips to get them to the station.

II

South to the Southern Cross

SANTIAGO, *CHILE—Manuscript found in an Old Pisco Bottle:*

"Is anybody listening? Is there anybody there at all? I am stranded on the fourteenth floor of the Hotel Carrera and I seem to be about to fall out of touch with the rest of the world entirely. I can't sleep properly. Almost every twenty-four hours I wake up at least once and have to struggle up two flights or *pisos* to the *piscina* on thee rrroof and sip a pisco sour while I watch the senoritas sunning themselves and swimming in the *piscina.* Then I crawl back down and fall again into the *matiana* coma.

"Orion is upside down and people eat dinner in the middle of the night and a simple request for drinking water requires endless protocol and much waiting. But all forms of alcoholic beverages are readily available everywhere and the chambermaids whisk busily in and out of thee bath while I am bathing, cooing gently at each other like turtle doves (rootly-boo, rootly-boo!). The hired help work in committees, talking and using their hands and very cheerful, but not necessarily accomplishing anything. The same hired help is evident at all times and everywhere. If Ticky and I close the roof garden at four, the same patient waiter with the Indian ancestry and total lack of English offers us breakfast in the grisly light of noon. They must hang them on hooks.

"Can you hear me? Can you speak English? The guidebook says that almost everybody here can speak it but the guidebook is wrong. I am beginning to feel unreal. I—"

The above is roughly the effect on a couple of gringos of first exposure to the druglike, almost unbearable sweetness of our Latin American neighbors. We visited seven such countries; I state the simple truth when I say that not once did we hear a harsh word, never were we scowled at, no one was ever too tired or too busy to be patient and kind to us. Nor is it fair to attribute this continent-wide courtesy to the Yankee Dollar; most of these encounters had nothing at all to do with money.

It seemed to me to be the finest outward expression of true individualism: each man respected himself; this inner respect, his awareness of himself as a unique person, required him to extend to every other human being everywhere and of any economic station a dignified courtesy which recognized tacitly the unique worth of both his fellow human and himself.

My analysis may be wrong, but the outward fact remains. This account reports what I have seen, with my opinions tossed in to fill up some of the white space. I have never understood how globe-trotting columnists can take a quick look at a country and come up with all the answers to all problems, economic, political, and social. I can't possibly do so because I don't know enough history, geography, psychology, economics, science, anthropology, or whatever, nor can I keep up with the endless spate of new facts. Even my own home town confuses me; every time I think I have reached the "facts" I find another layer underneath, like peeling an onion. How can I do justice to a country, a continent, a globe?

Nevertheless, it does not take a biochemist to detect a rotten egg in an omelet. Some things that are right, others that are wrong, about a country can be seen even from a tour car. When you see a 65-year-old woman staggering along under a load that would cause an American stevedore to fetch a fork truck it does not require a Guggenheim grant to determine that something is crumby about the way that country is run.

I shall set down my opinions whether they constitute complete answers or not.

We left Colorado Springs on 12 November by train, after having shipped half of the ten suitcases by express in order that we might go by air, only to receive a telegram immediately after shipping telling us that S.S. *Gulf Shipper* would be three days late in sailing—a routine mix-up in traveling. So we left in the middle of the night from a bitter cold railroad platform instead of in bright daylight in the gala atmosphere of an airport. But a biggish crowd of our friends came down to see us off anyhow, the Knowleses, the Herzbergers, Eileen Seigh Honnen, the staff of the WorldWide Agency, three assorted young ladies whose names I did not catch, and a Free Press photographer came down to see us off, and Bob Wirt of WorldWide presented Ticky with green orchids and the Nelsons and Mrs. Feyock gave us candy (which we ate to the equator). We had our pictures taken on the steps, then waited through a long anticlimax for the train to pull out late.

We were off! Into the Wild Blue Yonder, enduring the hardships of a Pullman drawing room. Actually, I had forgotten just how dismal a way to travel a train is. Like most Americans I have learned to go everywhere in my own car (needs a tune-up and one new tire, but reliable) or, if really in a hurry, by air. This is not counting a mule descent into the Grand Canyon, or a week's pack trip by horse of which the less said the better. Now a Pullman drawing room is luxury travel and it costs a bit more than air travel. It is noisy, dirty, uncomfortable, monotonous and slow, and sleep is almost out of the question. The engineer employs a spy to make sure that he uncouples the diner just as the razor reaches the point of my chin and the water tastes of old iron.

We changed trains in Fort Worth and soon we were in de land ob cotton. Looked pretty bad, too—not much of a crop this year. The drought really raised hell with the farmers. We arrived in New Orleans Saturday morning and were delivered to the Maison de Ville at breakfast time, short precisely two nights of sleep.

Unfortunately check-out time was three o'clock and our rooms were not available. We carried the banner through the French Quarter Until-the afternoon. This is a painful and groggy episode which I remember dimly save for one item, Loni's Vieux Carre Lingerie Shop at 218 Bourbon Street. Loni deals in custom-made frillies for frails of really amazing sorts—panties with clutching hands embroidered on same, others with appropriate mottoes, if you happened to be very broadminded, things which I dubbed bedroom Bikinis but which Loni assured me were "home Gstrings." None of these items were built for heavy wear; all were intended to be removed promptly and (we trust) with care, as they were beautiful and fragile.

One mannequin, the mascot of the shop, was seated, completely dressed and quite naked, in the middle of the shop rear. She is known as "Ophelia."

We were tempted but I limited myself to a pack of playing cards, the only non-wearable item offered. The conventional designs on these cards had been replaced by pictures in gorgeous Kodachrome of young ladies who did not patronize even Loni's liberal establishment. After all, were we not about to barter in the bazaars of the crossroads of the world?—dickering with and outwitting mysterious Hindus in quaint little stalls in Zanzibar for the mysterious treasures of the Orient, then to wait until we returned to the ship to decipher the mysterious cabalistic mark on the underside saying MADE IN CAMDEN NJ FAIR TRADE PRICE $1.75? After all, Loni plies her trade in the States and promises "Mail Orders Filled Promptly."

We dragged ourselves back to Maison de Ville, taking turns carrying the playing cards, and slept in chairs in the lobby until our predecessors checked out—and were then informed that the ship would sail on Tuesday instead of Sunday. This is known as the Missing Top Step. So we went to bed and slept until dinner time.

There was the usual queue on the sidewalk outside Antoine's; we did not tarry. I have never eaten at Antoine's and do not intend to do so ever; any restaurateur who lets his patrons stand on the sidewalk instead of providing room enough to sit down is welcome to the suckers he gets—but I'll be a sucker sitting down, thanks. We went to Todt's on Bourbon, an excellent French restaurant with a German name. *Mme.* Todt is a tribute to her own cooking. The place is beautiful, ancient, quiet, leisurely, and the cooking is superb. We began to dig our graves with our teeth, wide and deep, a process likely to continue for 40,000 miles.

We wandered away from Todt's, belching gently and walking carefully. We had no intention of spending the evening in the clip joints of the Vieux Cane, no sirree! We were going to a movie. But careful inspection of a newspaper disclosed that nothing was showing but Hollywood's revenge for television. On the way back to Maison de Ville we decided to indulge in a small spot of social research, as we had heard that the town had been cleaned up. We stopped in one of the joints to find out.

It was true. The girls no longer danced on the tops of the bars, but on runways arranged among the customers, an arrangement more sanitary and more convenient. Nor did they strip completely. No matter how many bows they took, each retained a Gstring at least the size of a cigarette package and in place of a brassiere (which might have become dislodged in the enthusiasm of the dance) each wore two little stickers based on the principle of the "Posees" which enjoyed a brief rage a few years back, but differing from that adhesive bra in being smaller, say an inch and a half to an inch and three quarters wide. These little modest stickers were often of a natural rosy hue, but some were silver, some were gold, and some were covered with sequins, giving pleasant variety. Some of the young ladies had tassels appended to these stickers, which accented their movements. One had four tassels, two in front and two fastened to the bulges of her glutei maximi. Such was her athletic skill that she could start or stop any of the tassels independently, swinging them in time with the music. The tassels had been treated with fluorescent dye, producing a giddy and pleasing effect of mobile mathematical patterns.

We left this establishment without having suffered undue financial damage and were just about to turn into our home street when we saw a sign advertising the leopard woman. We went in. The dive was grimy but the show was all that it was billed. I mean to say: where else can you see a naked woman rassle with a full-grown leopard thirty-nine inches from your nose and no bars? This act was all that it was represented to be and it struck me as damned dangerous. Sure, she did her strip by having the leopard claw and/or bite her clothes away, just like Lolita and her Doves and that gal who used to do the same act with a parrot. But the thing that got me was that apparently bad-tempered leopard practically stepping in my half-ounce cuba libre. It made me so nervous I had to sit through the show twice.

The Maison de Ville is a luxury hotel run like a very well run French pension, by a Mrs. Ehrlich, who came down from the Nawth, liked the town, bought this hotel and stayed. It is small, very personal, and very well managed. The new wing was built in 1800, which gives you some idea. The patio is lush, old, and cool, with green moss covering the ancient bricks. There is a wishing well where you may chuck a penny if you have any wishes left unsatisfied, which seems unlikely. A complimentary continental breakfast is served until eleven o'clock in this patio and it opens into the much larger patio of the Three Sisters, where everything is served, from Sazerac cocktails to lobster mayonnaise.

Having seen New Orleans before, we had not intended to spend much time there, but the delay in sailing left us with a couple of days to kill. On Sunday we took a rubberneck trip and found that in New Orleans such a trip is not to be scorned. There are many things there which need to be pointed out and cannot be seen just by poking around—such as the canals that are above the level of the adjacent streets and many old fine antebellum homes which would give a housekeeper nightmares. And there is the cemetery that used to be a race track until one man was refused membership, whereupon he resolved to make it the deadest place in town. He did so—he bought it and it is now a very beautiful cemetery.

Thereafter we wandered down to the waterfront, had coffee at the Morning Call (an obligatory ritual) and found the *Gulf Shipper.,* Captain Rowland W. Dillard was aboard and very kindly showed us around. Captain Dillard is usually Chief Mate of the *Shipper,* but had just completed a voyage as C.O. during the vacation of Captain Lee. We soon discovered that he was a retired naval officer, whereupon we admitted that we were Navy files, too, and became *muy simpatico* in an atmosphere of "Did you know so-and-so?"

We firmly resolved to see a movie that night, several bills having changed—but found that Hollywood's Chinese suicide was still going on. So we started back to Maison de Ville. At the corner of Toulouse and Bourbon, fifty feet from Maison de Ville, is the Old French Opera House. I pointed out that it was much too early to go to bed; why not sit through one show?

We did. At this point begins the confirmation of the Louisiana Purchase. I now own one New Orleans night club, having bought and paid for it. Through some oversight the deed has not yet been sent to me; however, we have been traveling; it may be awaiting us in the States.

The O.F.O.H. promises continuous entertainment. We sat through one show and were just preparing to leave when the first M.C. sat down beside us, the relief M.C. having taken over. "How do you like our show?" he asked. "Fine," I agreed and presently asked him to have a drink. He accepted.

Three hours later I was still buying drinks for him and for a little blonde stripper named Pam. There is no cover charge but the drinks are very small and the prices are high in inverse proportion. I must say at this point that I enjoyed every minute of it, save that all too often I was busy making change or tipping when I should have been giving careful attention to the artistic and uninhibited dancing going on at a point averaging one meter from my bulging eyes.

These dives on Bourbon Street vary a good bit. I must say for the O.F.O.H. that it smelled clean, it looked clean, the glasses were clean, and the girls were young, pretty, healthy, And looked freshly bathed and not tough. If you are relaxed to the fact that the purpose of the place is to show pretty girls in as much skin as the gendarmes will permit, then the O.F.O.H. is the place for you; it is a nice joint of its sort. The jokes are not too rough and feature neither bathroom humor nor fag humor. Paul, the M.C. who sat with us and helped us complete the Purchase, was half Gypsy, the son of a tightrope artiste and had as his ambition to own and operate a small carnie wild-animal show—toward which he had a fair start, including a boa constrictor that slept with him on cold nights. He was in the market for a mountain lion kitten.

Pam, the little blonde stripper who joined us presently, was suffering from a hangover and love. She and the trap drummer planned to get married, but would have to wait a bit as he was buying a new set of traps. She assured us that she could cook. It seemed that everyone in the show was suffering from a hangover, the preceding night (Saturday) having been very drunk out, including among other things, Pam having had her bar bill cut off by the manager and retaliating by taking off her shoes and throwing them at him. One of the girls had threatened suicide and Paul had had to go into their dressing room and quash it. There was no general agreement as to which girl was threatening suicide but all agreed that someone had.

We were supplying the hair of the dog—at house prices.

I don't know how I got out without paying the French War debt as well, but I did, eventually. Actually, both Paul and Pam were nice kids; Ticky and I liked both of them. Pam was 21 and had been a stripper since she was 13, at which time her mother used to take her to and from work. Ticky asked her if she weren't scared when she started. Oh yes! but now it was just a job, a better paying job than working in an office. The girls make $75 to $90 a week. There is no real future in it, of course, and it is inclined to turn them all into habitual drinkers if not alcoholics. I haven't the slightest idea how many of them end up in bagnios—probably most of them get married. If stripping damages their moral fibre, I was unable to discern it.

We went aboard ship the next day, came ashore for dinner, having been warned by the purser that the crew was being paid off and that there were some beefs which might result in bad language and unpleasantness. We finally went to a movie, *Veils of Bagdad* or some such, featuring Victor Mature in improbable situations. I went to sleep. Ticky woke me and took me back to the ship.

The *Gulf Shipper* was warped away from dock and headed out into the stream by towboats about 1000 Tuesday morning. We spent all day watching the lower or delta reaches of the Mississippi, counting pelicans and one (1) porpoise. (No score is credited for seagulls.) The delta Mississippi is an improbable place. From the deck of a ship one can see right over the tallest trees to the horizon, stretching around through 360 degrees as in the flattest parts of western Kansas. The highest land seems to be roughly 21 inches above water and the black gumbo mud runs down to China. Vegetation is lush, thick and low, something between canebrake and jungle. But there are farms and cattle ranches back in here, paved roads and many oil wells. One wonders what they do at high water.

Almost down to the Gulf the Delta pilot leaves the ship, at Pilot Town, a town built on stilts, and the Bar pilot takes over. The Bar is a neighborhood rather than a channel—the lower portion of the multiple mouth of the Mississippi changes so rapidly that it must be piloted by a man who has taken a look at it just a few hours before. You can almost see him moving his lips as he comes aboard, concentrating on remembering the latest twist of Old Man River. He takes the ship out into the open Gulf as the sun goes down, then with a sigh of relief turns it over to the skipper.

We went to bed.

Next morning we were out of sight of land, on the open blue Gulf, lying in deck chairs and counting flying fish instead of pelicans. The sea was almost glassy with the ship moving gently, rolling almost imperceptibly and lifting a trifle to long, slow, low swells. Nevertheless it was enough to bother one passenger, who started missing meals at once. The rest of us started getting acquainted—Ticky and myself, Vi and Robert from Hawaii and off on a busman's holiday to the tropics, two couples from the same middle west town who kept much to themselves, and Mr. Tupper. Mr. Tupper was known either as "The Cruise Director" or as "The Owner"—it was his third trip in this ship, he had his own sextant and navigated with the mates each day, he had a stateroom right on the bridge, one which had apparently been intended as an emergency cabin for the skipper in wartime. He was not a seafaring man by profession, but a retired insurance executive from Atlanta, Georgia, who had made a hobby of the merchant marine in his old age and had studied navigation in order to enjoy it the more. He was the life of the party, the benign spirit of the ship, with an endless string of anecdotes and "animal stories," always funny, and with a case of Old Parr under his desk in case something—such as sighting a whale, or a boat drill, or such, should make him and his companions "nervous."

He assuaged my nervousness on numerous occasions. GSA should give him his passage free and charge the other passengers extra, should they be lucky enough to sail with him.

We passed the west end of Cuba the next night and were in the Caribbean, which looked just like the Gulf. I looked for the furrows I had worn into the Caribbean as a kid thirty years ago, but they were gone. All is change, there is nothing you can really depend on. The Captain gave a cocktail party which made up for it. He put on a uniform for the first time, too (freighters are *very* informal)—dress whites. Captain Lee is a tall, handsome man in his early forties and looks the way a skipper should look. He has a very heavy hand with a cocktail shaker.

The skipper went to sea as a boy, shipping before the mast, and worked his way up through the hawsepipe through all ratings from ordinary seaman to master mariner. This personal saga of the sea is probably passing today, as a consequence of the founding of the U.S. Merchant Marine Academy. No doubt this transition represents progress, but one thing is sure: the oldstyle skipper has a knowledge of his ship and the job of every man in it which cannot be learned in a school room.

Captain Lee kept a very taut ship. There was overt evidence in clean paintwork and well-shined brightwork but the most compelling evidence was negative; the ship had no odor. Almost every ship that sails the sea holds a pervasive, inescapable stink compounded of bilgewater and a dozen other ancient, organic whiffs. In a dirty ship it is almost unbearable; in a clean ship it is so slight as to be inoffensive when the weather is calm, the ports open, and the stomach is easy. But one does not expect it to be missing entirely. The *Gulf Shipper* had none that I could detect.

Later on we were conducted through all parts of the ship, engineroom, holds, lower passages, crew's quarters, galley, lockers, iceboxes—and I could see why. The ship was clean. Not just reasonably clean, but clean. The Captain inspected the ship each morning from stem to sternpost. When he inspected during our first day at sea I was asleep, with our door closed. He did not knock but noted down that he had not been able to enter stateroom number three and returned that afternoon to complete his inspection.

He did not simply stick his head in, glance around, and ask us if everything was all right. He came in and tried everything himself—plumbing valves, porthole dogs, medicine cabinet door, wardrobe doors, drawers. There was a steel chest of drawers welded to the bulkhead; Captain Lee found that one drawer stuck, so he squatted down, took hold with both hands and attempted to make it work.

He is a large man and powerful. With a sound of ripping metal the entire steel chest parted from the bulkhead and came away in his hands. He looked at it soberly and remarked, "I'll send one of the engineers up to fix that."

Freighter travel can be very pleasant. If you insist on the combination of swank hotel and organized children's party which characterizes a smart North Atlantic liner you will be bored and miserable in a freighter, for a freighter offers only meals, room, and transportation; the rest is up to you. I am not sneering at luxury liners; real luxury can be a lot of fun. Freighter life is a different sort of fun.

The staterooms are usually larger than any but the most expensive in a liner and they are always outside rooms. Ours in the *Gulf Shipper* had a private toilet and shower, contained two single bunks and a large couch, had three ports, and was roomy enough to set up a card table. Outside the passengers' rooms were wide verandas with deck chairs. There were no deck stewards hovering around; if you wanted your chair moved, you moved it; if you wanted a cup of coffee or tea, you went down to the pantry and got it.

The passengers ate with the officers in the officers' saloon. The service was adequate—one waiter for nine passengers—and the food was the sort known as "good, plain cooking." This can as easily be "bad, plain cooking" but in the *Shipper* it was good. The chef was no *Cordon Bleu* but he had a decent respect for good raw materials and prepared them accordingly. There was usually a choice of three entrées and two desserts; I believe that anyone but a gourmet would have been happy with it. Dutch, German, and Scandinavian freighters have a reputation for setting a better table than do our ships. In some cases this reputation may be justified—but I enjoyed the food in the *Gulf Shipper.*

What you do between meals is up to you. You can sunbathe in a deck chair and count the flying fish, sleep, chat with the other passengers and the officers, read, play cards, study, or even get drunk. Or you can hole up in your room and wish to heaven that you had never left Paducah.

Ticky and I found the three weeks in the *Shipper* one long, gay picnic, its only drawback being that we ran very short on sleep. Both of us had expected to work and study on this leg of the trip; neither of us got anything of the sort done. But I am forced to admit that, aside from a couple of good parties in port, nothing noteworthy happened. We played cribbage, we yarned endlessly, and we had cheerful drinks with cheerful companions. Someone else might have found the trip excruciatingly dull.

Freighter travel is not necessarily cheap. For the North Atlantic crossing freighter fare runs about the same as cabin class in the *Ile de France,* with first-class fare running considerably more and tourist class running considerably less. No direct comparison can be made between passenger ships and freighters on the run from New Orleans and Valparaiso as there are no passenger ships on this run. But it can be compared with air travel. First class one-way by air from New Orleans is now $529, air tourist class is $402, whereas the ocean freighter fare is $410, to which you can add $30 or $40 in tips.

Another way is to compare round-the-world fares:

President Lines tour ships: about $2600
Air First Class: $1720
Air Tourist: $1580

Ocean freighter travel—from $500 to about $2000: the catch being that the $500 bargain is almost impossible to get and you probably would not want it if you could get it. A more likely figure is something between $1400 and $2000, or a median cost almost exactly equal to air tourist fare and a top cost in excess of first-class air travel.

Of course air transport simply gets you there, room-and-board on the ground being your problem. A typical trip around the world by freighter or cargo liner might show thirty days in port, during which time you may sleep and eat in the ship. Equal accommodations might cost you $15 per day if you went by air—a very rough guess since cost-of-living and rates-of-exchange vary so widely. Nevertheless, from my own recent personal experience in hotel costs around the world, I estimate the value of freighter accommodations as American-plan hotel accommodations to be certainly not more than $450 for 30 days, i.e., you can buy as many days sightseeing around the world for about the same price whether you go by air or by freighter. If you do not insist on the foreign equivalent of a Hilton hotel, you may be able to do it by air for a few dollars less than by freighter—and *much* cheaper than you could do it by luxury ship.

This may be surprising—I know that it surprised me. Until I made a direct comparison, on paper and through experience, I had always assumed that air travel was comparatively expensive, that in general travel by water was fairly reasonable, and that ocean freighter travel was very inexpensive. While it may have been true once, it is not true now.

The rates for particular trips vary widely. As a rule of thumb you can now expect that first-class travel by air will cost about the same as first-class travel by ship or train and that ocean freighter travel will cost about as much as air tourist travel. But it still depends on where you want to go; New York to London is about $75 cheaper, class for class, on the water, whereas New York to Los Angeles is at least $100 more expensive by water.

It adds up to a matter of taste and convenience. If you like long, lazy days at sea and have time for an extended vacation, ocean travel and freighter travel in particular is a real bargain; if your time is limited and you want a maximum of sightseeing for your dollar, go by air. If you can spare a month, you can go all the way around the world, see as much in as many days of sightseeing as are offered in luxury cruises of three or four months, all for the price of a Chevrolet. (A luxury ocean cruise, counting in tips and extras, will cost as much as a Cadillac.)

But freighter life unquestionably offers the maximum opportunity to rest. When we left Colorado Springs I was in a state of jumpy nerves from overwork. I twitched in the daytime and had insomnia at night. After a few days in the *Gulf Shipper* I was as relaxed as an oyster. It took me five days to work up enough ambition to load my camera.

After some days of sleeping all night, all afternoon, and napping in the morning I did bestir myself enough to poke around the ship a little. The *Shipper* is a typical freighter of the type known as "C-2." Her gross registered tonnage is 10,700 but, loaded, she actually displaces 15,000 long tons of sea water, i.e., that is what she would weigh, loaded with cargo and ready for sea, if you weighed her on your bathroom scales—I am speaking of largish bathroom scales, of course.

The term "tonnage" is used glibly with respect to ships by travel agents, seafaring men, and landlubbers, but the word is as slippery as "democracy" or "love" unless defined each time it is used. The ton referred to is a "metric ton" which the dictionary says is 2204.62 pounds—which is right as far as it goes. But it can also mean space of 100 cubic feet, or a carrying capacity of 40 cubic feet, or 35 cubic feet of sea water which is 2240 pounds in weight. It *never* means 2000 pounds as in a ton of coal delivered to your house.

To add to the confusion any ship has at least four usual "tonnages"—gross registered, net registered, dead weight, and displacement. The first two are measured in cubic feet, the second two are measured in pounds. In speaking of the *Queen Mary,* the *Nieuw Amsterdam,* or any merchant ship, the term "tonnage" that you are likely to hear means "registered gross tonnage" which is a cubic measure of the space enclosed inside her skin. On the other hand "tonnage" of a warship almost always means how much she *weighs,* ready for action. The two scales have the barest nodding acquaintance.

In the case of the *Shipper* her "net" tonnage is less than one third of her "displaced" tonnage, but both are correctly her "tonnage."

(John "loves" Mary; John "loves" bowling—see what I mean?)

Let us call the *Shipper* an 11,000-ton ship on the same scale under which the *Queen Mary* is called an 80,000-ton ship, by the cubic footage inside their skins. This does not mean that the *Shipper* is small; it means that the *Queen Mary* is fantastically large. A "little" ship like the *Gulf Shipper* can carry as much as two to three ordinary freight trains. She is 460 feet long, 63 feet wide, and draws 32 feet. To push this bulk through the water at 15.5 knots (18 land miles per hour) she uses 6000 horsepower derived from oil-fired boilers and steam-driven turbines—the locomotives used by the Santa Fe's famous *SuperChief* are rated at 900 horsepower; on the other hand the lovely lady *Lexington,* lost in the battle of the Coral Sea, had a rated horsepower of 180,000 and could, by tucking up her skirts a bit, turn up over 200,000 horsepower.

The *Gulf Shipper* carries a crew of forty-seven, seventeen in deck and navigation, seventeen in engineering, thirteen others including the purser, radio operator, chief steward, cooks, waiters, and helpers. Twenty-four of the crew are deck and engineering watchstanders, eight to each of the three watches. The others are either those whose duties never end, such as the Captain, the chief engineer, the purser, or those who work at specified hours, such as cooks and deck maintenance men. The ship's payroll will run around $20,000 a month and the total cost of operating her is about $85,000 a month—which means that she has to run fully loaded most of the time, make fast turn arounds, and avoid excessive overtime in order to show a profit.

American merchant ships are in a poor position to compete with foreign shipping. The ship itself costs more, our safety laws are more stringent than those of many of our competitors, and we pay enormously higher wages. I am not criticizing the wage scale; it is simply what must be paid to persuade Americans to go to sea instead of taking jobs ashore—but it is true that we pay as much to an able seaman as many countries pay the captain of a large vessel.

Because of our high costs many American vessels are being transferred to foreign flags under whose laws they can operate at much lower costs. This flight from the American flag would perhaps be of only sentimental importance were it not usually agreed that a large and healthy merchant marine is an essential part of our national defense. A quick answer is to hit the taxpayers for a shipping subsidy. Another quick answer is "American ingenuity and enterprise." A third quick answer is that merchant shipping is no longer a major factor in war because the next war will be settled from the air in a matter of hours or days.

I am sorry to say that I seem to have mislaid the right answer.

The *Gulf Shipper* arrived off the Atlantic end of the Panama Canal early Saturday morning the 21st, stopped just long enough to pick up the pilot and his handling crew and to drop the purser, then started through the Canal. Passengers could, if they wished, get off with the purser, spend the day shopping and sightseeing, travel across the Isthmus by bus, and join the ship that evening on the Pacific side.

None of us did so. Ticky had never seen the Canal before, but neither had she ever seen Colon and Panama City and the U.S. settlements, Cristobal and Balboa, adjacent to them. She was torn between the desire to see the first foreign port in our trip and a desire to see the Canal; I persuaded her to see the Canal.

I swear on a stack of wheat cakes that I was not motivated by a desire to keep her away from the bazaars. It is true that the shops of Colon and of Panama City have an effect on all women and some men much like that of a bed of fresh catnip on a cat—and the bargains often are real bargains, for Panama City is a free port. No, like a total eclipse of the sun, the experience of transiting the Panama Canal is one that should not be missed if available. There is nothing else like, it in the world . . . and I am not forgetting the Suez Canal.

I still have scars on my arms from sunburn acquired more than a quarter of a century ago when I first went through the big ditch. I knew at the time that I was getting sunburned but I could not bring myself to stop looking and go below. Since then I have seen it many times—and I still can't stop looking.

Any atlas, world almanac, or encyclopedia will provide a winter's supply of sound, chewy facts about the Panama Canal, tonnages, tolls collected, yards of earth moved, and so forth. They are well worth reading but we will not repeat them here. The Canal was started by the French in 1882; you can still see the old French Canal slicing slaunchwise into the channel we cut. Yellow fever and more bad luck than any man ought to have put a stop to the French attempt. We bought the franchise and, with almost indecent haste, recognized a Panamanian revolutionary government which seceded from Colombia in 1903, signed a treaty with the new government and started work again in 1904. Ten years later the first ship went through.

The Canal is fifty miles long and runs northwest to southeast across the twisted isthmus in such a fashion that the trip from the Atlantic to the Pacific (i.e., to the *west)* winds up twenty-seven miles farther to the *east.* This has to be seen on a map to be understood; it is as silly as the fact that Los Angeles is east of Reno. Sea level is a couple of feet higher on the Pacific side than on the Atlantic side but this odd fact is swallowed up by the fact that the major portion of the Canal is eighty-five feet higher than either ocean. Three sets of locks at each end perform the improbable task of lifting and lowering ships of fifty thousand tons or more the height of an eight-story building.

There has been a lot of agitation for a sea-level canal, through Nicaragua or elsewhere. One glance at any one of the locks of the

Panama Canal is enough to show why; one pony-sized A-bomb anywhere near one of the locks would put the entire Canal out of use for months or years and leave our navy and merchant marine with a nice, long, chilly trip around the Horn in order to get from one coast to the other. You will correctly assume that the Canal Zone contains antiaircraft and radar installations—but the bomb need not be delivered by air; it can be in the hold of a ship flying the flag of Ruritania, or even the U.S. flag. There are more than seven thousand ships going through the Canal each year and the only known way to inspect a ship for A-bombs is to unload everything, take a screwdriver and open every crate . . . a process equivalent in itself to closing the Canal to traffic.

I am disclosing no secrets. You may be sure that Mr. Malenkov's assistants have given thoughtful consideration to these matters and that our government has been equally thoughtful. If I knew of an answer I would be in Washington right now.

In the meantime the locks of the Panama Canal remain the most satisfying gadgets I have experienced since the time Santa Claus brought me a toy steam shovel that actually worked. The ship slides slowly and quietly into the first of the Atlantic side or Gatlin Locks, towed into place by miniature cog railway engines known as electric mules. The gates close ponderously and magically behind her, untouched by human hands; a guard chain rises to protect the gates. The ship is enclosed in a box; all one can see is the concrete walls.

Water boils up from the bottom of the lock and high, high up she rises! The ship lifts gradually up and up until the sightseers on her decks can again see over the sides of the lock the tailored, tropical surroundings. The gates ahead open, again by magic, and the ship is gently urged into the channel ahead. Three times the ship goes through a water elevator, lifted each time about thirty feet, then she is let free into Gatlin Lake.

The lake was made by damming the Chagres River, which supplies the water to work the locks. Here and there, outside the dredged channel, dead trunks of trees still thrust up through the water, melancholy monuments to progress. The extremely broken shore line and the numerous islets, both characteristic of newly-flooded river valleys, form and re-form deep three-dimensional vistas, all in glorious Technicolor. The place seems unreal, as if one had fallen into a Disney musical.

I have heard it said that Gatlin Lake is the "dull" part of the Panama Canal. I don't know what to say to such people. They are unquestionably right, since it is all a matter of taste, as the old lady said when she kissed the pig. I once ran across a woman from France who had just finished a tour of the western part of the United States.

In her opinion she had seen nothing west of the Mississippi worth looking at—including the Grand Canyon, the Rocky Mountains, Yellowstone, and so forth. As the booking agent said to the man who was flying by flapping his arms: "So you can imitate birds. But what can you do that's *novel?"*

You may not share my enthusiasm for Gatlin Lake and, after all, it is just another lake. The whole world is loaded with beautiful scenery; Gatlin Lake is one of thousands. But I have been in it at every time of day and in every season and I myself have never grown bored with it. The lights and colors are always changing; the motion of the ship combines with the twisted shore lines to form backdrop after backdrop into mysterious depths. Perhaps it is "dull"—but I am a Missouri country boy with black mud between my toes; I still stare at the Empire State Building whenever I get a chance.

The entire experience of the Panama Canal has always seemed pleasantly unreal to me, as if it all had been constructed by a Hollywood miniature set designer—the blazing sunlight, the quick rain storms, the little electric engines crawling slowly up beautifully curving concrete walls, the locks themselves and the lavish engineering structures around them, the endlessly changing depth on depth of lake and cut and jungle. It was designed more than half a century ago, back when ladies had "limbs" and the shout of "Get a horse!" at an "automobilist" was real wit. Yet it looks like a set for a major production scene in a Hollywood fantasy of the future.

After the lake the ship enters the Cut—"Gaillard Cut" on the maps, "Culebra Cut" in the mouths of most people. This is the part that almost broke the hearts of the builders. This is where hairy engineers in field boots stared through surveying instruments at mountains and decreed that they must be moved. Moved they were—by coal-burning steam shovel and scraper and mule and muscle and sweat. The Model-T Ford was brand new then and the bulldozer was yet to be born. Earthmoving machinery such as any county road department now owns would have seemed miraculous; they made do without.

The banks are very close here and the jungle is almost in your lap. You sit in a deck chair or lean on the rail and let it flow past you, birds and snakes and waterfalls and giant blue butterflies. Once, some years ago, I found myself staring back at an eight-foot alligator, so close that I could see the stains on his teeth. I alert Ticky to watch for them, but we have no luck. One of the pilot crew aboard tells me that there are plenty of them still on the shores of the lake and that it has been necessary to fine people who hunt them for sport, then leave the carcasses to rot in the clean water of the lake.

Back in the jungle here, only shouting distance away in places, is the old Gold Trail, peopled with the ghosts of the Indian slaves who died on the way. Once, twenty years earlier, I rode along a portion of it on a borrowed army horse. It was paved with stone and the jungle had not quite destroyed it, but had arched over it instead, forming a dusky tunnel, a place of enormous butterflies and midget deer and silence. The Isthmus was one of the world's major roadways long before the water bridge was cut through it.

But nowadays the once-heartbreaking journey is soft and easy and no one dies on the way. Traffic lights control the shipping through the Cut, real traffic lights with red for stop and green for go. There are places where the pilot must hold back and give the traffic ahead a chance to clear; the lights tell him, just like those on Wilshire Boulevard. In addition to lights he has been briefed by the control officials ashore as to what ships to expect and where, since the enormous mass of a ship is not stopped by jamming a foot on a brake. The handling of a ship through the Canal is a piece of precision choreography. There are ranges, each a pair of giant targets, at dozens of places along the route; the pilot can sight along one range and know that he is lined up properly for the channel and sight along another at the same time and know to the yard just how far he has progressed along that reach of the channel and how soon he must turn.

The reason for such precision is evident: in some places ships pass so closely that you expect their plates to scrape. Canal pilot is among the most highly skilled jobs in the Zone and is highly paid by civil service standards. But the job is done without swank. Almost all other countries dress their pilots in uniforms like those of naval officers, but the *Gulf Shipper's* pilot was a young man in a slouch hat and casual sports clothes who carried his responsibilities with the relaxed ease of a truck driver.

We passed through Pedro Miguel and Miraflores Locks in the late afternoon, with the same processes as in Gatlin Locks save that we started each time high above the scenery, then sank into claustrophobic depths before being let out into a lower level. At dusk we dropped the pilot and steamed out into the waters of the Pacific, into the Gulf of Panama, with the lights of Panama City on our port hand. We picked our way through islands and submerged rocks and presently Captain Lee set course for Point Charambird above Buenaventura, Colombia.

A drastic change comes over a ship as soon as it touches dock. The physical change can be easily described but the emotional change is far greater and harder to convey. For some days you have been in a little world, an enclave away from atom bombs and strikes and bills and auto accidents and traffic noises and strange people. Nothing is real but the ship and it is a place of no worries. You leave your stateroom door wide open, leave binoculars or cameras on deck chairs, dress as you please. No one hurries and no one worries. You are home, with only your "family" around you.

Then the gangway touches the dock and all is changed completely, with the suddenness of being dumped out of warm sleep into cold water. Strangers swarm aboard, they are everywhere and they all look like criminals. A percentage of them are indeed petty thieves who will steal the socks off your feet without untying your shoe laces; this is true in any port including those of the United States. You always lock your stateroom door and carry the key with you everywhere. You dog down the ports of your room if you step out even for a moment, no matter how hot it is, as even a moment is enough for the waterfront pilferer; fly screens won't stop him, it takes steel. Nor are you safe simply because your porthole does not face onto a gallery; harbor thieves have been known to operate from the masts of small boats, using a gadget combining the features of lazy tongs and fishing rods.

You return to your stateroom—locked, thank heaven!—and find a villainous-looking stranger trying the door. Unabashed, he claims to have been looking for the purser. Perhaps he was and perhaps he has legitimate business with the purser. Perhaps stealing is only a hobby with him. You don't find out, as the purser is much too busy to talk with you. The Captain, a genial host only an hour before, brushes past you without seeing you, two strangers in tow. You return to your room, bolting the door behind you, and start to change clothes. Then you notice faces at each porthole. They weren't there ten seconds before and the gallery was empty as you came in.

Buenaventura, Colombia, is not worse than other ports; for pure villainy it is not in the same league with the racket-infested docksides of New York City. In fact, the purser tells us that Buenaventura is safer than it used to be, as "the officials are no longer hungry." About six months earlier there was a revolution, or rather a military coup d'etat; since then the port officials and the police have been paid regularly. They do not need to steal nor to seek bribes in order to eat.

The notion that a military dictator can produce a better government than an elected regime is obnoxious, but clearly this is an occasion for suspended judgment. Our Latin neighbors move in mysterious ways. Where we would use a recall or simply wait for the next general election, they wake *el presidente* up in the middle of the night, stick a gun in his face and tell him that he is through . . . they hardly ever kill him.

I find it necessary to remind myself firmly that the customs of my own tribe are not the laws of nature.

The stevedores all come aboard carrying empty sacks; when they leave the sacks are not empty. The sacks may contain U.S. cigarettes purchased from crew members and destined for black market ashore, or they may contain anything that is not riveted down. The chief mate tells us that he has found them taking away crumpled pieces of old newspaper—trash used in stowing cargo and left in the holds. Or they will gather up a few coffee beans left on the floor plates. These people are poor; to them anything is worth salvaging.

It was raining when we reached Buenaventura. During the two days we were there the rain stopped once for about two hours. Buenaventura enjoys, or suffers, three hundred and fifty inches of rain a year or about an inch a day. A freighter skipper hates to rig cargo awnings as it slows up the work greatly and cuts into the slim margin of profit, but in Buenaventura it is done as a matter of course. Much of the cargo loaded there is coffee; to allow it to get wet is financial disaster.

Colombian coffee is precious stuff, much prized for blending. A prime reason why it is almost impossible to get a decent cup of coffee (by American taste) anywhere but the United States is that coffee made elsewhere is likely to be Brazilian coffee, strong and bitter. We use the hearty Brazilian coffee, too, but we blend it with milder coffees of vastly different flavor from the highlands of Costa Rica and from Colombia. The purest water, used with great care in Silex or drip pot, will not produce an "American" cup of coffee if our American blends are not used.

Most of our tonnage for Buenaventura was a couple of dozen big motor buses, carried on deck and in the upper holds. Rain would not hurt them and there was no need to rig tarpaulins until they were out of the way, but rain could and did slow up the work and make stevedores and crew miserable. It was hot, tropical rain. We slept naked on sheets with blowers playing on us full blast, and we soaked the sheets. I used three shirts a day in a hopeless attempt to be neat and the neckties I did not wear nevertheless mildewed on their hooks. Towels never dried, clothing was damp when it was put on, my typewriter rusted to immobility, and I broke out with a superior grade of athlete's foot.

Ticky looked at me with quiet reproach and said, "I thought you told me you *liked* the tropics."

The rain slacked off and the sky almost cleared the middle of the next morning and Ticky and I, Vi and Bob Markham, went ashore. Buenaventura is a very busy port, serving all the west slope of Colombia, but it is a small town, about 14,000. It looks like any number of other small towns through Central America and is rather pretty when the sun is shining. It has a onesided main street, a hotel, a Catholic church, several cantinas, and a few shops where the rush of trade is slowed down to a tranquil hush. Once you are off the docks and through the customs gate there is little danger of being run down by the traffic, nor are the sidewalks crowded. One swarthy fellow, perfect type casting for the assistant villain in a tropical melodrama, followed us around the whole time we were ashore, but he never attempted to speak to us. Apparently he just wanted to look at the gringos.

We exhausted the sightseeing resources of the town in an hour and had exhausted ourselves in the heat and humidity even at a very slow walk. It was beginning to rain again; we returned to the ship.

I was assured by several members of the ship's company that Buenaventura might be sleepy in the daytime but that it possessed a very rugged night life "up on the hill" with music and liquor and entertainment downstairs and anything at all that one cared to pay for upstairs. I thanked them and let it go at that, saying that I had a date to play cribbage.

The cribbage game never came off because the chief engineer took advantage of our stay in port to give a cocktail party, announced as a meeting of the D.M. Club to induct four new members: the Heinleins and the Markhams. "D.M." stands for "Dry Martini." It also stands for "Dead Man," and is an intentional play on words. The chief engineer made excellent dry martinis; regrettably he served them in water tumblers. I do not have the constitution to play "al seco" or "bottoms up" with martinis of that size and I refused to do so, even though repeatedly urged—nevertheless the drunker I stayed there the longer I got.

I was saved by the dinner bell. We all piled into the dining saloon and started wolfing comestibles. I needed same.

A careful reconstruction of what happened next seems to establish clearly that Ticky fired the first shot. The Captain was sitting across the room from her and failed to answer when she called out something to him. Ticky is not a woman to be ignored with impunity; she wadded up her napkin and let him have it. The first salvo was short and landed in his soup.

For several days we had had bowls of kumquats on the table. The kumquat is a very pretty fruit and makes excellent preserves but they are not much to eat raw. I never saw anyone eat one and I think the waiters simply dusted them off and brought them back, meal after meal.

But they are a nice size for throwing and have excellent ballistics properties in the medium ranges. Very soon the air was filled with kumquats. Each kumquat could be used over and over again (and was) until it got tired and burst, which it did. As the kumquat supply diminished, other things were pressed into emergency service, rolls, more wadded napkins, anything that came to hand. I was very hungry and did not take full part in the festivities, limiting myself to grabbing anything that landed near me or on me and firing it back blindly over my shoulder. There being a solid rank of ship's officers behind me, I stood a good chance of getting the junior third or the mate even if I missed the skipper or the engineer. So I kept on eating.

The officers' waiter, a young Cuban called "Chico," entered into the spirit of the occasion and started running ammunition in from the pantry to the Captain's table, starting with more kumquats and branching out when they ran short. He came in at last with a large platter covered with cold cuts, which was intended for midnight lunch. He offered it proudly to Captain Lee.

The Captain looked at it, grinned, and reached for it—then demonstrated the qualities of leadership, mature judgment, and restraint that had carried him to the top: he firmly refused it and made Chico take it back, much to Chico's disappointment. This act of renunciation turned the tide; a few more desultory salvos and the battle was over.

Bob Markham told me afterwards that the finest moment of the engagement known from then on as "Kumquat May"—a poor pun but it was awfully hot—was an incident that I did not actually see because I was in it. Someone hit me fair in the back of the neck with an entire plateful of tossed green salad, well marinated, and I did not flinch nor cry aloud but kept on eating. Markham seemed to feel that it showed rare aplomb.

I gave him the aw-shucks-fellers-it-warn't-nothing-anybody-else-with-courage-and-a-coolhead-would-have-done-as -well routine. The fact was that I wanted my dessert. It was a plain one-egg cake with icing which I prefer to most fancy desserts; I was durned if I was going to miss finishing my dinner simply because lettuce was dripping from my ears. Once I finished the cake I gathered up everything that I could reach and threw it at the Captain in one saturation barrage. I was not sure that he had thrown the salad at me but I believe in the sound and ancient principle that the commanding officer is responsible for everything that happens in his ship.

I must say that Captain Lee looks well in chutney.

After dinner someone again suggested that we all go ashore and try the entertainment offered up on the hill. Ticky was willing but I vetoed it and was supported by Bob Markham. No doubt a solid phalanx of ship's officers, ably led by the Paul Bunyan figure of the Captain, would have supported us in any difficulty—but I do not trust remote tropical seaports after dark; I have seen too many of them as a young bachelor. The guardia is never around when you need it and a surprising number of the citizens carry knives. We went to bed instead. It was clear for almost an hour the next day when we steamed out. Buenaventura is located in a very beautiful estuary which would no doubt be still more beautiful if the clouds would clear away and give a view of the snowcapped Andes only a few miles beyond. I had looked forward to seeing the Andes here, for it was through these mountains that Simon Bolivar the Liberator, a man half devil and half saint, had dragged his consumption-racked body to lead his starved and ragged army on to victory and freedom.

But I had to be content with a view of the harbor and the surrounding jungle. Colombia, although a country of Spanish and Indian tradition and culture, has a major strain of Negro. Accompanying us out into the stream were many dugout canoes paddled by blacks and on the shore we could see grass huts appropriate to Africa but which looked decidedly out of place in South America. Most of the Negroes here are supposed to be descendants of slaves escaped from farther north and who made their way through jungle and along the shore to freedom. It seems plausible, for it looks as if Congo culture had been preserved almost unchanged here through the centuries, only a few miles outside a town having most of the hallmarks of modern Western culture.

The *Gulf Shipper* turned south and soon entered the Humboldt Current, which sweeps north along the coast all the way from Antarctica. The weather turned chilly and we crossed the equator under two blankets—after sweltering in our bare skins only a few miles to the north.

Three days later the *Shipper* stood into the harbor of Callao, Peru, the seaport of Lima, the capital. The metropolitan district of Lima contains more than a million people and is a good place for a gringo to start getting over the notion that South America is an uncivilized back country. True, South America is thinly settled compared with the United States and it still has ahead of it perhaps a century of frontier exploitation whereas our frontier has moved on up into Canada. But Lima is both one of the oldest and in some ways the newest city in the Western world.

As a Western city it dates back to 1530, Pizarro's conquest, ninety years before the Pilgrims landed at Plymouth Rock; its origin as an Indian city is lost in antiquity. Its university is the oldest in the Americas. But in new Lima are mile after mile of homes in the style called "modern" and which perhaps should be called ultramodern, since nowhere in the United States can there be found modern architecture to compare with these in abundance, in lavish use of color and glass, and imaginative freedom of design. Admirers of Frank Lloyd Wright, of Schindler, and of Neutra, if suddenly plopped down in new Lima, would probably conclude that they had died and gone to heaven.

The ship docked late in the day; it was early evening before we could leave—five of us, Ticky and I, the Markhams, and Mr. Tupper, the honorary "cruise director." Captain Lee had intended to come with us but business with the company agent held him up; he asked us to meet him at the Gran Hotel Bolivar at seven-thirty.

We drove the seven miles from the port to Lima along the beautiful Pan-American Boulevard. The countryside, vegetation, and buildings looked to me much like many places in Southern California, except that the Coca-Cola signs read "bibo" instead of "drink." We could see the Andes from time to time, but not very impressively as they were obscured by the same high haze so common in Southern California. It looked to me as if it might be gathering in for a rain storm and I asked the driver about it. He said that he did not think so, as it had not rained for thirty years.

He was not pulling my leg. All of the water in Lima is brought down from the mountains; there are grown men there who have never seen rain. The incredible change from the never-ending inch of rain per day of Buenaventura to the endless years of no rain at all in Lima only a short stretch of coast to the south is accounted for, so they tell me, by the ocean currents; the cold Humboldt Current laps Peru while the hot Counter-Equatorial Current runs straight into Colombia. We passed through cuts in hills which had a faintly artificial look to them, being composed mostly of thousands of little boulders, polished smooth to the size of grapefruit. The artificial look was justified; they were Indian burial mounds. Here and there one could see a thigh bone sticking out, or ribs, and sometimes a boulder turned out to be a skull. Indian families had huts here and there among the partly destroyed mounds and babies played among the bones of their ancestors. The taxi driver let us out in the Plaza de Armas in downtown Lima and charged us twenty sols or one Yankee dollar, seven miles for five people. The present rate of exchange is very favorable to us *norteamericanos* and it does not seem quite fair. We strolled around the plaza for a while, an impressively beautiful place, then sought out the Hotel Bolivar—with a couple of narrow squeaks from traffic. Lima has excellent traffic cops who handle the extremely dense traffic efficiently and with rare dignity—their stylized gestures remind me of a Balinese dance in slow motion. But the signals they use are not the signals our traffic cops use and every Latin American drives with courage. He understands the decidedly different driving customs of his country and he expects pedestrians to understand them also. Getting from curb to curb without any *intention* of jaywalking can be a hairraising experience. By the time we reached the Grand Hotel Bolivar I was glad to seek out the bar and have a tonic for my nerves.

Under the favorable exchange martinis cost about nine cents and a pisco sour cost six cents. The pisco sour occupies in west coast South American diet the position that vitamin tablets do in ours. Pisco is a native brandy. No proof is ever shown on the bottle but it is certainly higher in alcoholic content than is whiskey in the States. I estimate that it could stand up to vodka and give away the first two punches. I tried one pisco sour and shifted back to martinis, where I knew the territory. At the Bolivar we gathered in the purser and the second engineer and a flier from Texas and a big gringo mining operator. When the Captain arrived with a company agent, Vi and Ticky had nine men to split up between them. But the wolves in Lima are gallant, aggressive, and optimistic; Ticky complained to me presently that a stranger present was trying to pick her up. "Every time I look up he lifts his glass to me and motions with his head for me to come over," she said indignantly.

I suggested that if she refrained from looking at him she would not know that he was looking at her. But she continued to simmer. Presently she and Vi left us to find the powder room. When she returned she again had something on her mind. "This place is impossible!"

"Why? It reminds me of the Bellevue-Stratford in Philly. Seems like a pretty nice joint."

"Hmmph! Vi and I just walked through the lobby, minding our own business. At least a dozen men tried to pick us up."

"Well! Congratulations."

"It wasn't funny."

I tried to explain to her that customs varied and that any woman without an escort right at her elbow was assumed to be open to suggestions until proved otherwise. But her attention had flitted elsewhere. "Bob, there was a little Indian girl in the powder room, the maid, the attendant. I didn't have any change and Vi didn't either, so we turned out the bottoms of our purses—"

"Strike oil? Any mousetraps?"

"Don't be funny. I found a nickel and two pennies and gave them to her, feeling apologetic. But she seemed pleased and started talking excitedly and hurried away and came back and showed us what *she* had. It was an American quarter and she had shined it up like silverware. It was rather pathetic. Give me some change, dear. I want to go back and tip her properly."

"All right. But let's figure it out. You tipped her seven cents. That's one sol forty, or the price of a cocktail. Back home, would you tip a washroom attendant seventy-five cents?"

"Why, no, I'd probably tip her a quarter."

"Then did you under-tip? Or overtip?"

Neither one of us could figure it out. It was our first tangle with a problem which worried us all around the world: whom to tip, when to tip, and how much? How to hold up the American reputation for generosity without adding to the American reputation for being blatant and wasteful suckers? We never did work out a satisfactory formula.

The entire party decided to move on to the "Club 91" for dinner, at which point I attempted to put into operation a previously prepared plan. It had long been established that Captain Lee was the world's worst check-snitcher; it was almost impossible to buy the man a drink because he would make a long arm, grab the check, and push aside anyone who attempted to pay it.

Knowing this, we party of passengers had planned for it and I had been selected to carry it out. I started with a verbal barrage in which I informed Captain Lee that we had taken a vote and decided to stick him with the check. I was very firm about it and he was very hurt, protesting that he did not mind paying his share but he thought it was a hell of a note for the rest of us to decide to clip him—he wouldn't stand for it, no, sir.

While his attention was diverted, I had obtained the check; I handed the waiter our pooled funds.

Captain Lee caught the tail end of the maneuver. With a scream of rage and a fist full of sols he straightened up to his full seven feet and attempted to reverse the matter. I got off with a slight flesh wound, but we kept him from paying the check.

On the way to dinner he kept trying to force money on me. After a while he quit but he seemed pleased about something. Later on Mr. Tupper twitted him about losing, whereupon he said, "Oh yes? Bob, look under your coat collar."

I did so, but there was nothing there. It developed that the Captain had tucked a roll of bills, two hundred sols, under my coat collar while we were crowded into a taxi—but they were gone, had fallen out. We speculated about the expression and feeling of the taxi driver or whoever it might be that found it, then forgot it, with each side feeling that it had won a moral victory.

But the next time I try to snatch a check from Captain Lee I'll wear gloves.

Club 91 is 'on the top floor of a skyscraper and has a feeling much like the Top o' the Mark, with broad expanses of glass giving a panorama of the wide-flung city, the Andes, and the ocean. It is very posh and has wonderful food, an exotic cuisine in no way resembling Mexican food. Nor is it international-French cooking, it is Peruvian. I don't know what else to say about it; describing dishes and flavors which are truly novel is a waste of words. But when you go to Peru, don't limit yourself to steak; there are delightful surprises in store for you. Leave room for dessert, too. They bring them around on an oversize tea wagon and let you pick by sight instead of from a menu. I don't know whether this is a kindness or not, since by that time you cannot possibly toy with more than one and the others are lost to you forever.

Dinner in South America is not the evening meal; it is a nighttime adventure. Although we went straight back to the ship it was very late when we got aboard and I rolled into my bunk, happy with the thought that the ship was sailing and I could sleep all day tomorrow.

But I learned at seven A.M. that the ship was not sailing, that loading had not been completed, and that the Captain had ordered a taxi and a guide for us. I groaned, took Dexedrine, and decided to enjoy it, reminding myself that I had come a long way and had spent more than fifty cents for the privilege.

Our guide and driver was Senor Rodolfo Gonzales Bueno, a middle-aged Indian of great size and great dignity. Perhaps his ancestry was more Spanish than Indian; if so, the Indians came out ahead. His face reminded me of that carved stone god that stares with timeless majesty out over the water gardens in the grounds of the Pan-American Building in Washington, D.C.

We made a full day of it and I was soon glad that the ship had not sailed even though my head was beginning to ache. We saw Callao first, the harbor, the naval academy, and an enormous market made up of hundreds of little stalls, crowded and colorful. I took the precaution here of leaving Ticky's purse with Mr. Gonzales as I was not anxious to start too quickly the business of dragging plunder around the world.

Then we saw old Lima, university, government buildings, presidential palace, archbishop's palace, cathedral, all impressive and all ornate in a style no longer popular. There were so many of them that I almost felt sympathy for the tourist who came charging up the steps of our own National Capitol at Washington and said to his wife, "Okay, Marge, you take the inside and I'll take the outside and we ought to be through in twenty minutes."

But in the cathedral we saw the mummy of Pizarro the Conqueror himself. There he was, in a glass coffin, a little man who could not have been very impressive alive and who must have looked like a child to the giant Inca gods. Yet he and his "thirteen friends" by treachery and deceit and casual murder brought the mighty Inca Empire to ruin.

Now he lies with sunken eyesockets staring sightlessly up, his shriveled, darkened flesh and untidy hair on display, a sight for any tourist with two-bits to tip the attendant monk to let them stare.

"Ozymandias, King of Kings—" Was it worth it, pal? Are you happy now? Or are you groaning in hell for your crimes?

Odd though it seems, although his bloody record is well known and although most of the citizens of Peru are descended from the conquered rather than the conquerors, Pizarro seems to be a popular hero.

I asked to be shown slums. This was not morbid curiosity. All countries have the homes of the rich, whether they be commissars, counts, or capitalists; their homes are all beautiful, they look pretty much alike everywhere, allowing for climate and architectural styling, and you learn very little about a country from seeing them. I always look at them for the enjoyment of seeing beautiful things, but you learn more from the slums, which are not enjoyable to see.

Lima had both shanty town slums and formal, tenement slums. The shanty towns were true international architecture, the grim and pathetic structures built by people who have nothing at all and must shelter themselves with scraps and other people's junk. They were indistinguishable from the shacks of Okies in Imperial Valley twenty years ago, from the barrios of Rio, from the shanties of Singapore's waterfront. The formal tenements were mostly one-story buildings built wall to wall in long rows with narrow alleys. They reminded me of dog kennels and were even more depressing than the much less adequate shanties, for here poverty seemed static and hopeless, a permanent way of life.

Almost next door to these warrens was a palace. It had once been a private home but now belonged to the government and was used by the army. Many of the soldiers' families lived in the nearby tenements; the contrast was sharp and bitter for papa worked in (literal) marble halls, then went home when off duty to a house more suitable for pigs than for women and children.

The palace had been built by a marquis for his "beloved"— a polite Latin expression which concedes the permanence of marriage but admits that love is something else and important in its own way. The social custom of the mistress as a formal institution in Latin America is very disconcerting to *norteamericanos,* reared in a matriarchy. Except for a very few cases, mostly in Hollywood and New York, there is no group or social class in the United States parallel to what is meant by "mistress" in Latin America, and even the exceptions are not truly parallel, for a kept woman does not have the publicly recognized, customary status of a Latin mistress.

When we use the word "mistress"—which is seldom—the reference is often in the past tense and means simply that Mr. and Mrs. Jones had their honeymoon before they held their wedding, a circumstance often factual but usually known publicly only through gossip and conjecture, or known statistically through Dr. Kinsey's tedious tables. Or "mistress" may refer to an informal biological arrangement carefully concealed and usually without any specific financial arrangements for support. Neither of these cases parallels the Latin custom. A Latin American who has a mistress usually has a wife as well and will appear in public with either one of them, but not both.

Each woman has a recognized place in his life and their social spheres ordinarily do not overlap.

But a mistress is not something to hide away in a back street. Her status is limited but much more privileged than is easy for a gringo to comprehend. Some years ago in a South American capital the United States ambassador gave a big party and invited all the local heavyweights and their wives. They came but most of them brought their mistresses.

The ambassador's wife was insulted and the ambassador was outraged and it almost resulted in an open international incident. Yet the mix-up was clearly a failure to understand each other's customs, since no South American would intentionally offend his host and hostess. The word should have been passed around quietly that this party was not intended to be fun; it was simply meant to be attended ritualistically—with *wives.*

The marquis' "beloved" (I don't remember either of their names and it does not matter) was apparently a woman of spirit who did not accept easily the limitations of her status. She was part Indian and from the lower classes; instead of being a well-behaved and modest mistress, respectful to her "betters," she refused to play the game according to the rules they handed her. Whether or not she objected to polygamy in itself is not known, but she certainly objected to the subordinate status accorded her by custom. She went out of her way to flaunt her birth and background under the quivering noses of the Castilian aristocracy of Lima. But her marquis refused to knuckle under to social pressure, but hung on to her, even though she was obviously "impossible" in the minds of all "right thinking" people.

He certainly did well by her. The Peruvian government, although using much of the palace for military purposes, has preserved the grounds and gardens and has maintained many of the chambers as a museum of the splendors of a by-gone day. Among other things, there is a carved marble bathtub on one of the balconies, of Imperial Roman magnificence. No one seems to know now if that was its usual position; the climate of Lima is balmy enough to have permitted her to bathe outdoors if such was her whim, and the tub would be very difficult to move. In any case there is a small swimming pool in the middle of the garden and a small summer house next to it which has a slatted screen like a venetian blind through which the pool can be seen. The old marquis is reputed to have been a bit of a voyeur; this summer house is supposed to have been a vantage point from which he could peep at her while she was swimming. Why in Ned he did not simply pull a chair up to the edge of the pool, or better yet, pull off his duds and join her nobody knows. Maybe he got more fun out of peeking.

There is a marble bust of her in the garden. She was unquestionably a beauty, fit to occupy the palace he placed her in. Now it stands as an inspiration to all women that they, too, can live in a palace if only they will use the depilatories and deodorants advertised in all the best women's magazines.

We then drove through miles of magnificently gardened, ultramodern-style homes to the country club. We passed several of the embassies, among them the Colombian Embassy where Senor Victor Rail Haya de la Torre was at that time still a prisoner of asylum, and still was to be so for several months to come. Mr. Haya's story is well known through the newspapers and has been fully covered in his own words in *Life* magazine (3 May 1954); we will omit details, except as they throw light on the striking differences between political life as we know it and the brand practiced south of us. Mr. Haya is the leader of the APRA party of Peru, which is left of center but not communist. He was charged with attempting a coup d'etat against the government, but—and this is a South American twist hard for us to follow—the charge was brought against him by a later government, which had itself come to power by overthrowing the very government Haya was charged with attempting to overthrow.

The nuances of Peruvian politics are too complex for me and I doubt if any outsider could gain a real understanding of them without a long, hard apprenticeship. All of the nations south of us are constitutional republics with liberal constitutional safeguards similar or usually equivalent to those found in our own constitution, yet with the shining exceptions of Chile and Uruguay, their political records seem to us to be an endless list of coup d'etat, bloody revolution, unelected provisional presidents, political admirals and generals, states of siege, states of public emergency, exiles and refugees, outlawing of opposition parties, liquidation of opposition leaders, suppression of free speech, free assembly, and free press.

Here is a place to walk softly, to be not hasty in passing judgment; we may not understand all that we see. I found in traveling around the world that a great many people believed the most arrant nonsense about the United States. In particular, a great many people, apparently well educated and sophisticated, were convinced that the people of the United States were in the grip of terror and that free speech and free press no longer existed here. They believed that the United States was fomenting a third world war and would presently start it, with Armageddon consequences for everyone else, and that the government of the United States smashed without mercy anyone who dared to oppose even by oral protest this headlong rush toward disaster.

These people could "prove" their opinions by quoting any number of Americans and American newspapers and magazines. That they were able to quote such American sources proved just the opposite, namely that we *do* continue to enjoy free speech even to express arrant nonsense and unpopular opinion, escaped them completely.

The extremely wide scope of free speech and free press in the United States, much wider than that enjoyed anywhere else in the world including all of the British Commonwealth, is not understood elsewhere.

(More free speech and press than in the British Commonwealth? Surely not! Ah, but we *do* have: our radio is not government owned, we do not place severe restrictions on the importation of printed matter from outside our borders, our libel laws and our limitations on reporting of court procedures are as nothing compared with theirs, our news reporting is the most aggressive in the world.)

The real restrictions against what we can say or print are very nearly limited to only the most blatant of pornography and to classified military secrets. But citizens of other countries neither understand nor believe this; it is too foreign to their own experience: I said to a man in South Africa: "You insist that anyone in the United States who expresses an opinion favorable to Russia or to communism is immediately thrown in jail. How do you reconcile that with the fact that the communist *Daily Worker* is still published in New York?"

He simply called me a liar.

I thought of sending him a copy on my return, but I refrained; such a publication in *his* country was likely to cause him trouble if he was caught with it.

In most cases all around the world these discussions that revealed the extent of misconception about the United States and its institutions started at the same point: why didn't the United States government or the United States people or *somebody* suppress Senator McCarthy and put a stop to the "reign of terror" in our country?

The interest in Senator McCarthy was enormous; the total lack of understanding of what was really going on was even more enormous. Now I am neither a constituent nor an admirer of the Senator, but I found myself repeatedly in the odd position of trying to explain what he was doing, why it was legal in a free country for him to do it, and how it was impossible for a congressional investigation to cause a "reign of terror" in 160,000,000 people.

My task was made more difficult by the fact that many Americans with other attributes of a horse than horse sense were asserting loudly that McCarthy had indeed created a "reign of terror." Are *you* terrified? I am not, yet I have in my background much political activity well to the left of Senator McCarthy's position. The worst that Senator McCarthy can do to me is to ask me a lot of questions and demand answers under oath. I may resent some of the questions but I can answer them without taking refuge in the Fifth Amendment; there is no treason in my record.

To call such investigation a "reign of terror" is to stretch language out of all shape. My notion of a "reign of terror" consists of bandits in the bush who murder and loot in the dark of the night (Indonesia, Malaya, Kenya, elsewhere), jailing the opposition political leaders (Argentina, Spain, etc.), or killing them (anywhere behind the iron-and-bamboo curtain); it does *not* mean questioning people under the safeguards of the most thorough system for the protection of individual rights this world has ever known. It does *not* mean a few dozen traitors and/or custard heads taking refuge behind the Fifth Amendment on the sole grounds that to tell the truth would be to incriminate themselves.

I am not defending McCarthy's thumb-fingered approach nor his sweeping public statements. It has been argued that McCarthy's personality and methods have played into the hands of our enemies and enabled Communism International to make effective propaganda against us. There is some truth in this thesis but, in my opinion, not much. I think that a Senate investigation of communism in the United States would have been fought by propaganda just as angry, just as vicious, had the investigation been chairmanned by Thomas Jefferson with Daniel Webster as his chief counsel. The thing that the communists hate is not McCarthy's unloveable personality but the fact that he is daring to attack communism at all.

The other half is that the thing so many foreigners relish about this investigation is not the issue of communism, not the personality of McCarthy, but the fact that it gives an excuse to take a slap at the Fat Boy . . . Uncle Sam—Us. It is easy to hate the rich and the powerful; those who sneer at us for "McCarthyism" are just as ready to sneer at us for our inside plumbing—I have heard both sneers combined in one sentence.

The point of this aside while our party drives through beautiful new Lima is that the political institutions of another country are hard to understand. Outside the United States very few people comprehend the nature of a congressional investigation and it is almost impossible to explain it to them. They have it mixed up with the Inquisition, with Senator McCarthy having all the functions and powers of Torquemada. The idea that a private citizen can answer or refuse to answer a series of questions put to him by a senator, such that the record shows clearly that the citizen being questioned is now or has in the past been actively engaged in treason against the United States—and then get up and walk out a free man—is so foreign to most other people that they simply cannot believe it.

Furthermore, if they did believe it, they would be even more contemptuous of us for being so soft than they now are for "McCarthyism" as they comprehend it, i.e., which they conceive to be a policy of take-him-away-and-lock-him-up-I-don't-like-his-politics. Our extreme leniency, if they understood it, would strike them as preposterous, asinine.

The institution of political refuge as practiced in South America is almost as hard for us to understand. It is as if Adlai Stevenson had found it healthy to hole up in the French Embassy immediately after election day in 1952, for this is approximately what Senor Haya did. He ducked into the Colombian Embassy and stayed there for five years. The Peruvian government never gave up its contention that Haya was a common criminal charged with a capital crime; Colombia, which itself passed through three changes of government by revolution during the five years, never swerved from its determination to give asylum even though the various Colombian governments were not in sympathy with Haya's politics. But, bitter as the issue was, Peru never attempted to remove the refugee by force from the utterly undefended embassy; the principle of asylum was too precious even though Peru declared that Haya was not entitled to it.

Asylum is a necessary part of politics as practiced in South America. When bullets are used as commonly as ballots it is comforting to know that, if you find yourself out of power tomorrow, there are a couple of dozen safe spots right in your own capital where your successor's soldiers cannot arrest you, or possibly shoot you while "attempting to escape." This is as ameliorating an influence as our own Fifth Amendment.

(By the way, I have never heard of one of Senator McCarthy's so-called "victims" choosing to take refuge in the Russian Embassy.)

But why should politics in South America be such a rough and sometimes deadly game? I will spare you a 10,000-word essay on historical background, racial types, traditional institutions, and so forth, and admit that I do not know. But I do know that our northern political attitudes cannot readily be exported to South America. Our Latin neighbors are unanimously agreed on one point: they do *not* want Uncle to tell them how they must behave. Most South Americans are both intensely patriotic and fiercely individualistic. Most of them do not dislike us—we are probably better liked and for less reason in South America than anywhere else in the world. But while they will accept United States capital, products, and engineering, if offered with decent respect for their dignity, they will not accept any "do-gooding" from us in internal politics. They hate Yankee intervention much more than they hate their political opponents.

I suggest that in this they may be right. It took us a long time to achieve political stability; there are those alive today who remember the fratricide of 1861–'65. Political philosophy is still a long way from being a science, revolution is still the refuge and the natural right of the oppressed, and I contend that it is very hard to be sure who are the "baddies" and who are the "goodies" in any overturning of a government south of us . . . at least at the time it takes place. Chile and Uruguay are proof that they are not incapable of achieving stability without our busybody help. In the meantime, a policy of hands-off combined with a warm willingness to help when and how they want help seems to me to be the best we can do.

As we passed the Colombian Embassy we saw two armed soldiers on guard outside. Senor Haya was not in sight, but he was there; his long wait for safe conduct to exile had still four months to run.

The country club at Lima would have been a credit to any city of comparable size in the States and its kitchen would almost certainly have surpassed the comparable ones; we had a wonderful lunch at the ridiculous prices made possible by the exchange. A wedding reception party was gathering as we left; the senoras and senoritas were elegantly dressed and most of them were remarkably attractive, some were very beautiful.

For my taste the senoritas south of here live up to the propaganda about them. True, they do have a slight tendency to be broadshouldered across the hips, but, as the chief mate of the *Gulf Shipper* pointed out, in these parts two axe-handles across the hips is considered about right. The gringo liking for narrow hips is probably a passing fad if history is any guide. Besides that, girdles are terribly difficult things to manage in hot climates, so I have been told.

All of the women wore hats, just as they do in the British Commonwealth. But the hats of these ladies were brilliantly imaginative and frivolous whereas most British hats for women look like something built by birds in a tree and then abandoned.

Ticky was not wearing a hat and received a few surprised glances, but she carried it off with cold dignity. She had a hat with her on the trip (the one she uses for weddings and funerals at home, her only hat), but she declined to be intimidated into wearing it once she found out about a dispensation which permitted her to enter churches without one.

After lunch we visited the art institute and Jiron de Union, the shopping center. Lima has gone all out for modern architecture but the modern trends in painting have not made a dent. Nowhere did we find a painting looking like two fried eggs, one addled, or perhaps jackstraws in a high wind. The instructors actually required the students to learn anatomy, perspective, and draftsmanship—very reactionary, of course. I liked it.

Jiron de Union is the collective term for a narrow shopping street each block of which has its own separate name. This must be confusing to the postman; the tourist does well to ignore the street signs and simply keep an eye out for landmarks. The shops are quite well stocked but not equal to those of cities of the same size in the States, except for silver articles of all sorts, much of it of great grace and imaginative beauty and made remarkably cheap by the ridiculous rate of exchange. Ticky showed remarkable restraint, for it would be easy indeed to go wild and spend oneself broke there. Shortly we had to hurry back to the ship in order not to miss it.

As soon as we left Callao we started running across the furrows and the ship bounced for a couple of days down to Arica, northernmost point in Chile. A roll can be unsettling but a pitch really shakes up the stomach; the *Gulf Shipper* was moving around like a cayuse trying to get rid of a rider. I can now testify that Dramamine actually does stop seasickness, at least for this deponent. I am subject to seasickness and certainly would have been disgracefully and miserably ill without the drug; as it was I missed no meals and ate heartily. But I will never grow fond of excessive motion in a ship. It is annoying to have your soup in your lap, irritating to have to hop madly for balance when caught with trousers half on, not restful to fight the motion of the ship in your sleep.

But *anything* is better than seasickness. I include drilling for gum-line cavities without Novocain.

Arica has no harbor, only an open roadstead; the *Gulf Shipper* anchored and tied to a buoy, thus mooring her against swinging but leaving her still subject to the swells that bounced her around on the way down. Cargo was loaded and discharged by lighters which tied up around the ship like pigs around a sow. Ticky and I watched the first boat load of stevedores come aboard and were struck by their extremely colorful and piratical appearance; we kept expecting them to break into the *habanera.* But it was appearance only; so far as our own experience serves, Chilenos, all of them, are the gentlest and most kindly people in the world.

Sadly, many of them are wretchedly poor. The reason is obvious: it takes heroes to wrest a bare living out of much of Chile. The land back of Arica is as bare as the mountains of *the* Moon—I mean the ones on our satellite, not the mountain range in Africa. What we call desert in our own southwest is verdant jungle by comparison; there is *nothing* on these hillsides, not a weed, not a blade of grass, not even cactus. Yet the soil is not poor; where they have managed to bring water down from the mountains the ground crops beautifully.

Back of the desert shore the great wall of the Andes was clearly in sight for the first time, majestic and incredible, range on range of snow-covered peaks, awesome at any time, breath catching at sunset. It was decidedly worth while to hurry through dinner and rush up to the flying bridge to watch it, while the bosun birds and guano birds wheeled around the ship and discussed us.

The guano birds used to be a major source of wealth to Chile and to Arica in particular, until artificial nitrates reduced the importance of the trade for fertilizers and for explosives. There are islands at this port that are white with their droppings and any shift of the wind will bring positive, odorous evidence that the birds are still keeping up their end of the business despite new competition. But they are victims of technological unemployment; their end product is no longer indispensable.

Arica, although in Chile, is the great Bolivian tin port. A railroad runs from here to La Paz and Chile has granted Bolivia extraterritorial rights for a dock, a customs shed, and railroad terminus. The dock is not yet in operation but Bolivian tin comes out nevertheless, tin ore being the principal item the *Shipper* loaded there. The precious stuff is handled in small, tight sacks, sealed, marked with serial numbers, weight, and name of owner.

Arica is the site of the only United States sea battle fought on dry land. More than a century ago the U.S.S. *Wateree* was beached here five miles inland by an earthquake tidal wave. When the waters receded the stranded ship was attacked by Indians and the ship's company fought them off from the decks for several days. The boiler of the *Wateree* can still be seen, lying on its side; the rest of the ship has long since been carried away.

Ticky and I went ashore by company boat, by ourselves as the others decided not to risk getting into a small boat from a gangway in the continual heavy swells. It is an easy way to break an ankle if one is not used to it; the knack lies in getting promptly and without any hesitation into the boat just as it rises highest at the gangway, there being then a second when boat and ship are almost stationary relative to each other.

We made it okay, albeit clumsily, and the ride in to the landing was pleasant—a passenger in a liner never has a chance to get close to the water. There were no formalities at customs;

An officer smiled at us and saluted and waved us on through. Arica is a town the same size as Buenaventura (14,000) but it has none of the "tough waterfront" quality of many seaports; you are at once in parks and shaded streets. There are two beautiful parks downtown, impressively large for so small a place, and for a place where irrigation water is so valuable.

The thing that struck us first and with greatest delight was the singing of birds. The parks were loaded with birds singing their hearts out. I have never heard before or since so many birds singing at once. So great was the volume of sweet sounds that we could hear it long after we had left the parks behind.

It does not take long to see all of Arica. There are a few business streets down near the water and a church or two; the homes spill down the rather steep hills back of the business district. It is a clean and pretty town but poor; only a few of *the* houses would have been considered middle-class homes in the States. As is usual in Chile every householder raised flowers, even if the opportunity was limited to a few pots in the window.

We hired a car and were driven out into an irrigated valley hidden from the sea. Here there were truck farms, citrus trees, figs, cherimoya. The last is a delicious fruit almost unknown in the States, even though there is a Cherimoya Street in Hollywood. It tastes a little like a pineapple, a little like a cantaloupe, but mostly like itself; it is a favorite dessert in Chile and quickly would become a favorite with us, were the trees to be grown on commercial scale here.

The valley was not very extensive and there was no place else to go. The land was green precisely as far as irrigation had progressed and no farther; a foot beyond was the utterly bare and depressing desert. But a new, wide road was being built back into the valley and it was evident that reclamation was to continue. Most of the roadwork was being done painfully by hand and human sweat, but there was a "Plan Marshall" powered scraper. "Plan Marshall" is a term used with approval all up and down the west coast of South America; here, at least, we have been able to help without being kicked in the shins for it and called names.

There was a fine new school in the valley and an older one, although the apparent population seemed to call for no more than one small one. All through Chile we were impressed by an almost feverish pursuit of knowledge. Schools are everywhere, bookstores seem to be more numerous than grocery stores (probably a mistaken impression, that one). Students are everywhere; sitting on park benches, studying, or strolling slowly with noses buried in books, eyes fixed on print.

On the way back we detoured to the top of a small mountain which overlooks the city and the port. The road stopped half way up and the driver, with complete aplomb, turned off onto a railroad track and continued on up. The view from there was magnificent and the odor of guano almost overpowering. We could pick out the *Gulf*

Shipper from the others in port. Far below us, it was a toy ship fit for a bathtub.

A flag there marks the spot where a Peruvian general, defeated in battle, suicided by riding his horse off the cliff. The driver and I discussed it and decided that a mule would have had more sense. Looking back, I do not know how we discussed it, for the driver had no English at all and the Spanish I know could be written on a postcard without crowding the stamp; it is suitable only for ordering *dos cervezas* in a cantina. But I recall the conversation clearly even though I don't know how we talked. Somehow, two human beings can always talk with each other if both want to.

We got back to town with a half hour to spare and again looked around the shops and listened to the birds. We came across a boy and a girl, perhaps five and seven, with their noses pushed against the window of a toy shop. By their clothes, it seemed unlikely that they would ever get closer than looking and longing, so Ticky took them inside and told the proprietor to let them each have the item each was staring at. The kids did not take advantage of us; the doll the girl wanted was the one she had loved from through the glass, not the most elaborate and expensive one, and the boy simply had his eye on a large ball, not at all expensive.

They thanked us gravely, coached only a little by the proprietor, and went away looking soberly happy. Ticky and I, having set up our own Marshall Plan, went back to the ship in the warm glow that comes only from playing Santa Claus. One of the real magics in life is the fact that wealth can always he multiplied by dividing by the age of the owner.

(Now if that gent in the back row who just made the snide remark about American tourists who love to flash their money in the faces of people less fortunate will step out in the alley with me, I will try to find out how tightly his teeth are set in his head. With Ticky's help, that is—she has studied judo.)

The next port was Valparaiso, our destination. We were anxious to do something before we left to show our appreciation to the ship's officers for many kindnesses and much hospitality; a party seemed in order. We talked it over with the Markhams and Mr. Tupper and planned one. It had to be held at sea, which meant that some of the watchstanders would be able to make only token attendance and the Captain would not participate in the wholehearted fashion which was his wont ashore, but there was nothing else for it as Ticky and I would be leaving the ship immediately on docking at Valpo.

Martinis in water tumblers seemed a little rugged for a party held at sea and anyhow Ticky wanted to serve French Seventy-fives. As everyone knows, the French "75" is a small, obsolete weapon, ineffective in modern times. Its namesake is also innocuous, being composed of lemon juice, sugar, cognac, and champagne. The lemon juice supplies vitamin C and thereby helps to prevent scurvy, always a menace at sea, and the sugar gives quick energy. As for the other ingredients, they are so thinned out by the lemonade and cracked ice that they do no more than impart a pleasant flavor. In fact, unless advised, you would never believe that it was anything but a soda fountain drink—at first, you would not.

The exact formulation is a matter of taste. Some like it not too sweet, some like it not too sour, some think that too much ice is bad for the stomach. But it needs plenty of champagne to provide bubbles and cognac to give it body.

Cognac was not available so we had to fall back on pisco, which is a grape brandy, too, although made (I believe) from *very* large grapes. Real French champagne was hardly to be expected but Chile makes excellent champagne-type sparkling wines. I do not know what proof they are. The purser acted as purchasing agent for us before we left Arica. At two hundred pesos to the dollar the total bill was about ten dollars—the bottle alone should have cost more than that, empty.

We stocked up also on assorted nuts and olives and such like munching food and sent out formal invitations, from all the passengers inviting all of the officers to an emergency session of the Horse Latitudes Philosophical Society and D.M. Club. Everybody accepted.

The gals put on formal evening gowns, seldom seen in a freighter, and quite a number of us wore neckties, making it a swank affair. It started out a bit slowly as formal affairs often do, but French Seventy-fives have a characteristic and rather slow effect on the emotions; the first salvo is over, the second salvo is short, and the third salvo is usually dead on, after which everyone is *muy simpatico*.

It was an occasion both pleasant and sad. The *Gulf Shipper* had become another home to us, and our shipmates were our family. We danced to the radio and we sang and we told stories but over it all was the knowledge that we would never meet like this again. However, the supply of ammunition held out and it is hard to be anything but merry when one of those salvos hits you dead on. I remember telling the chief mate that I was thinking of selling our house and taking a permanent lease on stateroom number three. He applauded the notion and we had a drink on it.

Around dawn we reluctantly adjourned. I stood the rest of the four-to-eight watch with the mate on watch and then went down to breakfast. Ticky was a little tired but we were both determined to show up for breakfast as a matter of face—after which we went back to stateroom number three and died.

I had no more than fallen asleep when I was snatched out of happy dreams by the most terrifying clamor I have ever heard.

I found myself standing in the middle of the room trying to put on trousers; I had both feet in one leg and it was not working out too well. I became aware that Ticky was shouting at me. "Stop it! Those aren't yours."

I stopped. Sure enough, they weren't. They were Ticky's slacks and were not only much too small for me but had curves tailored in in the wrong places. I passed them over as she said, "What in the world *is* it?" The awful clamor continued.

"General alarm," I grunted. "Man the life boats. *Hurry!"* We did hurry, for I was reasonably sure the poor old *Shipper* was going down and I had just enough life left in me to wish to save it—or perhaps it was instinctual reflex. We were at our boat stations and quicker than some of the crew. We were fully dressed, aside from buttons and zippers and similar nonessentials, and were wearing our life jackets. The sea was calm and the weather clear; I tried to figure out the nature of the disaster. Perhaps war had broken out suddenly. There was a notice posted near the saloon telling what to do in case of atomic attack but I had not read it since the day we embarked.

Our life boat station was right under the bridge. Captain Lee leaned over the rail and smiled at us with fiendish delight. "Good morning!" he said.

The expression on his face was enough to turn it from a disaster into a boat drill. My mind started functioning again and I understood it all. The Captain, inhibited by his responsibilities as master of a ship at sea, had gone to bed early from the party. He had gotten up early as well, breakfasted in his cabin as was his custom, then had looked around to find a ship deserted and utterly quiet save for those on watch. Being of a sociable nature he had cured that by switching on the general alarm, a sound guaranteed to get Davy Jones out of his locker.

No one can criticize a ship's master for holding boat drills; the book even advises that they be held by surprise and this one certainly qualified as such. But I was convinced at that moment that he had sounded that alarm for the prime purpose of getting me personally out of my sack. Right then I would have beaten him to death with a flyswatter had I had the strength to lift one.

I'm sure Ticky would have held him. I would have needed help; he is considerably bigger than I am.

That man has a low sense of humor.

By evening I was able to grin about it, although feebly. By the time the *Shipper* stood into Valparaiso I had decided to forgive and forget; after all we were *amigos* and brothers. I was fond of him and I knew he was fond of me.

But when he comes to stay with us in Colorado Springs next year he had better watch out for snakes in his bed and not go through doorways too hastily. Maybe I can lure him onto ice skates.

Valparaiso does not have the most spectacular harbor in the world; that honor probably goes to Rio with Sydney and San Francisco fighting it out for second place. But it is one of the most beautiful. The shore line, almost circular, looks like a backdrop painted by a scenic artist with a fine eye for color and composition. We had plenty of time to look at it because the port authorities required us to tie to a buoy in the outer harbor to discharge a few drums of naphtha before we were considered safe to come alongside dock.

The minor heavenly functionaries in charge of such things provide arrangements like this to insure a certain routine every time a ship comes into port: first, the passengers must be required to get up earlier than usual, preferably with a big head acquired at the Captain's Dinner; then they must be examined by the port surgeon and various police and immigration officials just as they are about to sit down to breakfast; next, the actual departure from the ship must be delayed so that they will arrive at customs just as it closes, or so timed as to miss a train, or both.

This is a cosmic plan, not a human plan, for the humans who play parts in it are almost invariably polite, helpful, and anxious to expedite things. Other factors have to be thrown in to foil them of their kindly intentions.

The drums of naphtha almost accomplished the full routine for us at Valparaiso had not Mr. Thackeray, agent for the Grace Lines and acting for Gulf & South American, owners of the *Shipper,* set himself firmly against the plans. Once the *Shipper* touched dock and put over a gangway he got us through the stem with such speed that I am still gasping.

Mr. Thackeray is a handsome, blondish young man who ,peaks perfect American. I assumed that he had been sent down from the States but he smiled and said no, that he was a Chileno ho had never been out of his native country. This was our first contact with the dual fact that Chile is the most Latin of Latin American countries in many ways but the Chilenos do not look Latin according to North American preconception of that term. Tall blondes seem almost as common as they are in Sweden. There are many Chilenos of Irish, German, and English ancestry—but they are *Chilenos,* thoroughly assimilated. Most of them speak nothing but Spanish. Even the English seem to assimilate better in Chile than in most places. In Chile they become Chilenos, even though they tend quite sensibly to hang onto the very real asset of English as a second language.

In the meantime our ten suitcases were piled mountainously on the dock and, as I had dismally predicted, the customs shed was a long way off. Part of my gloomy prophecy was wrong: it was not raining, there was merely a fine mist. But the train we had to catch in order to claim our hotel reservation in Santiago was to leave in only thirty-five minutes.

Perhaps I should add that trains run on time in Chile, better than they do in Colorado.

Mr. Thackeray conjured up porters with two hand trucks. Mr. Thackeray produced a Ford station wagon belonging to the Grace Lines. Mr. Thackeray negotiated the movement of our baggage, which had to be done along the docks inside the customs barrier, then settled us in the station wagon and whisked us outside the barrier into the streets and over to the customs station in comfort.

There were no customs officers at the customs shed. Mr. Thackeray glanced at his watch, looked perturbed and said, "I'm afraid they have gone to tea. It's about that time."

"Do they close down completely? Isn't someone left on duty? It's not very many minutes to our train time."

"I'll see what I can do. Nothing can be done until your baggage shows up anyhow." He went away, leaving me with half a dozen fretful questions about was he sure the porters knew where to come and how far did they have to come and how long would it take and where was the railroad station and when was the break for tea supposed to be over, all unasked.

Ticky and I sat down in the big, bare, gloomy shed and shared a cigarette and thought gloomily about home.

In about ten minutes the porters arrived, slightly wet and very cheerful. I counted the ten suitcases and cheered up a little myself, just to see them. Mr. Thackeray returned, helped me pay the porters and, by request, advised me how much to tip. They seemed very much pleased with the tip—tipping is not as common in Chile as in Peru or as it is at home—and began spreading our baggage around the inspection tables. *"Las naves, Senor?"* one of them asked.

"Give him your keys," Mr. Thackeray advised. "It will save time. I think I'm going to be able to get one of the customs officers to come in." He went away again.

The porters promptly got into trouble with a Valapak and I promptly had trouble with Ticky. It was not their fault; a scarf was packed immediately under a zipper in the Valapak. The thin silk caught in the zipper and jammed it; they tried to force it free and it got worse. Ticky sprang to the defense of her cherished chattels and tried to push them aside. With courteous gallantry they assured her that they would take care of it and did not give way. They spoke in

Spanish but the meaning was inescapable.

Three of them continued to sweat and strain while Ticky skittered around them, trying to push her way in, wringing her hands, demanding that they back away and let her do it, and shouting for a pair of pliers in a language known among her hearers only to me and I did not have any.

Shortly there was a ripping sound and Ticky burst into tears. She then started expressing an emotional opinion of the country and its people. I took her firmly by the elbow and led her to the bench. "Sit down," I said fiercely, "and shut up. Remember what I told you eight thousand times on the way down. No matter what happens at customs, you must smile, smile, and smile some more."

She sniffled and said brokenly, "I think it's an *outrage* that I have to sit here and watch while those men *ruin* my things."

"It was just a scarf. Forget it."

"I am *not* going to let anyone paw through my underwear!" She sniffled again. "I want to go *home."*

"Too late. We can't even get back aboard ship. Somebody else has our cabin."

"I am not—"

"You are going to sit still and shut up."

She shut up but she had all storm warnings still flying. Mr. Thackeray returned with a customs officer. But now it was my turn to get off on the wrong foot.

The *aduanero* had left his tea a good twenty minutes early to help the gringos catch their train. I think he must have regretted it at once when he saw that the *norteamericano* did not have ordinary good manners. I could see that he was not exactly jovial and attributed it to his being interrupted at meals; I tried to be ingratiating, but I did not put it over.

Mr. Thackeray touched my arm. *"Take your hat off!"* he whispered insistently. "He is growing quite annoyed." I snatched it off and blushed. "Please tell him I'm sorry." I had forgotten an elementary fact, a common element in many other cultures but unknown in the United States. This tired little official was not expecting me to take off my hat to *him.* He would never expect such a thing, unless we did so mutually as two equals meeting. But we were not meeting as equals; he embodied at that time and place the *sovereignty of his country* and he damn well expected me to show respect for it. It was symbolically equivalent to standing up for "The Star-Spangled Banner."

In the United States the President himself is almost the only official accorded such respect *for such a reason;* even governors don't get much of it. We show respect to individuals when and as it suits us, according to the respect that individual has earned in our eyes. We show respect to high office in government, business, church, professions, or the military on the assumption that the holder of high office, be he bishop or brigadier, has probably earned respect or he would not have gained rank. But the notion that the most minor public servant embodies the visible presence of the sovereign state is an idea that has passed us by. An American, if he thinks about it at all, is likely to carry it one step farther and recall that *he* is the state, he himself—not that cop over there.

Of course the cop is a sovereign citizen, too, but *as a cop* he is not sovereign but a servant of sovereigns . . . and the same for all other public officials, servants not masters.

But our attitude is far from being universal. The phrase "On the King's Business—" conveys a very different notion. In Germany a few years back (and for all I know today) there was an offense which freely translated read: "Disrespect to an Official of the State"—by which was meant that you could be fined for arguing with a street car conductor! There are many places in the world where all public functionaries—policemen, school teachers, postmasters, train conductors, assessors—receive formal, hat-in-hand respect quite different from ordinary courtesy. To fail to offer it is to court inconvenience or even more serious trouble. In some hot-tempered places such as Indonesia a mistake in such protocol can be dangerous to life and limb.

But not in Chile. The *aduanero* was mollified at once when I uncovered. He quit frowning and stalling with the declarations and went through our bags with great speed and very little disruption of the packing, so fast that I was pushed to keep up with closing and locking them. Mr. Thackeray said, "That's all let's go we'll catch that train yet!"

"Where's the station?"

"Just across the way." He hurried out, followed by me, Ticky, porters, and suitcases. He shoved money through a ticket window, seemed to snatch two tickets out of the air, and rejoined us without slowing down. "This way!"

There was no time to check bags; Mr. Thackeray arranged with the assistant conductor to stow them in the vestibule of a car, then urged us on board. The train pulled out as we sat down.

With the departure of Mr. Thackeray we at last found ourselves truly in a foreign country and a long way from home. Up until that time the *Gulf Shipper* had kept home with us, no matter if the stars changed and Orion stood on his head. Mr. Thackeray's sophistication, skill, and linguistic ability had sheltered us through the complexities of transition, but now we were alone. For the first time we felt twinges of homesickness.

We soon discovered that we were cut off in another way: there was no one at all around us who could speak English. I wanted to find out when the train reached Santiago. I was not dead sure that the train ended there; perhaps in our mute ignorance we could be carried on past it. Or even if Santiago was the last stop, it might have several stations, like Philadelphia; we might wind up many miles from our hotel.

I tried each member of the train crew as he passed down the aisle —no luck. I tried English on everyone near us—still no luck. I glanced around farther to see if anyone had looked up at the sound of English —not a soul. I felt around in my pockets and confirmed what I had suspected; all three of the Spanish phrase books we had with us were packed in our luggage. I recalled sourly the guidebook which stated that most metropolitan Chilenos spoke English and that all hotel people, all taxi drivers, and all persons connected with railroads and airlines spoke it fluently—I wondered if the hack who wrote that guidebook had ever been out of Dubuque and decided that he had probably smoked up his lies in the public library.

I was not blaming the Chilenos. The fault was mine for not having learned the beautiful and easy Spanish tongue; I myself would be little help to a Chileno lost in Colorado Springs. It was simply unfortunate that both Ticky and myself had elected French in school, rather than Spanish.

I considered tackling them in French, then got cold feet. My French is only a bit better than my Spanish; I am not a linguist.

At last I again tackled the exceedingly English-looking young man seated in front of us. (He looked as if he *must* know English.), With the aid of a card and a pencil and a monumental effort by which I recalled that the Spanish word for "hour" was the same as the Latin I established that we were indeed on the train for Santiago, that it arrived at 8 P.M., that the distance was about 150 kilometres, and that we should get off at the last stop in order to reach Hotel Carrera. I had interrupted his reading but he was all patience and friendliness.

It was the only time I was ever troubled by a language barrier. I never will be worth a hoot at any other language; I am eye-minded and even the English language can go too fast for me. But patience and friendliness are everywhere, and the use of writing (to tie down both the question and the answer and allow it to be studied), plus the use of the universal numerals, plus a cognate or two, are enough for any situation. Besides, the chap that wrote the guidebook was not too far wrong; there is usually someone within earshot who is happy to help.

("What sort of people," the frightened boy asked, "are there in this great city?"

(The gatekeeper considered it. "What sort of people were there in your home village?"

(The boy's eyes filled with tears and his voice choked. "They were the most wonderful, the kindest people in all the world!"

("Go on in, son," the gatekeeper said gently. "You will find them much the same inside.")

After I had settled my old-maid worries we relaxed and enjoyed the ride. The train was very fast and the scenery varied from pleasant to magnificent. Santiago sits at the foot of the Andes at 1800 feet; the railroad winds up the valley of Rio Mapocho to reach it, through farms and foothills and mountains. We were in the southern rainfall belt and the hills and fields were green. The countryside looks like that near Santa Barbara, California, and numerous eucalyptus trees added to the impression.

Presently the train's news butcher came around with tea. We had been advised to be wary of the local water but tea seemed a safe bet, and we were both hungry and thirsty, it being far past dinner hour in the *Shipper.* The train attendant hung little trays for each of us on the backs of the seats in front of us, then sold us, at charity prices, tea and sandwiches and strange little cakes. One sort seemed to be expanded nitrocellulose with sugar added but it was probably principally white of eggs.

Then I bought magazines from him. We looked at the pictures and tried to puzzle out the text and told ourselves that we were "improving our Spanish." Perhaps we were, since any change would have been an improvement. I remember one cartoon strip which showed Perlin of Argentina cussing out Uncle Sam for the benefit of an audience, then, in the next frame, falling into Uncle Sam's arms with shouts of *"Amigo!"* But most of it was not that easy.

When we reached Santiago, the young man in front of us, the train butcher, the assistant conductor, and several passengers all told us that it was time to get off. "Taxi" and "Hotel Carrera" were all the words we needed. During the ride to the hotel we could not see much of the city as it was after dark, but it was evident that it was a big, bustling, modern city. The Carrera itself is a hotel equal to any anywhere in its standards of luxury, modernness, and convenience. It differs from similar hotels at home in that the service is better and the prices are less than half what we would have to pay at home. The doorman spoke fluent English with an Irish brogue, the night manager, Senora Falco, spoke English with an Oxford accent, and we had no more troubles. Not having had time to get other advice I asked the head porter himself how much to tip him and his assistants; his suggestions were most moderate.

Our room was quite large and beautifully furnished. The night maid bustled in and turned down the beds. When she had gone I heard Ticky's voice from the bathroom. "Bob! C 'mere!"

I came. She was pointing at the fourth fixture in the bath. "Look at that!"

"Well," I said, "surely you have heard of them. You didn't think it was a drinking fountain for a dog, did you?"

"I've heard 'of them," she said thoughtfully, "but I guess I didn't really believe in them. I don't think I would dare use one. Look." She fiddled with a valve.

"Don't splash the ceiling!" I said hastily.

"That's what I mean," she said, shutting it off. "I'd be afraid of being blown through the roof."

III

First Steps

WE MANAGED TO do quite a lot of sightseeing in Santiago and outside it but I don't see quite how we did it; the routine does not provide for it. It starts to get out of step with our habits at dinner time. The first night we were there we washed up quickly and got down to the dining room about half past eight, starving, as the sample of tea aboard the train had not substituted for the hearty dinner at five P.M. we had grown used to in the *Gulf Shipper*.

The dining room looked like an undertaker's parlor ready for a funeral—banks of flowers, hushed quiet, sad-faced Indian waiters, maitre d'hotel immaculate and dignified in white tie and tails . . . no diners, no cheerful sounds of food and drink. But I was assured that we could have dinner although it was evident that our arrival was unexpected. "Perhaps M'dame would like a cocktail before dinner?" M'dame would, and so would M'sieur; it restored the tissues, soothed travel-weary nerves, and helped to kill the time while the chef was coping with the emergency. Presently food, wonderful, lavish, beautifully cooked food, was spread before us. I had a mixed grill which contained eight or nine things I did not recognize but wanted to know better and Ticky had a steak that had died happy. There were soups and salads and a variety of breadstuffs, too, and other things I can't remember, and delicate light wine and the inevitable bottled water served in tiny glasses. They were used to gringos and there was no trouble in getting *agua sin gas.* Afterwards we had to make a Solomon's choice among desserts.

I was tempted by pineapple slices drowned in champagne but finally settled for "happy cherimoya"—cherimoya *alegre,* thin slices of the fruit in orange juice and powdered sugar. We were both happy, the cherimoya and I.

By the time we were sipping coffee the room was filling up. By the time we left, somewhat after ten o'clock, dinner hour was in full blast. We had come to the right place; we were simply too early.

This late dinner hour throws the whole day out of gear for a *norteamericano.* We were not used to going to bed on a full stomach; with dinner over about eleven at night that meant lights-out not earlier than one in the morning, and still later if we chose to do a little dancing. We did not do that very often as my Coolidge-Era foxtrot does not fit a rumba beat too well.

But even without night life the late dinner hour means getting up late. Breakfast plus formal guard mount last until about ten-thirty. We were not required to watch formal guard mount, of course, but there it was, right under our window in the Plaza de la Constitucion in front of the presidential palace, complete with army band in dress uniform, small boy to pretend to lead the band along with the director, and small dog whose international duty it is to help out with parades everywhere.

After guard mount there is time to sightsee before lunch but it is also the best time to go up to the swimming pool on the roof. This hazard can be avoided by staying in a hotel which does not own a *piscina,* at least not one on the roof—but who wants to avoid the temptation? The view from the open-air restaurant & swimming pool seventeen stories up in the Carrera is the best in Santiago, whether you look out at the city and the mountains, or inward at the senoritas swimming and sunning themselves. For thirty-five cents you may use the beautiful pool yourself, or you can sit and drink Coca-Cola or what you will and ponder on the fact that you are nearer to heaven than you are ever likely to be again.

You can sit right there all morning and have lunch there, if you choose, and it is a good choice. Santiago sits in a big level bowl with mountains all around it and the main range of the high Andes crowding close to it on the west. The lights and the cloud formations on the snow-covered peaks are always changing and the city below is a Christmas window display of toy automobiles and ant-sized people. You can see from here that many, many roofs in Santiago have roof gardens; anywhere a Chileno can poke a flower and coax it to grow he will do so.

Whether you lunch there or make the effort to go two blocks down the street to the world-famous French cuisine of the 'rillon, after lunch is time for siesta, not for sightseeing. The shutters ring down in the small shops, the doors lock in the big shops, and even the traffic policemen go home. Why bother to direct traffic when no sensible person is on the streets.

So we return now to the Carrera, start to write a letter or a few postcards—then find ourselves overcome by the spirit of siesta. How can one stay awake in the drowsy afternoon when a million and a half people are sleeping?

When at last we come to, awakened by the post-siesta increase in traffic noise, the city is wide awake again. But now it is time for tea, a meal not to be skipped in a country which allows nine hours between lunch and dinner. Tea may he had on the mezzanine with live music, or on the roof with sunset over the Andes. After tea the shops are still open until seven P.M. or later, and the interval from tea to dinner is also the favorite time to go to the movies. It is also a wonderful time to stroll along Alameda Bernardo O'Higgins, a boulevard of smart shops and mansions. (Do not be misled by the County Cork name: O'Higgins was the George Washington of Chile.) Or one can wander through the park by the river, a few blocks from the hotel. Any of these activities, done not too strenuously, will give one an appetite for the late dinner and keep one away from the hazards of a two-hour cocktail hour.

After dinner it is much too late for sightseeing; it is a choice of night life, letterwriting, or reading, then to bed.

You see? A day broken up by four meals and a siesta leaves very little time for anything else. The Chilenos themselves put in an eight-hour work day, from nine to one and from three to seven, but a tourist, already geared down by the holiday spirit, finds this broken up day lapping over on itself.

Nevertheless we saw a great deal. One day we drove down to the beach through a different valley from the one we had come up by train and ended up at beach resorts about twenty-five miles south of Valparaiso. Most of the route was rolling hills and farms, then one drops rather suddenly to splendid beaches and lovely summer homes. The flower gardens around the homes are startling in their banked profusion and unreal, Kodachrome color. Even in Southern California or Florida we do not attempt to grow flowers in the bursting quantities which a Chileno householder seems to take for granted. Driving back we passed many huts of extremely poor peasants; in every case the tenant had splurged some part of his precious irrigation water to put a flower garden around his humble home.

On the trip back we passed a number of vassos, which helped to satisfy Ticky's desire to see colorful natives in colorful native costumes; the blanket and hat of the vasso are indeed colorful. (U.S.—cowboy & ranch; Chile, vasso & fundo; Mexico, vaquero & rancho; Argentina, gaucho & hacienda.)

We visited a dairy fundo as we neared Santiago and were shown around by Senor Quirigo, the *gerente* or manager—in Argentina he would be a majordomo. It differed mainly from one of ours of equal size in that hand milking was used rather than power milking; sanitary precautions were up to standard and pasteurization was used. The home of the Quirigo family and that of the owner were in the style we call "California Spanish" with white walls and red tile roofs.

I had only feeble French in common with Senor and Senora Quirigo, but Ticky used botanical Latin. To become a ranch manager in much of South America a college degree in agriculture is usually necessary, which includes of course a firm scientific grounding in botany; Ticky and Senor Quirigo would agree on the Latin name for some tree, shrub, or flower among the profusion in the garden of the fundo, then would exchange the common English and Spanish names to their mutual great satisfaction. I stumbled along behind, agreeing that yes it was a pretty tree, *lindisimo* in fact.

Our driver had simply driven into the fundo and stated that he had some *norteamericanos* who would like to see a fundo; the Quirigos entertained us as if they had been waiting for the privilege.

The shops in Santiago are, if anything, poorer in most respects than those in Lima. The country is undergoing a disastrous inflation and has never recovered from the blow of the collapse of its nitrate industry. As yet they have very little manufacturing of their own and anything that must be imported is tremendously expensive in their currency. This shows up in a rather startling fashion with respect to paper. We use paper and paper products of all sorts in lavish, wasteful fashion; I doubt if there is a single paper napkin in all of Chile. Kleenex cannot be purchased. Wrapping paper is scarce; a clerk appreciates your willingness to accept a purchase unwrapped. He will wrap it if you wish but he uses precisely the minimum of paper necessary.

Linen napkins are freely available; Chilenos are not afraid of the labor of laundering. But a cheap paper napkin is another matter.

It is distressing to see a decent, industrious people in such straits. This is not a country kicked around by revolution after revolution, with each new boss looting the treasury; they have a tradition of stable, democratic, free government as strong as ours. It is simply that they are faced with real physical economic problems. But I am convinced that they will overcome them; they work hard and they are honest.

We attended an outdoor, free symphonic concert in the grounds of the Palace of Fine Arts in Santiago. By accident, we happened to be coming out of the palace (a fine gallery, with an amazing number of European old masters hanging) just as the seats were being set up. By spikking the macerated, lacerated Espanol that I had acquired—a

Pidgin of no tenses, numbers, genders, or other nonessentials—we found out what was about to happen and got seats early . . . which was a good thing as all of Santiago and cousin Jose from the country showed up.

The program presented one number by a Chileno composer, one by George Gershwin, and several by traditional European composers, with none of the atonal modern stuff, which pleased me as I am as black a reactionary in music as I am in art. It was pleasant to see Gershwin classed without apology as "symphonic" even though the notion may strike some of our own highbrow critics as terribly bourgeois.

In the midst of the concert a little boy about five, very well dressed, came pushing through our row, stepping on feet and hurrying. He really was in a hurry; there was a tree a few inches from my right knee and he wanted frantically to use that tree. He used it, sighed with relief, buttoned up his fly and went back to his parents in less of a hurry. Ticky and I did our best to keep our faces straight and pretend that we had not seen anything; we were both aware that South Americans are much more casual and frank about such necessities; anyone with eyes could not help but be aware.

No one around us in this polite and well-dressed crowd paid any attention, except a senora on Ticky's left. This unfortunate lady, having spoken with us, was aware that we were *norteamericanos;* it became at once evident that she was sufficiently cosmopolitan to see the incident through the eyes of a North American, and she was distressingly, terribly embarrassed.

Anything at all that we could have said would only have made things worse. There was nothing to do but let her suffer. But I can see that a compounding of such harmless incidents will in time and a rather short time cause the fierce pride of all South Americans to drive them into ending this carefree custom lest they be laughed at by the gringos—as sure as the missionaries put Mother Hubbards on the pretty Polynesians.

The French, on the other hand, don't care whether we laugh or not.

There are two *cerros* in downtown Santiago, each of which is a park; a *cerro* is somewhat more than a hill, somewhat less than a mountain. Cerro Santa Lucia is the smaller but in some ways the more charming. It was once the headquarters of the Spanish conquerors but is now nominally given over to a museum of Chilean history. I say "nominally" because its real functions are to provide in the daytime a lovely study hall for the many students in Santiago and to provide in the gloaming a perfect place for lovers to court.

It is a series of terraced gardens and winding paths and garden seats. Admission is a cent and a half, our money, which makes one wonder how they can support a gatekeeper even if they let him keep all the admissions. In daylight hours it is crowded with hundreds of students, highschool and university, all studying, none loafing. Quite as many are strolling as are sitting down, but the studying never stops.

As soon as it starts to get dark the park fills up with couples. The chaperone is a thing of the past in Chile; senoritas are not tagged around by duennas keeping a close eye on the property. There is a cop in the park but he is not there to bother them; he is there to see to it that they are not bothered. But *honi soit qui mal y pense;* one is justified in assuming that Cerro Santa Lucia, where romance is accepted as one of the good gifts of God, is in truth a bit more proper than any lookout point or drive-in theater in the states.

In South America, praise be, you can kiss your wife on a crowded downtown sidewalk without causing anyone to stare. You can even kiss another man on both cheeks for that matter, although personally I have never cared for whiskers.

Cerro San Cristobal is much more nearly a mountain and is ascended via a funicular railway. The vendor sold us first-class seats (at six cents) instead of second-class (at three cents) before we opened our mouths—being a gringo must show, though I don't know just how. All the natives rode second class, the only difference being that the cushions on the seats were thin in second class. I looked for, and did not find, the safety device for funiculars where a catch drops into place immediately if the tension on the cable fails. I did not mention this until we were down again as I had assured Ticky that all funiculars were so equipped everywhere. Probably Saint Cristobal protects this one; nobody has ever been hurt.

Or it might be the Virgin, as the *cerro* is the site of a great statue of Maria Inmaculada, seventy-five feet high and weighing about 400 tons; it must have been quite a job to get it up there and put together. The mountain as a whole is too large to irrigate but the top is gardened and a little church nestles under Her skirts. The view is what you would expect—we've been over that ground.

Further down the *cerro* are the National Zoological Gardens. I am a sucker for zoos. We visited the one in Lima, which consisted solely of South American birds and animals; the zoo in Santiago was a global one but seemed to lack the one thing that made the zoo at Lima outstanding: Andean condors. The condor is not only of noble size; he seems also to like to spread his wings for display, an effect like a Stratocruiser coming in for a landing.

We climbed a great deal of Cerro San Cristobal several times, trying to find more condors. I am not sure they don't have them; they may have been inside somewhere. But time at a zoo is never wasted; we saw lots of other things including that repulsive oversize South

American rat about the gross of a fat shoat. We were the only spectators, it being siesta time; the zoo staff were stretched out here and there, snoozing and sometimes looking up at the *locos norteamericanos* walking around in the hot sun.

We walked back to the hotel, as the taxi drivers were taking siesta, too. The Chileno is a very sensible fellow.

Regrettably the day arrived to leave Chile. It was necessary to be out at the airport nearly an hour early in order to go through outgoing customs and police check, both of them useless ceremonies. In the last-minute scurry Ticky remembered that we had not left a thankyou gift for the night maid; since she was not around I called the desk to get her name. "Senora Hoan-Ace," I was told.

"Spell it, please."

"Hoan-Ace—J, O, N, E, S."

"Oh—"

We flew in Pan American's *El Inter-Americano,* a luxurious, pressurized DC6B. The hostess had a luxurious and pressurized look about her, too. Airline hostesses have probably done more to popularize air travel than all other factors put together, but where in the world do they find them? They all have beauty, intelligence, friendly charm, and the hard, practical ability to cope with impossible situations more to be expected of barroom bouncers.

We were lucky in that it was a beautiful, clear day which permitted the pilot to detour and drop down to let us have a look at the Christ of the Andes which stands on the border between Chile and Argentina and celebrates eternal peace and friendship between the two nations. We had a quick view and then it was gone; from the air at more than three hundred miles an hour is not the way to see a statue. But the Christ of the Andes is not easily seen any other way; high up in the Cordillera, it is probably as hard to reach as any statue in the world.

Our real luck was the view of the mountains permitted by the good weather. The Andes are magnificent from a distance but terrifying from above—and from the sides, as we flew between peaks more than 22,000 feet high. The endless snow fields, the sharp, raw cliffs and crests, are frightening; I felt relief when we were at last out of the mountains and over the endless plains of the Argentine, even though I had relished it immensely and would not have missed it.

I had wondered from time to time just why the Andes are so much more impressive than other mountains. Ticky and I have our home on the foothills of a mountain more than 14,000 feet high. We are very fond of it and it really is a big mountain, but it is not in the same class with the Andes. A little arithmetic shows why and proves why the Andes may reasonably be considered the highest mountains in the world, despite the Himalayas—thus: heights of mountains are measured *above sea level.* This is crucial to an alpinist half dead from anoxia on the crags of Mount Everest but it has nothing to do with how tall a mountain looks; its majesty depends on how high it thrusts up above the plateau at its base.

By this rule:

Pikes Peak-14,000 minus 6000 gives 8000 feet apparent height.
Mount Everest-29,000 minus 15,000 gives 14,000 feet.
The Andes-22,000 minus only 2000 gives 20,000 feet,

which leaves the Andes the winnuh and new champion by more than a mile in height which you can raise your eyes and see.

There are other criteria. Mauna Loa in Hawaii is 32,000 feet high from summit to base, but 18,000 feet of it is concealed by the Pacific Ocean; you can't see it. Nor can you see barometric pressure or "sea level" height. A barometer states that my home is 6015 high; unfortunately only the last fifteen feet of that shows from our garden; the Chrysler Building, a full mile "shorter" than my home by the sea-level scale, is nevertheless a bit more impressive.

The same commonsense criterion that makes a great skyscraper more impressive than a one-story house states that the Andes are the tallest mountains in the world.

The transition from the Cordillera to the prairies and the plains in Argentina *is* much like the same transition in the United States, except that the great open spaces are even more so than our own, even though we were flying over the most populous part of the back country. There were hundreds of miles of open range and farm with only an occasional village and very few roads. It was impressive in scope but monotonous.

I stared at it and tried to get my thoughts straight about Chile. What was the spirit of Chile? What characterized it? The guidebooks emphasized the Chilean wines, and the fish both for catching and for eating, and the outdoor sports of all sorts, from skiing to surfing. All those things were true but they did not seem to me to spell Chile; take them away and the spirit of the country would remain.

No, not fish, not wines, not sports—but flowers, and serious pursuit of knowledge and an overwhelming kindliness. These were Chile.

IV

The Land of "Papa"

ONCE UPON A time a big, sleek, fat Argentine dog met a little, skinny, wretched Chilean dog at the border between their two countries. They exchanged sniffs and discovered that each was headed for the other's native land. "But *why?"* the Chileno mutt wanted to know. "You don't know what you are getting into. I love my native land but I've just got to make a change; I haven't had a square meal in months. But Argentina is already your home and you are well fed, fat, healthy, obviously in the pink—so why don't you stay where you are well off?"

The Argentine dog glanced over his shoulder, then whispered behind his paw: "I want to *bark."*

I heard the above anecdote in Brazil. It is a fair thumbnail sketch of the difference between the two countries. When Ticky was laying out our itinerary she planned only four days for us in Argentina on the assumption that four days was the longest she could possibly keep her mouth shut. I felt that she was overly optimistic; Ticky makes a vice of telling the truth. I simply hoped that Peron's police would be either too gallant or too cautious to throw a senora from the States into jail.

As it turned out we stayed much more than four days, as our ship, as is customary with ships, was much delayed in sailing. Then much to our surprise we found that we liked Argentina very much. Wait a moment, I do not wish to be mistaken for a crypto-fascist or whatever the communists these days are calling an authoritarian who is not a communist authoritarian. I do not like police states. Like the fat Argentine dog, no matter how good it is some ways I still like to bark. But we did like the country called Argentina and we liked the citizens thereof very much.

However I am going to say some fairly gentle things even about the present government of Argentina. I ask that it be kept in mind that I am simply trying to report what I saw and heard and that there can be qualitative differences between dictatorships, say between Argentina under Peron and Germany under Hitler. The observations made imply no approval of suppression of free assembly, of press, of free speech, of opposition parties, nor of the jailing of opposition leaders. As this is being written, Argentina has just held another election. Peron won it as usual and, also as usual, the opposition party, brought out and dusted off for the campaign, was promptly suppressed once the election was over. This is not our notion of free democratic choice.

But we received a very strong impression that President Peron enjoys a very wide popular support and probably could win an honest election by a good majority. True, he is not taking any chances. There have been several elections since he seized power and he has won all of them, but they have been much of the quality of an election in a social club which is dominated by a clique which controls both the nominating committee and the membership committee; the opposition might as well stay in bed—or over in Montevideo where a lot of them have taken up permanent residence in exile.

Nevertheless I think there are about as many Argentinos who like "Papa" Peron as there are of us who like Ike. As one of them told me, "Practically all of us like *him,* or at least most of the things he has done, but practically everybody hated *her."* I was not able to judge the latter half of his statement; Eva Peron had already gone to her reward when we were there and very few people mentioned her name. Not that one could forget her, for her name and her face were everywhere, but she was no longer an issue. But it did seem as if Peron were the prisoner of a myth he had helped to create. I do not see how he could marry again should he wish to do so. He set up his deceased wife as a *de facto* saint; it would be awkward, to say the least, were he now to many an "ordinary" woman.

I asked my informant why Evita was disliked when Juan was liked. "I'll give you a couple of examples. When Eva was a young actress she was beaten out for a part in a play by another and better known actress. She swore that she would get back at her. She did—when she became the President's wife she not only used her influence to keep the other woman from ever being cast for any part, she also drove the other actress right out of the country. That's the sort of senselessly vindictive woman she was and a lot of people knew it. Or take this case— A while back the girls that clerk in the department stores needed a raise, so the heads of their union went around to see Eva about it. She ran everything of that sort.

"She said she would think it over. Things went on for several months while she 'thought it over.' Then suddenly a raise was announced for women clerks, effective at once—but with the pay scale retroactive to the first of the year. A big bonus for the girls? Oh no! The accumulated difference was to be paid over into the Eva Peron Foundation; the clerks are pleased with the raise and they know who got it for them—Evita—and Evita has her hands on several more millions of pesos."

"Then she would spend it on herself?"

"Well, no— Yes and no. She *couldn't* spend very much of it on herself, no matter how many fur coats she bought. There was too much of it. But there never has been any accounting made of the money that goes through the Foundation, either where it comes from or where it goes. Evita used to give audiences in one room in the Foundation; people would file in and tell their stories. If the stories appealed to her, she would reach in a drawer that was stuffed with money and hand over fistfuls of the stuff—no system, no records.

"Mind you," he added, "I'm not saying the Eva Peron Foundation didn't do any good. It did a great deal of good and it still does. Hospitals, orphanages, all sorts of things."

I do not know how true the above stories are, but they seem to be typical of popular opinions. One of the odd things about Argentina, as a police state, was that the ordinary citizen seemed quite unafraid to talk about politics and to express criticism of the government. There is no possible doubt that the *Peronistas* have curtailed civil liberties and suppressed opposition, yet most of the citizens seemed to feel that they were free and well governed.

I do not understand this, nevertheless I will express a few horseback opinions—I can't be much farther off than are most professional pundits. I suspect that the typical South American is such a free soul that he simply will not stand for outright thought policing; if he can't speak his mind, he will rebel. Consequently a South American dictator can't get away with the sort of stuff that the commissars pull; the South American boss must seek real popular support to stay in power. Certainly Perrin has sought, and gotten it, from the "shirtless ones." He seems to have much middle-class support as well.

Besides that, Argentina does not have our firm tradition of civil liberty and democratic process; the citizen is more likely to judge results than methods—the "Mussolini-made-the-trains-run-on-time" school of political science. All through Buenos Aires we saw big signs: PERON CUMPLE—which freely translated means that Perrin keeps his word, Peron finished this or that public work just as he promised he would. This sort of thing makes an impression even in the States. The city I was reared in was dominated by the Pendergast machine; I can testify that my neighbors were more interested in the quality of the paving in their own block (which was good) than they were in the graft in the city hall concerning that pavement (which was scandalous).

In many ways Perrin looks good compared with his predecessors. We heard contemptuous remarks about the President he chucked out, to the effect that he spent all his time enjoying the night life of Buenos

Aires and never did any work. No one can accuse Peron of being lazy. His working day starts about six A.M. and almost anyone who wants a personal audience with him can get it if they will get up in time to see him at that hour.

His love for children seems to be sincere and it certainly adds to his popularity. He recently gave his country home to the children of Argentina, stating that a bachelor had no need of it. Everywhere in Buenos Aires one runs across this quotation: *"En la Nueva Argentina los anicos privilegiados son los* ninos."—President Juan Peron. ("In the new Argentina the only privileged ones are the children.") This boast is not entirely true by a great deal but he seems to be sincere in making it and it fits beautifully the temperament of the people; children are highly valued there.

In addition to the above he is a skilled spellbinder. We heard him speak once; his style was as effective as Hitler's. The content was a semantic blank; he was boasting that Argentina was a great nation because it had ideals and heart and such like vague abstractions. But at one point he stopped suddenly, changed his manner abruptly and snapped, "Tell those policemen to quit bothering the citizens and to go away!"

The crowd ate it up.

It might have been a spur of the moment inspiration of a talented public speaker, or it might have been a carefully prepared plant. Either way it was smart politics.

Now let's drop the subject of politics. It took us three hours to fly across South America and three more hours from touching down until we reached our hotel, what with entrance formalities and an interminable ride from the airport downtown. Airplanes have done half the job of making travel simple and fast; the other half remains to be done.

As we registered at the Plaza Hotel, we were politely told to surrender our passports; the police wanted them. Ticky firmly said, "No!"

The desk clerk was embarrassed, patient, and equally firm. I finally agreed that we would but insisted on receipts by the serial numbers of the passports, which the clerk gravely provided, as well as police cards for each of us. I have not the slightest idea what Peron's police wanted our passports for, but they kept them for several days, then returned them.

The Plaza Hotel is not as new as the Carrera but it is equally luxurious. Our room, a semi-suite twice the size of most hotel rooms, could be split into living room and bedroom by big drapes. The furnishings and decorations reminded me of the Mauve Decade but the beds were modern. The most startling item was the bath towels which were much too much of a muchness. They were enormous Turkish bath sheets, five feet by six feet, large enough to wear as a toga. I would wear myself out trying to get dry with one; I needed a flunky to hold the other end. A chunk cut off one end would have been much more practical. But after the modest scraps of water-resistant rag issued as towels in some United States motor courts I was not disposed to complain.

The next day was Sunday. The shops were closed and the streets deserted; we strolled and tried to get the feel of the city. Buenos Aires is a really big city, big as Los Angeles or Chicago and much handsomer than either. It is so large indeed that it is too large for its back country, from a standpoint of healthy economic balance. If New York City were proportionately large, New York would have *forty million* people.

But it is not surprising that most Argentinos want to live in the capital, if possible; it is a charming, beautiful metropolis, not an overgrown village in search of a soul like some of our own that I won't mention for fear of being lynched. It has more than two hundred parks and plazas, some of them of great size, all of them of great beauty, abounding in flowers and trees and statuary. I happen to be very fond of statuary and I have searched the United States from border to border and coast to coast, looking at statues wherever I could find them. It is a very poor crop. Why the richest people in the world who will willingly dig down in their pockets for anything from flood relief for Siam to a 21" TV screen won't pitch in together and buy statues I do not know—but there it is. Any city in South America is loaded with statues, some of them run-of-the-mill equestrian, some of them excellent, quite a few superb.

Buenos Aires being a big city has many statues, possibly more than its proportionate share. Most of them were academic in concept but in a large park near the President's city residence we saw something that looked vaguely like a ship, or equally like a giant prospector's hammer balanced on its head. It was heroic in size and conception and the shape was pleasing but I could not figure out what it was intended to be; I asked the guide who was with us at the time.

He smiled gently. "Uruguay gave that to us as a mark of friendship between our two countries, so we set it up here. But we never have been able to find out what it is."

On Monday it seemed time to get down to serious sightseeing. In any country for most travelers, such as ourselves, it is an always frustrating choice whether to see things haphazardly, enjoying oneself and trying to soak up the flavor of the country, or to set about it with grim determination to get the maximum use out of limited time and money. The first method is by far the best—provided you are wealthy in time and money and can afford to spend several months in each country and a lifetime in traveling. The second method is almost Hobson's choice for most of us, but it is hard work.

Ticky and I usually tried to do a little of both, which meant that we necessarily missed a lot of things. ("What? You were in Ruritania and you didn't see the *labyrinth?* My dear, you wasted your whole trip!") The world is a giant smorgasbord; you can sample a bit here and there with pleasure, but if you try to gulp down everything, you will simply become ill. It may be more important to visit with a cat and her kittens in an open-air book market than to try to see all the labyrinths in all the Ruritanias.

Ticky and I went down to the head porter's desk at the Plaza and asked if there was a taxi driver around who spoke English. We knew that Buenos Aires had a subway system that would get us anywhere faster and cheaper than would a taxi, but sightseeing from a subway is something like kissing over a telephone. The porter found us such a driver, a licensed guide named Herman Freudenberger, who was to become our closest friend in Argentina. He was a handsome, well setup young man and was a college graduate in ranch management, but he had given up agriculture to become a tourist guide. As he explained it, an assistant to the manager of a large agricultural estate has nothing to look forward to but the death of the manager; he wanted to get married and the guide business was quicker.

Herman spoke Spanish, Portuguese, English, German, and French; it was a rare tourist who could stump him. He had something else of equal importance: he loved his country, was proud of it, and knew its history. His parents were German Jewish; Herman was as Argentino as San Martin the Liberator.

He did not have his hand out. If we added a gift for special service he accepted it courteously, but if we paid the exact fare by mileage or time he was equally gracious, being at all times a Latin American gentleman and our host in his country, rather than a hired employe.

Herman took us first for a quick tour of the major points of the city. Let's take it for granted that we saw such things as Casa Rosada, the statue of San Martin, the monument to Columbus, embassies, ministries, Plaza Congreso, the Obelisk commemorating four centuries of Buenos Aires, the national art gallery; of course we saw such things and so will you when you go there. But you can learn more about such from five minutes of looking at pictures in the *National Geographic* than you can from ten thousand words of description. Describing a public building is as futile as describing a beautiful woman; the proper medium is a picture.

All of the above took more than one trip on more than one day; Buenos Aires is big. But we saw other things. Herman drove us down to the estuary to let us see the Dutch ship we were to sail in the following week. The waterfront in Buenos Aires is prettier than most, although docks and warehouses of a big and busy port cannot compete with other sights in beauty. But while we were there he gestured toward a big municipal steam-electric plant. "There is where we burned coffee during the War."

"Coffee?" I answered, thinking with horror of the present dollar-a-pound prices.

"Yes. We had coffee we couldn't sell or give away and we were short on coal. It gave the whole area quite an aroma."

I was too stunned to comment. It struck me as the most tragic waste of raw material since the time of the Aztec practice of sacrificing virgins.

Later he showed us Avenida Nueve de Julio, the widest street in the world. If you translate the name as "Fourth of July" instead of "Ninth of July," you end up with the proper local meaning: Independence Day Boulevard. It was certainly wide, making even Canal Street in New Orleans look like an alley—about eight taxicabs to a side, not counting broad, gardened parkways.

"How did it get so big?"

"Oh, President Peron decided that we needed a major boulevard through the heart of the city so he told them to tear down all the buildings in one row of blocks and merge the adjoining streets. Look at this."

We drove down a chute and found ourselves in an underground parking and service garage. "This is the biggest underground parking space in the world. This is where the Buenos Aires businessmen leave their cars during the day."

I was not prepared to dispute it; the caverns seemed to run endlessly on back until lost in the gloom. It accounted in part for what seemed to be a total absence of parking lots in downtown Buenos Aires and very few places to park at the curb. This four-hundred-year-old city was not laid out for automobiles. "But suppose they do park here," I objected, "that would still leave most of them a mile or more from their offices."

"Eh? Why, their chauffeurs drive them to their offices, then leave the cars here, then pick them up later."

"But how about those who don't have chauffeurs?"

"Excuse me? Oh . . . here in Argentina any man who can afford to own a private automobile can certainly afford to hire a driver."

I learned that the car he drove was not his own but was an investment on the part of a wealthy man for whom he drove it on shares. We were finding and were still to learn that the Detroit automobile is the most universally coveted piece of wealth in the world. In Argentina and in many other countries import of American cars is strictly controlled and a license to do so is hard to obtain; often it is a cherished piece of political patronage. Under these conditions a car from the U.S.A. is fantastically expensive, not just a mark-up for ocean freightage and tariff, but with the F.O.B. Detroit price tripled, quadrupled, even quintupled.

But even at such monstrous prices they are greatly desired; we were assured that, despite the cost, they were more automobile for the money than were the much cheaper European cars. A Ford or a Chevrolet will be driven "three times around the clock," more than three hundred thousand miles, and will stand up under it; a European car, except the Rolls Royce, will fall to pieces under much less abuse.

I am neither an automotive expert nor a field agent for the Detroit Chamber of Commerce; I report what I heard from drivers on four continents, many of whom were not especially friendly to the United States—in fact in many cases they seemed to blame us for the fact that their own governments had made it so hard to import American cars. The answer to this is tied up with the knotty question of dollar exchange and controlled currencies, but there is a potential market abroad for millions of American automobiles which we are not at present able to use.

Herman took us out to the cattle market, which looked much like the stockyards in Kansas City or Chicago and was comparable in size and in modern methods, Argentina being butcher to the whole world. The cattle were mostly big, beautiful Herefords, large square steaks with ears at one end and tail at the other. Being from cattle country ourselves, they were interesting but not novel. What did interest us were the gauchos and their horses.

Cattlemen are cattlemen, no matter what language they speak. While the gauchos looked odd in their dress to us their costume is as practical as the typical gear of our own cowboys. They wear baggy pants *(bombachas)* in place of Levi's and chaps, a different syle of sun hat, and different styling in their boots; these differences are no more significant than the differences in uniform and insignia between American Marines and French Legionnaires. Poncho and *bombachas* make a gaucho look fat; our western dress makes a man look leaner than he is—no matter, they are both colorful and dressed for the work they do.

But their horses are not like our dainty, little cow ponies. The gaucho makes little or no use of the lasso; he has instead the *boleadoras,* three strands of braided rawhide bent together at one end of each and with a metal weight fastened to each of the other ends. He can swing this over his head, let it sail through the air, and bring down an animal by tangling it around the beast's legs from a greater distance than is possible with a lariat.

But the gaucho does not use even this tool very often against cattle, but saves it for ostrich or simply for hunting for sport. They believe in treating cattle gently—no sense in subjecting a cow brute to a spill and a nervous shock when you are trying to fatten it for market. Their horses are bred short, wide in the chest, and heavily muscled; they are trained to manage cattle by breasting against them, nudging them the way they want them to go.

Later we discovered that the cattlemen of Australia do not use any sort of rope. If an Australian cowboy finds it necessary to throw a steer for any purpose—which is not often—he will ride up to it, reach down and twist its tail and trip it. Australians do not use the lariat either. Nor did we see any roping equipment being carried by the cattle hands in South Africa. I begin to wonder whether or not the proud art of the American rodeo might not simply be an obsolete stunt, about as useful as rapier fencing. Maybe we shake a lot of hamburger off our brutes unnecessarily just to show how clever we are with a rope.

I risked my pretty business suit and tried the gaucho saddle. The horse turned out to be neck-reined, but he did not speak English and the gaucho uses both quirt *(rebenque)* and heavy spurs so I did not stay up long. The gaucho saddle is nothing like a western "rocking chair" stock saddle; instead of sitting down in it you sit up on top of it and it is built like a feather bed, with layer after layer of blanket, sheepskin padding, and leather. There is so much between the rider and the cayuse that it is hard to feel the beast. I like to be more intimately in touch with a horse if he and I are expected to form a close committee, not separated from him by an innerspring mattress.

The saddle had stirrups, big metal disks with boot-size holes in them, but I could not see that they did much good; they seemed simply to let the gaucho know where his feet were. They are derived from a much simpler stirrup, a rawhide thong tied around a small stick. The gaucho of the early days placed his toes over the stick with the thong between his big toe and the second toe; it served as a stirrup but it did not look as if you could put much weight on it in a pinch.

Herman pointed out this oldstyle stirrup on a statue titled *El Gaucho* which stood in a little park in front of the main entrance of the stockyard. It was a beautiful piece of work, comparable in artistic quality and style of execution to "The Scout" or "The End of the Trail." The sculptured horse looked like the same wide-shouldered, chunky little animal that had just patiently let me try him, but the gaucho portrayed was of an earlier century with a strong, hardbitten Indian face unmodified by European blood.

Herman pointed out his boot, which came all the way up his calf but did not cover his toes at all. "When a horse died the gaucho would make two circular cuts in the hind leg above and below the hock, then he would strip off the hide as an unbroken cylinder the way you would peel off a stocking. Then he would put it on his own leg, with his heel at the hock joint and let it dry and shrink in place; this made him a new pair of boots."

Ticky examined the statue. "But how would he take it off?"

"He didn't, not until he cut it off to replace it with a new one. Those oldtimers lived very much the way the animals themselves did. They slept on the ground in all sorts of weather, they never washed, they never took off their boots. They were a tough breed."

Ticky looked at the portrayed boot with the splayed toes sticking out, wrinkled her nose and turned away—Ticky used to bathe fourteen times a week until her doctor made her cut it down to once a day. I myself was wondering just what sort of athlete's foot would be incubated inside a rawhide boot that was never removed, but decided that the tough hombre sitting up there would never have noticed anything short of gangrene.

That afternoon Herman took us to see a very special sort of school, Escuela Pedro de Mendoza. It is the home and studio of Maestro Benito Quinquela Martin, possibly the greatest living Argentino painter; it is also an art museum, a grammar school, and an art school. Senor Quinquela was a very poor boy in the waterfront neighborhood, a wharf rat. From his paintings, now sought by all galleries everywhere, he has become wealthy, but he lives and works in the poor neighborhood where he grew up. The *escuela* is a beautiful modern six-story building by the water; the Maestro owns it, pays the expenses, pays the salaries of the staff of teachers. The poor children of the neighborhood attend free.

A child who attends is not especially likely to become an artist; it is in most respects simply a well-run grammar school. But a pupil there who happens to display artistic talent has every opportunity to study art under a renowned master. Senor Quinquela named the school for the artist who gave him his chance, Maestro Pedro de Mendoza.

One of the pleasant things about the place is that the museum is loaded with works of other living Argentino artists, purchased by the Maestro. Besides that, he has named each classroom for some earlier artist of the Argentine. We did not get to meet Senor Quinquela (although he is readily at home to casual visitors and tourists) because he was away, but his benign personality was everywhere. His favorite subject is still his own poor waterfront neighborhood and so high is the regard in which he is held by his neighbors that all around us we could see that shopkeepers and warehouse owners and householders had painted their properties in bright colors—because the Maestro likes to paint bright colors in his pictures!

Each classroom has a mural done by the Maestro—a feature that may be more impressive if I add that his pictures bring twenty to thirty thousand dollars in the open market. Each grade is decorated appropriately for the age level, starting with Bugs-Bunny-Mickey-Mouse things in the kindergarten. For these small children each door in the part of the school they use is done in a different color, so that a child too young to obey, "Go to room nineteen," can be told, "Go see Senorita Gomez in the room with the red door."

We left the place feeling happy.

I took advantage of where we were to ask to see slums. Buenos Aires turned out to have the cleanest slums we ever saw. They were still slums, substandard dwellings for the very poor, but they were swept and washed and painfully neat, with never an uncovered garbage can, nor a trash heap, nor a bad odor. President Peron decided that all citizens must be clean, so he made each local policeman responsible for the cleanliness of his beat, with his responsibility extending even to compulsory inspections of housewives' kitchens. A housewife can be fined for failing to wash dishes, failing to scrub floors, failing to keep her yard, or passageway, or stoop clean and neat. The results are homes which are clean and healthful and cheerful, though still poor.

I could not help wondering what would happen in tenement neighborhoods in our country if the local cop tried to inspect the kitchens. What would they do to him? Take his club away from him most likely and beat him to death with it—and good riddance, too.

There are other things more important than cleanliness.

In Buenos Aires as in all Latin American cities I have been in there is a nerve-racking din of automobile horns. I had heard that the system was that the first driver to sound his horn had the right of way, which naturally would result in endless horn-blowing and probably endless accidents.

Only it did not result in endless accidents. I asked Herman about it and was told that I did not quite understand the system; it was not a race to see who could toot his horn first. Each driver, as he approached an intersection, gave a short blast on his horn at about the same distance from the corner, around forty feet. Thus the signal of the driver nearest the corner would be heard first and cars coming at right angles to him would give way.

The system seemed to me to be chancy in the extreme but it worked, although the racket was distressing. However, Buenos Aires was quiet as a chess match at night, whereas Santiago was so noisy at night that we could not have gotten to sleep early even if the schedule had permitted it; I asked Herman about the contrast.

"Oh. See this." He flipped a switch on the dashboard. "Now the horn is disconnected and the horn ring flashes the highway lights. President Peron decided that people ought to be able to sleep at night. So at sundown we all flip this switch, drive with the dim lights in the city, and use the bright lights to signal at each corner just as we use the horn in the daytime. It's a fine if you sound your horn at night."

Herman collected parking tickets just as many American drivers do; his business almost required it. At the moment he was not paying them as there was a Christmas amnesty coming up and he expected that the slate would be wiped clean. The notion seems exotic to us; later we were to run into a much stranger use of amnesty in Brazil. In accounts of automobile accidents in Brazilian newspapers the same sentence frequently ends such news items: "Both drivers fled from the scene."

With us, leaving the scene of an automobile accident is just short of carving up your wife with an axe. Not so in Brazil. The courts are years behind in their work; if a driver is arrested on a charge of causing an accident he may wait in jail almost endlessly before he can be tried; therefore he runs away and tries to avoid arrest.

The wonderful part about it is that if he manages to keep his freedom for twenty-four hours amnesty works; he will never be arrested. I am not sure of the law or lack of it in this custom; it may be just a well-understood convention based on the common knowledge that the courts could not possibly in all eternity handle all the cases if the cops arrested everyone who deserved it. In any case, the drivers do run and hide.

Amnesty in misdemeanors and lesser crimes does not seem so out of place in cultures in which amnesties for revolutionists, political prisoners, and exiles are common and almost a necessity. The spirit of forgive and forget makes some of the fiercer aspects of Latin ways more tolerable.

We heard of one other custom much more wildly exotic. I was not able to check on it as it referred to Paraguay, a country we were not able to visit. But here it is: it is alleged that Paraguay has no law against murder, killing being considered a private matter; either the deceased is a no-good and everyone is glad he is dead, or the friends and relatives of the departed can be depended on to avenge the matter themselves.

My first impression was one of horror, but the idea has a certain wild logic about it that grows on one. Almost anyone can make up a list of people he would like to lure into Paraguay—they never would be missed.

We did not spend all our time driving around with Herman although it would have been cheaper for me. The Plaza Hotel is at one end (the more expensive end) of Calle Florida, one of the finest shopping streets in the world. During the business day it is blocked off from traffic and shoppers can wander back and forth as they please.

Ticky is the sort of girl whose eyes bug out and whose face gets flushed at the sight of bargains in a shop window—somewhat the expression that Marilyn Monroe produces in a man; it may be a related mechanism. The greatest hazard in Calle Florida is the alligators, empty ones made up into women's handbags; they are snapping and yapping at a man's financial standing every step of the way down the street. They will savage you in a tender portion, your wallet, at the drop of a hint.

It is no good to tell me that a handbag is "cheap" at thirty-five dollars simply because the same handbag would be priced at a hundred and fifty dollars in New York; if I were in the States I would not be buying a handbag for any century and a half—nor for thirty-five dollars either if I could avoid it; my cornbelt ancestors would spin in their modest graves.

Ticky was moderate; she bought only three alligator bags.

Of course each bag had to have shoes to match. Besides that they were actually giving away (almost) bags of other sorts. Then there were sweaters and blouses and gloves and other things. I kept reminding her that we had been sixty kilos over the weight limit in flying the Andes and that we were going to have to pay excess air baggage several times more; I don't think she heard me.

Once I had anesthetized myself to the inevitable it was really pleasant to see her have so much fun. For most women, to be in Calle Florida is something like dying and going to heaven. So far as I have seen or ever heard nowhere else in the world are there so many smart shops catering to women jampacked into so small a neighborhood. Add to that the fact that a favorable rate of exchange makes any purchase a bargain (in feminine logic) and that many things really are wonderful bargains by any standard.

I offer this hard-earned advice to others who may follow: give her a flat amount and take her traveler's cheques away from her. Tell her solemnly that when the amount is gone the fun is over. Then stay in your hotel room, quietly quaffing San Martins and thinking serious thoughts; if you go along you will be tempted to let her have more money.

I went along, of course.

Ticky encountered for the first time the custom of dickering. She was no good at it, as she believed instinctively that it is immoral to attempt to get anything below the asking price, equivalent to taking bread out of the mouths of the shopkeeper's hungry little ones. But she finally got it through her head that, except in the large department stores that advertise "firm prices," each sales transaction in Latin America is a social event, more valued for the ritual than for the regrettable economic aspect. But she never did acquire any skill at it. Fortunately most sales people are not disposed to swindle a senora, even if she is from Estados Unidos and therefore conclusively presumed to be rich.

She encountered, too, the lovely custom of making the purchaser a little gift after the transaction is over, and was delighted with it. So am I, for that matter; it is probably an uneconomic practice that results in higher-than-necessary prices, or profits lower than proper, or both, but it does not cost much and adds grace and warmth to life.

In the course of an afternoon's shopping it was necessary to stop for tea. By "tea" I do not mean a cup of lukewarm tannic acid solution with skimmed milk added; afternoon tea in Buenos Aires is somewhat simpler than a Thanksgiving dinner, but not much. The place to go is a *confiterta—which* should not be translated as "confectionary shop." (Knowing little or no Spanish I often tried to struggle along through translating by cognates, as indicated above; this can lead to trouble. In a cocktail lounge in our hotel I saw a sign which seemed to me plainly to read: NO PROPAGATION PERMITTED IN THIS ROOM—which seemed to me a reasonable restriction, even in a broadminded hotel. I learned later that it read: NO TIPPING. And it did not even mean that.)

A *confiteria* is a combination soda fountain, cocktail bar, tea shop, and restaurant, usually with live music and other elegances. The best are as swank as the Stork Club; our favorite had the end of the room caged off and filled with dozens of song birds which sang along with the strolling musicians. Around four-thirty or five in the afternoon entire families gather in them, Papa has his highball, Mama has tea, the kids have sandwiches and cakes and malted milks and ice cream sodas or anything they wish. We have no institution for the entire family which compares in wide choice of hospitality, but it is high time we imitated it. We won't of course; the bluenoses would have fits —corrupting the young, and so on.

Ticky and I always picked ice cream sodas, French pastries, and fancy little sandwiches. I had always thought the soda fountain was "Made in U.S.A." and perhaps it was, but our neighbors can teach us some tricks, in particular the "Everlasting Soda" as we called it. The first time I ordered a soda I was fetched the usual large glass, but, while it was packed with ice cream, whipped cream, and crushed strawberries, it contained no bubbly water nor very much room for same. Instead the waiter put a quart seltzer bottle with squirt top down by it.

I was charged a very modest price for one ice cream soda, but it took me more than an hour to finish off the combination. I did not use all of the fizz bottle, of course, but whenever the glass ran a little low or a bit flat I gave it a transfusion. When it was over and we were looking regretfully at the quantities of sandwiches and pastries we had not been able to eat (even though we had made marked inroads), the waiter came along, noted that we had not eaten everything—and reduced our bill accordingly.

It cost us forty cents each.

Most of one morning was killed by a newspaper interview and a radio broadcast. I usually try to duck such chores, as my voice over the air sounds like a rusty saw and, as for news stories, I am leery of any copy that I do not proof myself. I was more anxious than I would be at home to avoid both of them as a foreigner's remarks are likely to be held against his nation, whereas if he waggles his jaw at home his boners reflect on no one but himself. I don't have a diplomat's special training in how to walk a tight rope and I certainly did not want to be an international incident, even a minor one.

I pointed out to the radio chap that I did not speak Spanish. No matter at all, he informed me; it was the government Servicio Internacional, the Argentine equivalent of The Voice of America, beamed in shortwave in six languages. This made me more edgy than ever, so I protested that I had a very full schedule (which was a lie, unless you counted in *confiterfas);* I did not have time to come to the studio.

Oh, they wouldn't think of asking me—a crew would come to the hotel with recording equipment. I gave up and scheduled both for the next morning. The reporter arrived first and could not speak English, which almost gave me an out, except that the redheaded Irish maid was in the room; she pinch hit and made an excellent interpreter. Presently Herman showed up and we were able to let the maid get back to her work.

Instead of translating one question Herman started to argue with the reporter. Presently he turned to me and protested, "He insists that I ask you how much money you make a year."

"Tell him I won't answer that one."

"I *told* him that that was a question no North American would answer, but he insists on its being put."

I thought about it: "Tell him I really don't know, that my business agent handles such things. Tell him that I am just a writer with no head for business."

"Okay."

The men from the broadcasting station showed up and started stringing wires around; the reporter closed his notebook and left. An outline had been prepared and most of the items were innocuous enough, things I could discuss without offending anyone. But it was strongly suggested, orally, that I really should finish up by saying something really nice about "Papa."

I did not want to say anything about President Peron, pro or con; a tourist who sticks his nose into politics is asking for trouble, for himself and for his country.

They did not twist my arm but it was very hard to refuse. I tried to think fast without much success—then suddenly remembered the sign we had seen all over town, the one about the kids; it was as nonpolitical as apple pie, as noncontroversial as being in favor of good roads and good weather, but it was a direct quotation from President Peron.

So we finished the broadcast with that, quoting it in both English and Spanish: "In the new Argentina the only privileged ones are the children." I said that was an ideal that appealed to all nations, and wiped my brow as the little red light went out.

In the evening paper I saw that I had stated that no atomic blast could destroy the Earth, which was fair enough; I believed it, it was consonant with our own national stand in the matter, and more or less what I had actually said. I saw also that Ticky and I planned to return home via the North Pole, which was a lovely notion, though not true, but it hurt nothing. Further down I discovered that I made so much money that I could not keep track of it but was satisfied as long as I always had money enough for beautiful cars, enough to take care of my mansion in Colorado, and enough always to travel where and how I pleased.

Well, I suppose I asked for it. Stated as ambitions rather than as accomplished facts it was not too far off the mark.

My present car is getting a bit old and the house needs some repairs. It would be nice to have too much money.

I asked Herman about it the next day. "Oh, you wouldn't answer so he filled in what he needed." He frowned. "Things are different here. They should have sent a reporter who could speak English and who understood North Americans. Here one of the first questions a reporter always asks a man is, 'How much money do you make?' and the man being interviewed always gives a flat answer: 'I make such-and-such thousand pesos a year.' It is a polite question and a perfectly proper answer."

"Not in the States."

"I know. Although some of your Texans don't seem to mind."

"Well . . . Texans are a special case. They have their own rules, more like yours."

"Yes, but not quite. Just recently there was one in that hotel you are in. He wore one of those big hats and high-heeled boots and he was boasting about how he could paper his hotel room with thousand-dollar bills if he felt like it."

"Hmm . . . one or two too many San Martins?"

"He may have been drinking but I don't think so. It was in the daytime and he called down to the desk and told them to send up thirty thousand pesos in change; he was buying some things for his wife. Then he got angry when they didn't do it."

I had no comment. Herman went on, "I've noticed that my guests from the States often mention proudly that they were poor boys. You said something like that yourself."

"Yes."

"I've learned that it is something that a North American is proud of. Here, if a man has become wealthy from poverty he tries to keep it quiet. An Argentino likes to boast, if he can, 'My father and my grandfather left me so much money that I can have everything I want and never have to work.' "

At a later time I ran into a confirmation of this major difference in attitudes. I was at a social event with an Argentine minister of state who had once served his country in New York City. He was speaking to someone else but turned to me to have me confirm something he said, in that I was the only "Yankee" present. "I was telling so-and-so that my salary in the States was three thousand dollars a month and that that was a very good salary there. That's true, isn't it?"

I assured him that thirty-six thousand dollars a year, tax free, was a very good salary anywhere. He seemed very pleased.

To our regret the morning arrived when we went down to pay our bill. When we got back to our room it was dominated by an enormous bouquet of flowers; the card attached read: "Bon voyage, from your friend and guide in B.A.—Herman."

Herman took us down to the ship, got us smoothly through outgoing customs, loaded us aboard with advice as to tipping the dock porters, then took us back uptown. We had lunch with him rather solemnly and he took us back to the ship. Shortly the M.S. *Ruys* warped away from the dock and out, side bedecked with streamers and band music playing. I found my eyes filling with tears, something I had surely not expected to have happen at leaving "Papa" Peron's too-well-policed paradise. I looked at Ticky and found that she was having the same trouble. She looked at me and said, "We *will* come back, won't we? You weren't just kidding Herman?"

"You bet we will!"

V

The Good Little Country

THE MOTOR SHIP *Ruys* intimidated us at first. It was big and shiny and beautifully furnished and filled with well-dressed people all of whom seemed to know each other and who laughed among themselves and stared right through us. The officers wore gold braid and crisp white uniforms and answered questions politely in correct formal English but were obviously too busy for us to bother them with our trivial affairs. We found ourselves homesick for the good old raucous, comfortable *Gulf Shipper*.

But the beds were comfortable and our stateroom had a polished, spacious perfection. Our bathroom had both a shower and a full-sized bathtub and was roomier than many ashore. There were two wash basins and many mirrors and a large divan and two wardrobes and enough stowage space to put all the ten suitcases out of sight, as well as lots of drawers and shelf space.

Our cabin steward, Kwai Yau, had arranged Herman's mammoth gladiolas in a vase in front of triple mirrors on the dressing table, making the room cheerful as well as luxurious. Kwai Yau could give Jeeves pointers on how to take care of people, but we were yet to become acquainted with his virtues. We showered and changed and decided to face the outside world.

The *Ruys* is the flagship of the Dutch Royal Interocean Lines. "Royal" is a decoration awarded by the Queen in honor of the many ships of the line—more than half—lost in war service. The *Ruys* herself had a long and honorable war record but came through intact. She and her sisters now ply between South America and the Far East, via the Cape of Good Hope and Singapore. She is neither a passenger ship nor a freighter, but a cargo liner, which means that while she carries a great deal of cargo, more than the *Gulf Shipper,* she carries also hundreds of passengers of all three classes.

Such a ship carries only a hundred-odd first class passengers but it offers them greater luxury than do the fashionable giants of the North Atlantic run. In a cargo liner all first class rooms are outside rooms and they are usually bigger than those in a passenger liner. There is plenty of deck space for games and walking and sunning, the swimming pool is never too crowded, there is always room to sit down in the bar, one never has to rush to find a seat at the movies—whereas many so-called luxury ships are crowded as cattle cars.

Second class in a cargo liner is comfortable but not fancy. The less said about third class the better; the best you can hope for is that it be clean. In the *Ruys* it was clean; I have seen some that were filthy.

To our surprised relief the operating language of the *Ruys* was English. The officers were Dutch, the crew was Chinese. Dutch was spoken only by the officers in private; the passengers never heard it. The Chinese petty officers all spoke English and it was this which caused the Dutch officers to manage the ship in English, it being the only language in common with the crew. Most of the other Chinese spoke some English or Pidgin (Kwai Yau spoke excellent English, in which we were fortunate; some of the passengers could communicate with their room stewards only through the petty officers).

Nine tenths of the first class passengers spoke English; there were only a few who had only Spanish. Our days of struggling to make ourselves understood were practically over. There were more South Africans aboard than there were South Americans, and there were only a handful of others, such as Ticky and myself—a few from the Far East, from Australia, from Mauritius, and one other couple with United States citizenship but who lived in South America and kept rather much to themselves. We were the only residents of the States aboard.

It seemed rather lonely for a day or two. We crept out of our stateroom that first day, got lost—the *Ruys* is big enough for that, until you establish landmarks—finally found the bar and ascertained that our signatures would be honored on chits. The bar seemed gloomy as a monastery at first, impressive with carved wood and dark beams and brass. But the drinks contained authentic joy juice. When the dinner chimes sounded we were better able to face it.

The dining saloon was two decks high, with an open, railed well above it and a leaded sky light. It is entered by sweeping, curved stairways which call for music by Strauss and is a place with crisp linen and shining, superfluous silver. The Chief Steward asked our names in a hushed voice and ushered us in slow march to a table; the head steward and the assistant head steward seated us. About then I caught sight of Kwai Yau standing in the background; he caught my eye and grinned. I felt better.

We introduced ourselves and found that our four table mates were all from Buenos Aires—Senor and Senora Rubenstein, two unrelated senoritas. All but Senor Rubenstein spoke English; he spoke Spanish and French and we could struggle along a bit with him in a sorry mixture of both. The fact that we had just been visiting in their home town loosened things up a bit and we got rather chummy.

But we never did get the hang of South American table manners and remained intimidated by them as long as we sat at that table. I have no apology for our own national table manners; in my prejudiced opinion most of us conduct our self-stoking sensibly, neatly, and unobtrusively. I don't see why a soft-boiled egg *must* be eaten from the shell.

But have you ever seen a well-bred South American tackle a piece of fruit? It is an exhibition of surgical virtuosity which would take me a long time to learn, if ever. One of them will tackle an apple, an orange, or a banana with a fruit knife and a tiny fork, peel the fruit and demolish it without ever touching human skin to any part of it. Consider what this means with a banana, for example; under the rules you can't even help yourself with your thumb to get the peel started. "Untouched by human hands."

They cope with a melon in much the same aseptic way, instead of steadying it with the left hand the way we do and spooning it out.

Ticky and I admired these stunts but were scared off by them. We did not eat much fruit that stretch of the trip.

Montevideo lies less than a hundred and fifty miles down Rio de la Plata from Buenos Aires; we were there in the morning. The estuary is about thirty miles wide at Buenos Aires; at Montevideo it is more than a hundred miles wide and is practically open ocean although technically still a river. It was here that the British chased the *Graf Spee* almost up onto the beach and fought a naval battle well inside the legal borders of Uruguay, for which they paid an indemnity and an apology with their tongues in their cheeks; the *Graf* was not a prize to let slip on a technicality.

The usual boarders swarmed into the ship before we were up. We arranged a tourist trip before we went to breakfast, as the schedule of the ship permitted but two days in Uruguay and there was no time for leisurely poking around. Senor Roitman, guide, interpreter, and host-by-temperament, agreed to have a car waiting for us and two others after breakfast.

The other two were an English lady (I use the word intentionally) and a shaggy young gentleman from the Canadian diplomatic service who had that careful carelessness in his appearance which characterizes the "top drawer." We found both of them extremely "veddy, veddy" at first. But I knew from other experience that the English are not actually unfriendly; they are merely shy, embarrassed, rather afraid of strangers. Ticky and I firmly ignored the chill they handed us and went on being friendly, informal, and talkative; it worked, as it almost always does. Almost all Englishmen are nice people individually, once you get past their guard, and they are quite willing to decide that you are a nice person, too—for a Yank, that is.

Montevideo is a large city, as big as Saint Louis. The first impression of it is its cleanliness. Underlying this surface impression is a standard of real sanitation as high as any in the world and higher than that of many of our own cities—Philadelphia, for example. You need not fear the water nor the food in Montevideo; they are clean.

The second impression is one in reverse: no policemen. This negative condition probably would not have impressed us had we come directly from home, since we don't see many policemen at home and the few that are seen are usually controlling traffic. But in most of Latin America a cop or a soldier (they are much the same thing there) is always staring down the back of your neck. They won't bother a gringo tourist ordinarily but they are always there, as ubiquitous, conspicuous, and depressing as a chaperone on a hay ride.

There probably are some policemen in Uruguay but I do not recall seeing a single one even though I looked for them. I don't think you could stir out a policeman in Montevideo even by parking in front of a fire plug.

I asked Senor Roitman about this and he got straight to the (Latin American) point. "Our President doesn't need any bodyguards." We were seated at the time in a sidewalk café; he glanced across the plaza and added, "In the afternoon when he finishes his day's work he comes out over there and walks across the plaza alone. He runs across you and you know each other, so you sit down right here with everybody else and you have *café expres* together. Nobody takes any notice; it wouldn't be polite."

The President of Uruguay is not the boss and he most certainly is not a dictator ruling by decree; the system resembles the Swiss system in that he is chairman of an executive council. I do not recall the name of the incumbent, as his name was not plastered all around in public places as in Argentina.

The third impression was the usual one in South America of parks and plazas and monuments and outdoor statuary. I had assumed up until then that the superior beauty of South American cities was a result of age. But Montevideo is a mere youngster, founded in 1726, more than a hundred years after the founding of New York. Where are New York's statues and monuments? Not that thing over the pond at Radio City, surely? And don't mention Grant's Tomb; I've *seen* Grant's Tomb. They shouldn't do it to a dead man.

My passion for statuary almost got me into difficulty. We were driving through one of the many parks and passed their monument to the Covered Wagon; I insisted on stopping for a good look. It was a fine academic bronze, a lifesize group consisting of covered wagon, pioneers on horseback, triple span of oxen, relief oxen following behind, all executed in detailed realism which nevertheless achieved satisfying composition from any approach. It was an opus suited to crown the career of a great master and it made much "modern" sculpture look like the kindergarten blobs so many of them are.

I was interested in it from three points of view: as a work of art, in the strong parallel to our own pioneer history portrayed by the group, and in the mechanical and engineering problems which in a thing of that size are as difficult as the artistic problems. I stepped up onto the base of the group to take a closer look at one of the figures.

A park attendant sprang up out of nowhere and informed me emphatically that it was *prohibido* to molest the statues. I tried to explain most humbly that I had not meant any harm and that I had not touched anything but my frail Spanish broke down completely and Mr. Roitman had to intervene. He made himself personally responsible for my good behavior and I left sheepishly, under parole.

I suppose the park attendant could be classed as a policeman but he was armed with a rake instead of a gun.

We drove for many miles through the old city and through the new city which spreads downstream along Playa de Carrasco. Much of old town was rococo in style, even baroque, but in Carrasco we found miles of the lighthearted, imaginative modern architecture which we had first noticed in Lima, then had encountered repeatedly in Chile and Argentina—and were to encounter again in Brazil. I again asked to see slums, sticking to my theory that a worm's-eye view of a culture is the only one with a true perspective.

Mr. Roitman did his best to oblige. Presently I said to him, "When do we get to where the poor people live?"

He stopped the car. "This is it."

I looked around and said, "No, no, I mean the *really* poor people," then explained what we had seen elsewhere.

"But these *are* the poor people. These are the poorest people in Montevideo."

I looked around me again and was tempted to call him a liar. These were not tenements nor the hovels of the poverty-stricken; these were small and simple single-family houses, each with its flower garden, quite evidently the homes of self-respecting lower-middle class. I already knew that Mr. Roitman was proudly patriotic and I suspected that his national pride had caused him not to show me the seamy side of his city. My own home town of Colorado Springs has little poverty and its slums are not slums at all in the sense in which the word applies to New York, Chicago, Rio, or Sydney, but I knew and was graveled by the knowledge that the worst of Colorado Springs was depressingly worse than this by many stages.

Unsatisfied, I checked on him later. Senor Roitman was right; these were their "poor." Uruguay has no poor. It is a welfare state that works, without, so far as we could see, the dreary drawbacks of other welfare states. How they have managed this I do not know, for I have seen other welfare states which appeared to have much the same sort of legislation and the results I did not like at all—repressive laws, endless bureaucracy, chain gang regulations. Uruguay is not that sort of a place, yet it has cradle-to-grave social security, free education through college, free medicine for the lower incomes, and retirement at fifty without loss of comforts for anyone who wants to retire that young.

Maybe there is a catch in it; if so, we did not find it. Our investigation was as quick and superficial as a congressional junket to Europe; nevertheless I am for the present convinced that they have somehow managed to work a miracle. Someday I plan to go back and dig in deeply; if there is a secret to be learned, we must learn it. Just now I feel strong sympathy for the farmer who said on seeing the giraffe, "There ain't no sech animal!"

Uruguay has the Latin fondness for designating famous events simply by their dates. (Was it Mark Twain who said that a French politician could make an impassioned and effective patriotic speech simply by rattling off a list of dates?) In driving around I noticed the following street names: 14 July, 18 July, 25 May, 26 March, 4 July, 31 December, and 24 September. This is a random sampling, not a complete tally; they may have the calendar (and their streets) as loaded up as we are with Mother's Day and Chew-More-Gum Week.

Note that they complimented us with a street named for the Fourth of July, our only holiday that fits into the date system. This sort of gracious gesture is to be found throughout South America; one is always coming across Woodrow Wilson Boulevard, Roosevelt Highway, George Washington Plaza—nor is it a matter of toadying to Tio, for they have not neglected the national figures of other nations besides ours. I wonder to what extent, if at all, we return these courtesies? I have never run across at home Bolivar Boulevard or San Martin Road. Perhaps I did not look in the right places.

While all of our neighbors to the south follow this gentle custom Uruguay really goes whole hog. Here are a few samples: Avenida Simon Bolivar, Rambla Republica de Argentina, R.R. de Peru, Rambla Presidente Wilson, Calle George Washington, Parque Franklin Delano Roosevelt (the biggest one in the city), Rambla Presidente Bernardo O'Higgins, more ramblas named for Mexico, Chile, France, and Great Britain (a *rambla* is a fancy boulevard, one with trees and flowers and a view), Avenida Italia, Avenida General San Martin, and even Calle Missouri and Calle Mississippi. After that comes heroes, heroes, and more heroes; they rarely waste a street by naming it something like Chestnut, Pine, or Fifth.

A man can get into their street guide without being a general, a politician, or a Uruguayan celebrity. Emile Zola and Herbert Spencer both made it; you can too. So did Darwin, Cervantes, Clemenceau, Magellan, and somebody named Samuel Blixen. Go climb a mountain or write an epic poem; eventually the city council of Montevideo will award you a few miles of paved immortality.

I think that the only word for this custom is "gracious."

The following morning we drove out to the cattle market, which differs from that in Buenos Aires in that it is some miles outside the city and affords thereby more opportunity to see gauchos at work. It still is not real cattle country, which is farther to the north in the great plains; the countryside around Montevideo is more like Iowa farms, except that some of the vegetation is subtropical. It never frosts in Uruguay, but there are not many really hot days and there is enough rain, around thirty inches a year over all.

I could not see much difference between the gauchos of Uruguay and the ones of Argentina, but their horses here seemed to be finer boned with more Arabian strain and so far as I could see they were not taught to breast the cattle. Representatives of the major North American meat packers are stationed permanently at this cattle market and buy a large portion of the supply, this being their major export to us. We "took mate" with them and the gauchos in the gauchos' clubhouse at the market—"tomar mate" is the idiom, literally "to take the pot" but it means to drink *yerba* herb tea through a silver pipe from a gourd pot called a "mate." Socially it means still more; it is the Uruguayan symbol of hospitality.

Custom requires that all in the same circle of friendliness drink from the same pot and the same silver pipe. The English lady with us was offered it first, then Ticky, and then myself, after which it made the rest of the rounds. There is a belief that germs cannot live on the hot silver pipe, that it is self sterilizing. I hope that the belief is true, for the rite is as unavoidable as kissing the bride.

Mate is not unpleasant, being much like green tea, but it is an acquired taste. Uruguayans and Argentinos set much store by it and believe that it is food, drink, and vitamins all wrapped in the same package. There is a story of a besieged garrison that lived for weeks on mate alone. The story is almost certainly true but I would find it a thin diet.

Returning from the cattle market we drove to the top of the Cerro. This is the mountain from which the city got its name: Montevideo—"I see a mountain." There is an old fort there which once dominated the harbor; now it is an historical museum and Uruguay, very sensibly for a country of three million people, simply has given up competing in the military arms race. Mr. Roitman pointed out an island to us in the harbor spread before us and referred to it as the "political prison."

I jumped on the remark. "I thought this was a land of freedom? No political prisoners?"

"Oh," he said, "that is what it used to be, more than a century ago, when the Spaniards ran things. It is empty now, just a landmark."

I thought of the anti-Peronista refugees in Uruguay and looked out across the water at Argentina, invisible but close over the horizon.

"Aren't you a little afraid that 'Papa' may come over someday and change all that?"

He smiled grimly. " Papa' would like to—but he knows we have an 'Uncle.' "

Later on that day Ticky and I were walking alone down Avenida 18 de Julio, the major shopping street. We were much surprised to hear a cheerful voice say, "Hello! You're Mr. and Mrs. Heinlein."

Facing us was a handsome young chap with a wide smile on his face. He was not one of our fellow passengers, I was fairly sure, and we knew no one in Uruguay—but his face was familiar. I shook hands while saying, "I *know* we've met you, but I can't for the life of me remember where or when."

"Don't you remember? The little dog?"

On the day before, Ticky and I had been seated in a sidewalk café in Plaza Independencia. Near us was a party of people and with them was a little butterfly spaniel bitch. Ticky offered the spaniel peanuts and a potato chip or two. The international amity established with the dog soon extended to the dog's people and we chatted between tables with them. They were a family party, father, mother, and grown son; the two men could speak English.

The encounter was most casual, hardly more than mutual agreement that Primavera was a fine doggie, yes indeed! We did exchange names with them but the chat lasted no more than live minutes; there was no intention nor expectation of following up the brief encounter. We had simply patted their dog.

I had hardly noticed the son. His mother was a woman of extraordinary beauty; my choice in such circumstances is not a choice but a reflex. I had looked at the men in the party just enough to be polite—I *hope* I was polite.

But when the young man who stopped us on the street said, "Don't you remember? The little dog?" the wheels clicked and the numbers popped up. I said, "Oh! Of course!"

Maurice Nayberg took us home with him and we stayed all afternoon, being treated in the fashion expressed by the Latin saying: "This house is yours." The hospitality of the Naybergs was the more appreciated in that it was utterly unexpected; they were under no slightest obligation to be kind to us.

We had been treated with similar openhanded friendliness by the Quirogas in Chile, again under circumstances "over and above the call of duty." Was this warmth characteristic of South America as a whole? I don't know; one certainly should not attempt to fair a curve on the evidence of two data. To do so is not scientific evaluating but mere wishful thinking. Yet a thousand other lesser data all pointed in the same direction. My horseback opinion, admittedly gathered too quickly, is and remains that the vast majority of South Americans have their hands extended in welcome to all gringos who have the gumption to see it.

A more soul-searching matter is the question as to whether our own beloved country is equally openhanded? It is difficult to give a fair opinion; I am inside it, a part of it, and it is hard for a fish to see water. Would strangers and foreigners without any sort of contact or introduction be equally likely *to* encounter such treatment in New York? Or in Colorado Springs?

I have pondered this and tried to be fair, turning over in my mind cases in point. We as a people are lavishly hospitable to those who come with any faint sort of introduction, granted—but do we make welcome the stranger who has none of any sort?

Yes, I think we do, provided the stranger and foreigner himself is open to it—a proviso which applies just as firmly to South America. Possibly we are a shade more shy about it but not much, not enough to matter. Certainly we are more provincial, less cosmopolitan, than they are, for the same reasons that New Yorkers are so much more provincial than are people in the rest of our country.

But the willingness and friendliness is present everywhere among us. Any foreigner who finds America "cold" had better look for the coldness in his own heart.

Is this ready hospitality, then, a characteristic of all peoples everywhere? Need the frightened boy only go through the gates of the Great City to find inside the same "kind hearts and gentle people" that he left behind him in his own village? I was ready once to assert that it was so, but I was wrong. While the trait may be potential in all humans, it is a cultural trait and some cultures do not have it. Just to nail this down see Ruth Benedict's frightening description of Dobu culture in her *Patterns of Culture.* If a Dobu offered a drink to a stranger it would be only for the purpose of poisoning him. Yet the Dobus are genetically precisely the same sort of humans as are those of certain other warm and friendly cultures around them.

But I did not change my mind through reading scientific anthropology; I had it changed for me, through visiting a country later where we were not treated with ordinary civility, much less openhanded hospitality. The experience cured me of the romantic nonsense that people everywhere are just like the folks back home. Some are not.

The delightful visit with the Naybergs ended our stay in Uruguay as the ship sailed later that day. We left bearing presents and numerous cards of introduction to persons in half a dozen other countries, for Maurice himself was in the Uruguayan diplomatic service and his father was in the import-export business; the family was well acquainted abroad. Maurice walked us down to our ship.

Perhaps, having penetrated a Uruguayan home, I should describe it; actually there is no need to do so. It was a large city flat of an upper class family and would have looked equally at home in any large city in the world. I will mention Clarita instead. She was a little pigeon hen who had had the misfortune to break her wing; Mrs. Robert Nayberg found her and nursed her back to health, then set her free. But Clarita declined to leave. Oh, she joined the other pigeons that flutter around the many monuments of the city but she roosted on the Nayberg balcony at night and spent a good deal of each day inside the Nayberg flat, visiting and making occasional messes on the floor; it was her home by her own choice.

Which showed amazing good sense for a bird brain and showed still more about the sort of people the Naybergs are. No description should be entirely flattering; there should be some criticism at the very least, for contrast and to lend conviction to favorable statements. But it is very hard to find anything to criticize in Uruguay.

This will have to suffice: sometimes it is not possible to find a taxi down where the ships dock, in which case the visitor must walk almost half a mile to the nearest tram. Obviously this could be improved. Of course the weather will not be cold for walking and it is unlikely to be unpleasantly hot.

But it *might* be raining.

VI

Wakening Giant

BRAZIL IS LARGER than the United States by more than 300,000 square miles, by an area equal to Texas plus the State of New York. It is the largest country outside the Iron Curtain.

This chapter should be served with a side dish of superlatives, to which you could help yourself when you pleased without risking surfeit. Almost everything about Brazil is biggest, largest, longest, or greatest. In addition, after four hundred years of progress moderate to slow, the joint is jumpin' in all directions. Steel mills, factories, hydroelectric plants, oil refineries, office buildings, superhighways, airports, railways, all are going forward everywhere despite the oppressive tropical heat which prevails in so much of the country most of the time.

Although bigger than we are in area Brazil has only about a third the population we have, around 54,000,000. Nobody knows how many people the country can support. Although discovered in 1500 the country is to a considerable extent still unexplored; some of those 54,000,000 are naked Indians who have never seen a white man. The only thing we can be sure of about Brazil is that we haven't seen anything yet; it is entirely conceivable that the Brazilians may be the New Romans of the next century, just as the British were of the nineteenth century, and as we seem to find ourselves elected in this century (if the Russians do not take from us that uncomfortable honor, of course). Brazil has enormous resources of thorium ore, the world's second largest betatron, and an extremely active nuclear research program; she does not lack any potentiality for greatness and dominance.

Brazil has been successively an unknown territory awarded by the Pope to Portugal, a colony, a kingdom, an empire, and a republic. She has suffered and still suffers from political growing pains but has been fairly stable politically for some years now; it may well be that her future will be relatively free of the internal upsets that interfere with economic and social progress. Brazil was late in getting rid of human slavery (1889) yet this is a country where no color bar can be seen and black and white mix socially without tension—or so it looks to an outsider.

Because M.S. *Ruys* spent only three days at dock in Brazil Ticky and I had only opportunity to nibble at one corner of the Colossus of the South, just enough to sample it for flavor. We liked the flavor and want to go back for a full meal someday, but, as always, we were forced to hurry on if we were to get all the way around the planet. (The man who first said, "It's a small world," certainly must never have tried it; the durn thing is *much* bigger than I had ever believed.)

The ship called first at Santos, major port of the State of Sao Paulo, the booming Texas of Brazil. Brazilian police came aboard and required all passengers to surrender their passports for police cards before permitting them to go ashore. Ticky did not like this at all and I did not like it too well, nor do I see that it was necessary or useful since other countries get along all right without it. Nevertheless it seemed harmless since the passports were not removed from the ship but stayed in the custody of the cop on watch at the gangway. In any case if we were to go ashore compliance was inevitable; we turned in our passports.

Santos is not a tourist town and the docks are not laid out to accommodate tourist ships. There was an endless, uncomfortable, and somewhat hazardous walk along the piers, dodging cranes and trucks and railroad cars and rope slings loaded with cargo before we reached one of the guarded exits, where again our permission to go ashore had to be checked. This merely put us on the right side of the fence; there were no taxis nor any prospect of same, nor any public transportation near by. This is not a complaint, because so far as I know Santos does not advertise for visitors. In Rio, a city which does so advertise, ships tie up at the foot of their "Fifth Avenue," Avenida Rio Branco. Fair enough, both ways.

But the inconvenience does not add to the charm of Santos. After several blocks we came at last to a street with tram rails and presently were able to hop a street car. The trolleys in Santos are Toonerville affairs, dinky, open to the weather at the sides, old, and very crowded. They are a treat to ride, unless you are the sort of person who can't bear to share a taxi and would not think of using the subway; they put me in mind of the San Francisco cable cars and have much the same out-of-date charm. We lurched through narrow streets and swung wildly around corners while the conductor climbed over feet and reached over heads for fares. People swung aboard from either side and jumped off and clung to the sides and ends, all without caring whether the car was moving or stopped. I gathered the impression that the car came to a full stop only for cripples, babies, and sissy *norteamericanos.*

I do not see how the conductor managed to collect all the fares; it would be easier to fold a newspaper in a high wind. Perhaps an honor system helped him—the South Americans we met seemed painfully honest in small matters. Or perhaps he was satisfied to collect a good percentage of the fares.

All the transportation systems we encountered in Brazil were extremely crowded. This is not a criticism; I simply note a fact that is historically an unavoidable growing pain of boom times anywhere. We have not licked this problem and I do not think it can be licked. A booming, prosperous area is always one where people pour in faster than services can be built to accommodate them, which means crowds, choked subways and highways, long waits in restaurants, poor service, high prices—and an overall feeling of excitement, hope, and nervous tension.

The quiet, leisurely places of cheap servants, low prices, and *dolce far niente* are stagnant and poor; this is a law of nature and it calls for the lobster-shelled conscience of a Bourbon not to be affected by the poverty underneath.

Brazil is both of these things at once. The older pattern of extreme wealth and peasant poverty with no middle class still exists side by side with boom times, peasants streaming into the cities to find industrial jobs, and a growing middle class. The *barrios bajos* of Rio may not be the world's worst slums but they surely win dishonorable mention. They are almost vertical shanty towns, built of trash on hillsides too steep to be useful for commercial buildings; they have not even water, not even a neighborhood faucet, and of course no other services. Here many of the penniless poor from the country wind up, a reservoir of labor, and of disease, vice, and crime . . . and riot and rebellion. The government and the better-off Brazilians are striving to cure these sores, but the problem is mammoth.

But we were still back in Santos. Santos is an old city and looks it; it is necessary to get far into the outskirts to find the twentieth century. The plazas, the venerable trees in them, and the age-encrusted buildings around them look like a set for a South-of-the-Border musical comedy. The traffic and crowds of the industrial boom swarm through the old streets, a noisy affront to their sleepy, eighteenth century charm.

We took a bus from Santos to Sao Paulo, a bus which was as out of place in the plaza of Santos as a spaceship in a corn field, it being at least three per cent more shiny, modern, and gadgeted than the best of Greyhound and Trailways in the States. Once outside the city streets we entered a superhighway toll road straight out of *Fortune* magazine. It is of the same sort and quality as the Pennsylvania Turnpike, but here the engineers had no railway tunnels already built to help them through the tough places, of which there are plenty.

The road ran first through miles of banana plantation; the bus ate up this stretch at about ninety, vibrationless on perfect pavement. Then the road reared up and jumped at the Serra do Mar mountains; the bus eased back to seventy and zoomed up and over them, a three-thousand-foot climb in a few minutes, piercing mountains, leaping chasms. There were no hairpin turns, no bad grades, no stretches to make the timid nervous; only on looking back was one aware of the concrete spiderwebs on which we had crossed the gorges.

But one did look back. The spanking climb right up the face of the mountains produced swiftly changing, garishly dramatic vistas, unreal and improbable. The hot, water-soaked air was not perfectly transparent; we could see the ocean but not the horizon. Instead the tropical haze produced endless stereo depth on depth, a misty Land of Oz in colors too bright and miniature modeling too perfect to be convincing.

The bus plunged on into the mountains, the skyline pulled in and things came back to their proper sizes. There were signs of intense industrial activity all along the hundred or so kilometres from Santos to Sao Paulo, tire factories, artificial lakes for water and power, high-tension transmission line towers marching over hill and horizon. The great double road was gardened throughout its length but beyond the dedicated expanse there were many big signboards of the sort that disfigure our own roads but are not very common elsewhere in South America. I could not read them but pictures are pictures and trade names persist; I amused myself by trying to pick out the influence of the Yankee Dollar. The majority of the foreign firms appeared to be ours, with England pushing us hard in second place, and Germany a fairly strong third. The incorporations were Brazilian but the trademarks and names usually made the parent foreign corporation obvious. "Esso" was everywhere, along with "Delco" and "International Harvester" monograms and General Motors and many other heavy-industry firms from the north.

And Coca-Cola, of course—we rich barbarians have been accused of having added nothing to world culture. This is a most unfair canard; we have contributed Coca-Cola, jukeboxes, and comic books, all worldwide in scope.

I am only half joking. When the water is not safe to drink, as so often is the case abroad, and your stomach rebels at the idea of more strong coffee, strong tea, or alcohol, Coca-Cola really does offer a pause that refreshes—and you can buy it almost everywhere. As for jukeboxes, the quality of the music is up to the man who inserts the coin; the machine itself is a worthwhile accomplishment. Comic books I won't defend.

I myself am very weary of being told by scornful Europeans that we have no culture. In the first place it simply is not true, even in the snooty sense in which the sneer is usually put, as in painting, music, and literature we are lustily productive. But in the widest sense we have made the greatest cultural contribution of any society to date, by demonstrating that 160,000,000 people can live together in peace *and* freedom. Nothing else in all history even approaches this cultural accomplishment, and sneers at *our* "culture" are both laughable and outrageously presumptuous when emanating from a continent that habitually wallows in its own blood. I'll take Coca-Cola, thank you; it may be vulgar, no doubt it is simply impossibly American, it may lack the bouquet of a Continental wine—but it is not flavored with ancient fratricidal insanities.

During the trip to Sao Paulo I sat next to a local citizen. We chatted throughout the ride, he in Portuguese and I in English. I found Portuguese even harder to chew than Spanish, but we got along all right as his acting was more than competent. When we pulled into the outskirts of Sao Paulo he pointed out places associated with the emperors of Brazil and, at last, helped us off the bus and directed us to the hotel where we had been advised to have lunch. My Spanish had been no trouble to him at all; he simply thought I was speaking English the whole time.

(Only three words are necessary to travel all over South America: *"gracias"* and *"por favor."* They cover all situations.)

The parks and plazas and monuments to Emperor Dom Pedro II in Sao Paulo are old; practically everything else is brand new. This is the

Dallas of the boom country. It has almost as many people as has Rio de Janeiro—as of 1953, that is; by today it may have more than Rio. It is bursting its britches and new construction is going on all the time and everywhere, even during Christmas holidays. It is not safe to lean against a building there; workmen may come along and yank it down, letting you fall into the excavation. But there will be a new building in its place almost at once.

We enjoyed a gourmet's lunch on the top floor of a skyscraper hotel. View windows looked out in all directions and I looked out through them. It did not look like Latin America; it looked like Chicago. Sao Paulo being on a plateau of almost 3000 feet elevation its climate is not as oppressively hot as is Santos; the people are exceedingly energetic. So far as we noticed there was no slow down during the traditional siesta time; they seem to have given up the afternoon nap, which seems deplorable. Progress can be overdone.

The traffic was fast and hazardous. All Latin Americans drive with courage but Brazilian drivers seem to have even more careless abandon than the others. But their conventions are much like those elsewhere in the continent and we were now somewhat used to them; there were no casualties—which was just as well; in Brazil, if a driver runs you down, he usually sues *you;* the pedestrian is not assumed to have the right of way.

We shopped along a street of smart women's shops having the unlikely name of Rua Bardo de Itapetininga. I complained that I had seen the inside of every retail shop for ten thousand miles and that we might as well have settled for Denver, but it did me no good. Ticky answered that she had been dragged into every bookstore over the same route and, besides, everybody knew that the quickest way to size up how a country was getting along was to take a look at what was offered for sale there—quantity, quality, variety, and prices.

I muttered that looking was all right but if she kept up her pace she was going to ruin the economic structure of each country we visited, but she did not hear me; she was already plunging into a blouse shop, her nose quivering like a bird dog catching a scent. The shops certainly did have pretty things and the handmade blouses were among the prettiest. Ticky insisted they were "bargains" and I suppose they were. I never will understand about such things; to my mind a bargain is something I need at a price I can afford.

Somehow the *senhoras* were less intimidating than the grim, firm-bosomed females that jostle one in our own department stores. Where do those women go when the stores close?

You rarely see them (thank heaven!) anywhere else. My own intense dislike of shopping is based on a fear of being trapped on an upper floor by a mob of them; I think I suffer from a subconscious conviction that they are carnivorous.

But the *senhoras* and *senhoritas* are soft-voiced and gentle even at a stocking counter.

We had to buy some shoes. That was understandable; South American shoes do even more for the female foot than does a hot water bottle. The designs are indecently sexy. Ticky found, and bought, a pair of black high-heeled slippers the tops of which were nothing but nylon diamond-mesh. They turned bare feet into naked feet, an effect similar to that achieved by dressing a woman in opera-length black hose and a Gstring.

I pointed out that if she wore them she might be arrested; she could not be nakeder if she wore nothing but the shoes because no one would look at anything but her feet—and gasp. "That is exactly the effect I want," she said smugly, "a simple, modest dress and my feet looking out in those and leering. I'll take them." She did not even ask how much they cost.

Satiated at last with shopping, we loafed for a while in a dreamy, old garden filled with fountains and birds, which is surrounded by the swarming Sao Paulo retail district and is near the bus station. There was time still to hire a car and a guide, but the garden was so pleasant that we decided to take for granted that Sao Paulo had public buildings, a race track, and points of historical interest. We knew that it had; the pamphlet we had with us told us so, but we gave them the rest of the day off and stuck with the birds and the fountains.

At last we walked slowly and reluctantly back to the bus station. The interurban station there is an extremely busy place with a bus pulling out every few seconds and a dozen loading at once; it had a population density as thick as you can get without stacking people in two layers. All seats are reserved and tickets must be bought ahead of time.

The bus for Santos has some other name, I never did find out what. I was trying unsuccessfully to buy tickets and succeeding only in holding up a queue of others equally anxious when a man came to my rescue. He had the face of a jovial hawk and about twenty words of English, which was eighteen more than had of Portuguese. With his help I got the tickets, then he firmly kept us from getting on the wrong bus.

He stayed with us then, to keep us straight, and flipped his lapel to show some sort of shield; I understood from the gesture that he was a plainclothesman. But he was not satisfied that we understood his status. He pulled down his lower eyelid to show that he was an "eye," then pantomimed in detail the operations of a pickpocket, plus other gestures adding up to a charade that he was assigned there to protect the crowd from pickpockets.

It was clear to us and I suppose it was equally clear to any pickpocket present. But he was a most successful goodwill ambassador for his country. He kept us from getting on several more buses, put us on one at last and spoke to the driver about us, then waved us out of sight.

The run by sea from Santos to Rio de Janeiro is only overnight. The *Ruys* stood into Rio Harbor before breakfast; Ticky and I got up early and watched it from the bridge by invitation of the Captain. The regulations of every ship state that passengers are not permitted on the bridge; I have yet to be in a ship in which the master felt it necessary to enforce the rule. This was the first time Captain Verwijs had invited us and it was a treasured privilege, for Rio has the most glorious harbor in the world.

Oh, I'll admit that it is not a scientific statement; I have not seen all the harbors in the world. But in the course of some years at sea as a youngster, plus other trips since, I have seen a lot of them and I have compared notes with others who have seen the important ones I have missed. I am not counting uninhabited fjords in Norway nor anything like that; I speak of seaports. I stick by the statement and strongly doubt if anyone can be found who has seen Rio who will vote for any other harbor.

Sydney Harbor has its backers for the honor, but, while Sydney's harbor is beautiful, it is not in the same league. The approach to Seattle through Puget Sound is lovely but the Seattle roadstead is not much to see. Golden Gate has one fine view; Rio has a hundred. As for New York Harbor, the approach up Bedloe Channel is essentially ugly, despite the famous skyline and the beloved Statue of Liberty.

Rio, lovely Rio, is the one harbor without fault or blemish, a sight for travelers which cannot disappoint, a case where the glorious reality exceeds the buildup.

Provided the weather is good, of course, since the inside of one rain storm looks much like the inside of any other. We were lucky indeed to draw a golden day. I hope you are equally lucky but don't expect it; Rio has heavy rainfall right through the year.

I do not understand the geology of Rio. The bay looks like a flooded river valley among mountains, but no major stream runs into it; the principal drainage of the back country parallels the coast line behind a row of mountains and discharges a couple of hundred miles away. The land must be slowly sinking into the sea here to produce this wonderfully complicated shore line, but what accounts for the curious conoidal mountains? Are they the cores of volcanoes laid bare by eons of erosion? If I could tuck in a souvenir picture folder at this point I would not attempt the silly task of describing Rio. On second thought I won't attempt it anyhow but will risk only brief comments.

Can half a ton of blueprints and a dozen thick books of specifications convey the breathtaking beauty of a jet bomber in flight?

There are hills, mountains, inlets, points, bays, and beaches in such profusion that it cannot all be seen from any one point, even from the top of Corcovado. There is a great city spilled like gems into this three-dimensional primitive beauty. There is lush tropical jungle, rain forest, covering all but the city itself, the bay, and the hunching summits of rock.

The much-pictured Sugarloaf is only one of a dozen sugarloaf mountains here. The compass-scribed sweep of world-famous Copacabana has a dozen rivals, each unfairly overshadowed in fame by the misfortune of being too close to the one with the famous name.

I had known as everyone knows that Copacabana was backed solidly by tall buildings in a dazzling modern style designed for enjoyment of tropical climate, but I had not known that this free and generous architecture framed all the beaches and spread throughout the city. Rio looks as if it were fifty years into the future. By comparison all of our own cities look as antiquated as a rolltop desk.

The *Ruys* spent only one day in Rio, which left no time for leisurely poking around; we were forced to hire a car and a guide if we were to see as much as possible. We were not too lucky in the guide; he spoke French, Spanish, and Portuguese but only a half dozen words of English. He could point things out to us and tell us what they were but we missed the sophisticated and idiomatic discussions with which Herman enlivened Buenos Aires.

Our first impression was of overpowering, suffocating heat. If the car stopped for only a moment to let traffic change, we found ourselves panting, almost ready to pass out. We were there in their summer (late December). The records show that July averages eight degrees cooler with less than half as much rain, so July is the time of year that we plan to go back and do Rio properly. That means that we will never see Carnival in Rio, since Mardi Gras must fall either in February or the first week in March, which are even hotter than late December.

I hate to give up forever the prospect of Carnival in Rio, but I can't be gay in a steam bath. They say that Mardi Gras in Montevideo is just as much fun and the weather is ten degrees cooler. Or perhaps the trick is to roister in the streets all night and sleep all day in an aircooled hotel room. Hmm—

Presently our guide got us out of downtown and we began to perk up. Rio is even better equipped with parks and gardens than is Buenos Aires, and tropical rain forest growing conditions make it inadvisable to poke a walking cane into the dirt—it might sprout. After a long and confusing tour of parks and plazas and public buildings we started out along the beaches, where it was so cool that it was just pleasantly warm. The beaches of Rio are so long and so wide (most of them) and so numerous that they aren't very crowded, not so much so as Laguna Beach and nothing like the solid mass of pop bottles, chewing gum, and sweaty bodies that hides the sand at Coney Island. But Australians would find the surf a little on the nice-old-lady side since the enclosed bay keeps the rollers from having room to work up much muscle.

But the sand and sea are just a sidewalk away from the hotels. The wiggly-patterned sidewalks, so conspicuous in postcards, are not limited to the Copacabana; the other beaches have them, too, and so does downtown Rio. We saw them in Santos as well. This pleasant, useless custom gives dull stretches of concrete a holiday air; I would like to meet the lighthearted gent who started it.

I noticed just one Bikini suit and only a few bare-midriff models. South Americans are a bit conservative about displaying female hide.

After the beaches we started up the Corcovado. This mountain is twice as high as Sugarloaf and is the site of the Cristo Redentor statue. We had time for one viewpoint or the other, but not both. I wanted to ride the famous cableway to the top of Sugarloaf, but Ticky gets a bit dizzy on step ladders and grew downright mutinous at the prospect of being locked in a cage and then being swung spiderlike high in the air on a string.

So we compromised her way and I did not regret the choice. The drive is spectacular and exciting. The road is very narrow, barely two cars wide, filled with hairpins and blind corners, and engineered like logging track. It leads through lovely suburban home districts, parks, and virgin tropical forest, past waterfalls and canyons that got me to thinking of Coleridge and *Kubla Khan.* I thought about them still more when we stopped at a restaurant half way up and discovered that the restaurant grounds included a labyrinth grotto that wandered almost endlessly around the mountain—an enchanted place of silence and cool moss and dim, religious light.

The climb was very steep and our ears began to pop. Ticky dug out chewing gum and gave me a piece to relieve the discomfort. We had with us the English lady with whom we had first teamed in Montevideo. She was unattached, a widow, and was good company once she was convinced that we did not sleep in our boots; we had formed the habit of inviting her to go ashore with us. Ticky now offered her a stick of gum.

She accepted it gingerly. "What do I do with it?"

"Just chew it. It will help your ears to adjust to the altitude," Ticky assured her.

"What happens if I swallow it?"

We assured her that every American child had swallowed a piece or two without any ill effects. "Chewing gum is a custom we learned from the South and Central American Indians. It's quite harmless."

I think she tried it rather than risk offending us—she was in all respects a lady. But I am not sure she liked it.

Cars cannot go quite to the top of Corcovado; there are a hundred-odd steps up to the foot of the Christ statue. We climbed them very slowly, as the heat and humidity were bad even on the mountaintop. But the view was worth a much harder climb; we had the great bay spread around us, the great city in our laps. But I balk at describing it. I can think of three city vistas in North America which deserve to be classed with it: San Francisco Bay from the Top o' the Mark, New York from the 86th floor of the Empire State Building, and Los Angeles County from Mount Wilson. The view of New York is equal in interest; none of the three is equal in beauty.

With that I will leave it. Go see it for yourself. Put it at the head of your "someday" list.

The Christ statue is impressive and huge, but as statuary it is a stylized scarecrow, not in the same class with the Christ of the Andes, which is worthy of Michelangelo. It is so posed and simplified as to appear as a cross from the city, rather than as a human shape; to that end it is very effective.

The trip down was even wilder than the trip up. Despite the long drive there was still an hour or so before we were required to be back aboard ship so we had the driver drop us on Avenida Rio Branco, the main shopping street, at the foot of which the *Ruys* was tied. Downtown Rio is not too much to my taste. Basically it is no worse than other big cities and in some respects is better, in neatness and general appearance. Rio Branco, for example, although a skyscraper canyon of a street, is edged with trees right downtown. But city crowds are bad enough at any time; in oppressive heat I find it easy to hate all humanity.

For once Ticky felt too dragged down to shop; her bounce had melted down in the heat. We looked in a few shop windows and I noticed that Rio named streets the way other South American cities did—the 1st of March intersected the 7th of September at a corner of 15th of November Square, also there was a President Woodrow Wilson Avenue, a Buenos Aires Street, and a Uruguay Street all in that one neighborhood. We saw citizens patiently lining up in queues two and three blocks long for the privilege of a seat to get out of the city at the end of a difficult day. Rio is wonderful but they should throw a dome over the whole city and aircondition it in toto—this should not be too hard for people with the energy to build this wonderland in spite of the climate.

We found the flower market, big as a general farmer's market in most cities, and saw orchids too numerous to guess the number. But we did not find a green orchid which was what we wanted. After that we looked in on one of the many fine jewelers, "H. Stern" it was. Rio is the place for amethysts, aquamarines, and topazes; they are magnificent and so cheap that samples are given away to visitors. I risked letting Ticky go in because she does not really care for most jewelry. She has simple tastes and even diamonds leave her cold; all she wants is emeralds, nice big squarecut ones—and Colombia is the place for emeralds, not Brazil.

The ship was an easy walk down the street, provided we took it slowly and avoided sunstroke. But the weather shifted gears and we made it to the ship just in time to be soaked to the skin in the last two hundred yards.

VII

The Farthest Place

THERE WAS A feeling of excitement in the *Ruys* after we left Rio, caused by the possibility that we might receive radio orders to turn aside and make an unscheduled call, a stop at the most remote port in the world.

The world is conceded to be a small place these days, with airlines straddling the oceans, with boats and trains and buses linking No Plumbing, Kentucky, to No Hope, New Zealand. No place is more than a week away from the nearest airline ticket office, plus a possible day by bus or train, or at the most three days for some South Pacific islands.

Is there any really remote place left? Behind the Iron Curtain? A political barrier, not a physical one. The North Pole? The North Pole needs traffic lights these days to keep the Russian patrol planes from bumping into our own. Antarctica? Yes, but Admiral Byrd's continent is uninhabited; I had in mind places where people live. There are a number of places very hard to reach which are unfit for human habitation; that is why there is no transportation to them. What is the most remote *settlement* in the world?

There is an Indian village in the Grand Canyon that is almost never visited by outsiders. But you can make it in two days from New York, by airline, by hired car, and by hired mule. There are pygmy villages deep in the Congo, but safari companies will outfit you and provide professional guides. One way or another almost any inhabited spot can be reached by recognized commercial means. But there is one place left on earth which has long been settled and has a recognized, established government which cannot be reached by any regular means whatever, but only through lucky chance.

It is Tristan da Cunha, a British colony in the South Atlantic, almost precisely midway between Antarctica, South America, and Africa. It is 1500 miles from the nearest land, St. Helena, a spot itself so remote that it was picked as a safe prison for Napoleon Bonaparte after he crushed out of Elba.

There is *no* way to buy a ticket to Tristan. No South Sea island is so hard to reach, so hard to leave, so far from other inhabited land. It is the most remote settled spot on this planet. The *Ruys* was being considered for a special stop there because the government meteorologist and radio operator stationed there had been waiting seven months since the end of his three-year tour of duty for opportunity to get himself, his wife, and baby back to the mainland—any mainland.

It meant adding nine hundred miles and about three days to the voyage from Rio to Cape Town, but there was opportunity to pick up fifty tons of frozen lobster tails there for Cape Town; most of the great cost of detouring a big ship could be charged against pay cargo. But the real question was whether the stop could be made at all. Tristan has no harbor of any sort. Sheer cliffs face the sea on all sides; at their feet are narrow beaches. A ship must anchor off shore and send in small boats. But dense fogs, fierce winds, and mountainous seas are common diet there and whole gales, with winds of seventy-five miles an hour or more, blow up without warning from the subarctic regions below it.

For several days after we left Rio the common subject in the ship was the latest radio weather report from Tristan da Cunha. Would the Captain risk it? Or would we turn aside and go on to Cape Town? No company agent could order him to attempt it; he must decide for himself whether the bet was worth taking—not so much risk to the ship, for a ship as big as the *Ruys* would not be risked for all the lobster tails in the South Atlantic, nor to help a family (safe where they were) to get home. The risk was something on the order of $10,000 in ship's operating costs, a fairly big gamble to take on very treacherous weather against the chance of a modest profit.

We discovered presently from radio reports that the islanders were even more excited at the prospect than we were. No ship the size of the *Ruys* had ever called there in all the history of the island. Any ship at all was a great event, but this was the greatest thing in the memory of the oldest inhabitant. The colony was preparing to welcome us in every way that they could.

About two days before we were to arrive Captain Verwijs decided to take the bet—subject to the possibility of pulling out at the last minute and accepting his losses if the weather turned sour.

We all got up early on landfall morning. The Captain must have been living right and saying his prayers; the sky was clear and brilliant, the ocean was blue and calm, Chamber of Commerce weather. Tristan was a great, flat cone in the distance, a textbook volcano. The two other volcanic rocks in the group, Nightingale and Inaccessible, both uninhabited, were on the horizon. We anchored a mile off shore opposite the one settlement—Edinburgh, known simply as "The Settlement"—in water so calm that the ship did not roll at the hook and so clear that we could see schools of fish twenty, thirty, fifty feet down.

The Chinese crew, all who were not on duty, promptly dropped lines out of every porthole on the lower decks. The Chinese ran their own mess and were paid their rations by the company in cash; they fished at every opportunity. But this was something extraordinary; a hook hardly had time to get wet. Shortly passengers joined in the sport—if it can be called sport to get a large bucketful of fish in a few minutes.

The entire able-bodied adult male population of Tristan swarmed aboard. There are only two hundred and seventy-six men, women, and children in the colony; about eighty of these are men old enough and young enough to handle pulling boats in the surf. The oldsters, the youngsters, and the women had to be content with a view of the wonder ship from afar.

They had a rummage-sale appearance in their dress; storeboughten clothes are scarce and precious on the island. Most of them wore home-knitted long heavy white woolen stockings and homemade leather moccasins. A few had shoes for such special occasions. Save for their footgear they looked like anyone else.

But their manner was different. The difference is hard to describe without sounding snottily supercilious since "childlike" is the word that comes most easily to mind. But they are not childlike, not morons, not savages, but they are people who have been out of touch with the rest of the human race, save for rare visits from passing ships, for generations.

Their isolation would have been only a little more nearly perfect had their ancestors moved to Mars. Whatever the nineteenth and twentieth centuries have done to us has not been done to them. Wars, psychoanalysis, mass production, traffic, atomics, Marxism, airplanes, female emancipation, Hollywood, Kaiserism, suffragettes, paved roads and automobiles, market crash and depression, Sex Appeal and "It" girls, ENIAC, these things *never happened.*

We are closer to Benjamin Franklin than we are to these people. Although the good doctor was born two and a half centuries ago and knew none of the things listed above, he was up to his ears at all times in the same continuing struggle we are now in, whereas these islanders seceded from it. They have come very close to resigning from the human race, both culturally and biologically; they have been a separate breed and a separate culture for more than a century.

It was very hard for us to talk with them. We shared the same language, English, and their accent and idiom was not as difficult for American ears as, for example, Yorkshire; what we lacked was common experience. A detective in Sao Paulo could tell us, without language, that he was watching for pickpockets; we both knew what pickpockets were. We shared with the detective a common culture, Western and urban; lack of language was a mere nuisance to be circumvented.

But with these islanders, although our language included theirs (their vocabulary is, for obvious reasons, quite limited), there was very little that could be said with it. We could ask direct questions about simple things—boats, sheep, weather, potatoes, fish. They would answer, readily enough, in simple declaratives—and there the conversation would bog down. Discussion was out of the question.

Chief Repetto, the headman of the island, had arranged for boats to take us ashore. The Captain had not granted permission for this and, while we awaited his pleasure, the breakfast call was sounded. As the islanders had not eaten either, some of the passengers took them in to breakfast as guests; Ticky and I took the headman to our table.

It was a painful meal, at least for us. We tried to bridge the strangeness with social chitchat, but it was impossible. When I found myself asking for the third time how many people there were on the island, I gave up. But I do not think that Chief Repetto was shy and I think he enjoyed himself—I hope he did. The islanders seldom have meat to eat; the breakfast menu of the *Ruys* was rather lavish, including ham, bacon, several sorts of sausage, and a variety of cold cuts. The Chief started at the top of the page and ate stolidly down to the bottom, neglecting nothing.

To the disappointment of all of us word came from the Captain after breakfast refusing permission for passengers to go ashore. I felt a sharp pain in the pocketbook: the loneliest island looked like a sure-thing slick-magazine article provided I could get ashore and take a few pictures. But the Captain expressed his regrets and explained that his decision was forced by the necessity of being ready to up-anchor and run, with no delay, in case of a shift in the weather . . . to which we had no logical counter argument.

So we spent the time trying to talk with the islanders and bought stamps from them (it was the first day of their first issue) and watched the loading of cases of lobster tails and gazed at the village through binoculars and fished. The lobsters were loaded from a little steamer whose masthead barely came up to the level of our forward welldeck. This vessel itself was used to ferry the catch to Cape Town when no larger ship was available, but it was easy to see why the meteorologist and his family had waited; she was larger than a soup tureen but not much—utterly unsuited for a woman and baby. I misdoubt the lobsters got seasick.

Eight-power glasses brought the village up to within a city block. The houses looked all much alike, one-story buildings of big, shaped lava blocks with thatched roofs. The thatch is New Zealand flax, which grows on the island. The dwellings were local-material equivalents of sod houses or of log cabins, one step ahead of a cave. But I did see the glint of glass in some windows.

The Administrator from the British Colonial Office, the Honorable Mr. J. P. L. Scott, was aboard; when he was through with his official duties I cornered him and quizzed him. He is the government, "The Law West of Pecos," "—the cook and the captain, bold, and the mate of the *Nancy* brig, and a bosuntight and a midshipmite and the crew of the captain's gig." He is the postmaster, the chairman of the council, the recorder, the tax collector, the port captain, the magistrate, and anything else which requires the attention of Her Majesty. His job as magistrate is not onerous; there is no crime.

The islands were discovered in 1506 by Tristdo da Cunha. For three centuries they were visited only occasionally, but in 1811 one Joseph Lambert, an American citizen, claimed them as his personal empire (and sealing station); he published his claim and designed a flag. Offhand his claims seem as valid as any other in history and less presumptuous than most. This lefthanded American occupation came to an end in 1816, when the British established a garrison there to keep the islands from being used as a base from which to rescue Napoleon. Only one of Lambert's colony was left at the time; Lambert himself had drowned in a sealing accident.

The British pulled out the garrison the next year, but Corporal William Glass got permission for himself, his wife and two children, and two sailors to stay on; this started the present colony. Over the years a few others joined them, including some women from St. Helena, but the colony grew mainly by natural increase; even today there are only seven family names on Tristan. Mrs. Glass did her part by having fourteen more children, a fact less surprising in view of the very limited recreational facilities.

The soil is poor and, while rainfall is adequate, the bad weather and high winds are no help; potatoes have always been the only crop they could rely on. Even that sometimes failed, or was devastated by rats or caterpillars; many times they have been close to starvation. The

British government regarded the islands as unfit for occupancy and more than once tried to get them to accept relocation. But they won't go; they like it there despite the material hardships. Perhaps in view of the mess the rest of us are in and the prospects facing us their attitude is not really cracked.

Fish, potatoes, and birds' eggs collected on Nightingale are their only important foods; sheep and oxen are considered too valuable to slaughter. Of recent years attempts have been made to grow fruit trees but nothing much has come of it as yet. The biggest change has come since the War, through the establishment of the lobster-packing plant. The "lobsters" are our west coast lobster, or spiny crayfish; not the true lobster of Maine. You are probably now buying their lobsters, packed as "Union of South Africa" for the company is a Cape Town company. This company employs all of the men part time and for the first time in its history cash money is coming into Tristan, making it possible for them to buy things made in the outside world. Possibly this is the thin wedge that will eventually place Tristan on the map, join it by regular service to the outside world. Possibly—though it has not as yet; lobsters can be sure of a berth; a traveler cannot.

The Cape Town company has hired an agronomist and a doctor for the islanders. The agronomist has a real job cut out for him to find ways to grow something other than potatoes, but doctor would appear to have a sinecure. There is almost no disease, except colds picked up from passing ships, and it is customary to die of old age in the eighties or nineties. They don't need a dentist—perhaps there is fluorine in the water; I could not find out.

Although the company has been bringing some cash wages into the island for the past four years they are still painfully short on clothes and beg for castoffs from passing ships. The Administrator is trying to break them of this habit; nevertheless many of us in the *Ruys* contributed. I had some shirts I did not like anyway and Ticky somewhat tearfully parted with her honeymoon suit—years out of style and useless on this trip, but which she had kept and fetched along for sentimental reasons (and partly to prove that she was still as slender as ever; Ticky is a fine piece of aerodynamic design). She dug out some shoes for them, too, having just stocked up in South America. I could not spare any, nor would mine fit anyone else; my feet aren't mates.

We stood out of there late in the afternoon and set course for Cape Town. Some of the Chinese had purchased two baby penguins from the islanders; in the course of the voyage it was needful to teach them how to walk. A baby penguin is not hatched knowing how, any more than a human baby knows how instinctively. The process is much alike for both types of babies—hold out your arms and say, "Come to

Papa!"

Whereupon the baby penguin tries his earnest baby best to oblige, flapping his tiny stub wings and hopping manfully in a two-footed hop like a choir boy in a sack race. I laughed until I had pleurisy—and wanted to cry, too; the infant was so willing about it and so serious.

Penguins are very nice people and they don't mean to be funny. A baby penguin is funnier than an adult by inverse square ratio. They feel nice, too; their hairlike feathers feel like soft, warm fur. At that age they are not yet oily and have not acquired the full fishy fragrance that makes the adults something to stay upwind from.

Albatrosses, about six of them, joined us at Tristan and followed us for two thousand miles. So far as I could see not one of them ever flapped a wing the whole distance. They sail without effort, at twenty or thirty knots, rising much higher than the masthead, dipping down to the water for a fish or some tasty garbage, rising again to any height, all without apparent exertion of any sort—just willpower, personality, and clean living. The albatross is deceptively large. I mistook the first one I saw for a gull, having nothing to judge it by—I suppose the best way to see how big one is would be to hang it around the neck of an ancient mariner. They have been measured up to twelve feet in wingspread, more span than the condor, largest of the flying birds. A little crosseyed triangulation enabled me to estimate that those following us ranged eight to ten feet in spread, once I got it through my head that they were big and then waited for a chance to see one between me and part of the rigging. On another occasion one made a crash landing in the swimming pool of the *Ruys* and could not get out. He crowded the pool all by himself and almost beat the boatswain to a pulp before he could be evicted.

Ticky worried greatly over how the albatrosses would get back home, since no ship would be going that way. (We had concluded that their miraculous powers of levitation were based on the thermals raised by the ship itself.) I pointed out that albatrosses had managed all right for thousands of years before men got around to sailing the oceans. But she refused to be reassured: those poor birds were *lost,* and somebody ought to do something about it.

The meteorologist's baby daughter enjoyed the trip back; she was a cute little carrottop and a favorite with everyone. But her mother had a very bad time of it. After nearly four years' unworldly peace and quiet of Tristan she found the *Ruys* (which is really a very quiet place itself) almost unbearably noisy and exciting. The change was too sudden and the poor woman had to spend most of her time in her room.

The rest of us were driving her to distraction.

VIII

The Country With a Problem

Lived a Woman Wonderful... . . . Neither Simple, Kind, nor True
— *South Africa:* Kipling

OF ALL THE countries we were in the Union of South Africa was the most difficult to evaluate.

It is a wonderful country, a glorious country. We liked everything about it—except the race problem. Which is like liking the Pacific Ocean except for the water in it.

South Africa is a paradise where you expect to wake up Nome morning with your throat cut. By comparison, our own racial problems are trivial and ninety per cent solved. Before some colored compatriot of mine, smarting under the wrongs of generations, jumps down my throat, let me add that I *know* that the ten per cent remains to be done, should be done, must be done, but let me point out that the ambition of every literate black man in South Africa is to emigrate to Birmingham, Alabama, or some place else in our Deep South, where he can be among his own kind and still enjoy freedom.

He stands no chance at all of realizing this modest ambition. Carefully contrived laws and rigid customs make it next to impossible for a black man to save enough money to escape. I is gross earnings as a farmhand are about twenty-five cents *a* day; as a contract laborer in industry, in the mines or factories, wages run from twenty-five cents to around sixty cents a day—about what a Pullman porter gets as a single tip.

Apartheid, translated literally as (racial) apartness, is the most pervasive single fact about South Africa. But it is much more than Jim-Crowism, or simple segregation; as legislated by Dr. Malan's Nationalist Party it means that a native must either live in a reservation or indenture himself to a white man; if he shows up in town without a work card he is liable to prosecution.

It means no voice in government, almost no chance for education, no hope for the future. If the native reserves, which are vast in area, were decent land, the system might be defended, but they are not. Only about seven per cent of South Africa is good arable land; the white man has it and the native has been assigned rocky, hilly, dry and almost unusable acreage that the Afrikander does not want. Almost the only way a black farmer can get decent land is by hiring out to a white farmer; then the white man lets him till a little piece of it for himself.

If a native youth refuses to go along with the cheap-labor racket, his position is hopeless; he can never buy oxen, he can never pay for a wife. So he signs up.

It is a legal system to enslave an entire race, without placing on the bosses the personal responsibility for the slaves entailed by chattel slavery. The South African native is neither a free man nor a chattel and he has the privileges of neither.

The Nationalist Party is not a majority party, but it stays in power through an entirely legal rotten-borough system similar to that which obtains in the California State Senate whereby a farmer's vote counts for more than that of a city dweller. In general the Nationalist Party is Afrikander while the Unionist Party is English just as most of the farmers are of Dutch descent and most of the city folks are of English descent. But it is most unlikely that more than a handful of the opposition party could be found which did not favor some form of racial discrimination. Looked at coldly, their reasons for this stand can be understood, for, no matter what might be or what should be, the vast majority of the natives are still illiterate savages. The South African white man who does not believe in Dr. Malan's brand of *apartheid* nevertheless believes that if the native were given his full rights as a human being overnight, the white men would be swallowed up.

There are other approaches, of course. Up in the Belgian Congo a black man can work hard and become an *evolve,* a man with a certificate which makes him a statutory white, entitled to the same wages, entitled to live in white neighborhoods, entitled to place his children in white schools, even entitled to marry a white woman if he can manage it. All of these things are utterly prohibited in South Africa.

I am not arguing in favor of the *evolve* system, as I never saw it in action. I give it as an illustration of the fact that there are middle ways between the extreme of *apartheid* and the other extreme—an extreme which the Nationalist always cites to prove that *apartheid* is necessary and unavoidable . . . when in fact it is neither one; it is an inhuman racket for the exclusive benefit of the white man.

On the other hand, do not be misled by the crocodile tears of Mr. Nehru; the very worst exploiters of the black man are the Hindus. The only real public disorder modern South Africa has known was when the natives turned on the Hindus and tried to chuck them back into the Indian Ocean. If South Africa were opened wide to the hordes of India the black man would not stand a prayer. As it is, world opinion and the more liberal elements among the South African whites may eventually force an improvement in his lot—though it looks hopeless today.

"Americans don't know how to deal with natives"—(or "coolies," "niggers," "Chinese," "boys"). So the British have blandly told us and so also have the other breeds who have held colonial empires. But the fact is that we are the only dominant people on earth who *do* know how to deal with the human beings designated by the above disparaging terms. *Proof:* when we inherited the Filipino from Spain, we promised him forty years of education and help, then full and unconditional freedom; we made good our promise. Whereupon, when we needed him, he fought for us and with us, and is now our staunch ally and friend.

Compare this record with Indonesia, with Burma, with India, with Kenya, with Indo-China, with South Africa itself. The Hollander can hardly get a visa to the country he once proudly called "Holland in the East," the Englishman in Kenya sleeps with his rifle in his bed, South Africa is as yet free of "incidents" on any large scale but every South African knows that the natives are waking and listening and stirring, aware of Mau Mau to the north. It spoils the white man's sleep; it makes him careful to lock every door, every room, every cupboard; it makes him install flood lights around his beautiful Johannesburg home. It makes him very cautious on the streets of his own city at night.

He knows he is sitting on a powder keg, but he does not like to talk about it. He prefers to talk about how you must "handle the natives," how you "mustn't spoil them."

These "pukka sahib" laddies who know so much about "how to treat natives" fail to see the native as an individual. In the *Ruys* the South African passengers thought it was funny, ridiculous, a bit bad for our face really, for Ticky and I to bother to know the names of the Chinese crew members with whom we came in daily contact. Many of them (I inquired) did not even know the names of their own room stewards—said names being posted on little cards outside each stateroom door. As for the barmen or deck boys, they would whistle and shout, "Hey! Charlie!"

This attitude applied even more strongly to the Dutch officers. The Dutch once had the worldwide reputation of being the perfect colonials . . . until the Indonesians chucked them out. An engineering officer in the *Ruys* told me that he did not know the name of a single Chinese among his own engine room watchstanders; he simply knew which one was "Number One" through whom he bossed the others, nor did he know "Number One" by name. I inquired further and found that most of the Dutch officers did not know the names of their own room servants, although in some cases they had been waited on by the same Chinese for several voyages.

We sat successively with three Dutch officers in the course of the trip. As is usual aboard ship the same waiters would serve a table meal after meal, day after day. Yet the Dutch officers who sat with us seemed to find it amusingly odd, somehow undignified, and a rather startling exhibition of memory that Ticky and I always knew the names of the waiters.

They failed to notice that we got better and quicker service than they did, even better than the Captain got.

Of course, we weren't doing anything odd for Americans; I am not pinning a rose on myself. The usual run of American, if he eats twice in the same restaurant and draws the same waitress, will find out her name and call her by it thereafter. He may find out her name the first time, even if he expects never to eat there again, simply because he dislikes shouting, "Hey, you!" If he is served regularly by the same waitress or waiter he is certain to know the name.

This common American habit is not in itself democratic; it is just horse sense. I have emphasized it because, while it is a minor matter to us, simply good manners and convenience, it is a major, important, even crucial difference between us and most other Western white nations. Hell's bells, even a dog is easier to handle if you call him by name! Why can't these lunkheads see that?

The most important possession of any man is his own name. Without a name he has no face. The white man in the East has always emphasized the importance of keeping face himself, but he seems to have given little thought to the deadly danger of not giving face to natives.

In most other ways the South African white (or "European" as he always calls himself) is a remarkably pleasant fellow—jovial, sociable, warm, not at all distant with strangers, being much more like us than they are like the English in this respect. They tend to be somewhat anti-American in general, but not toward individual Americans. This anti-American attitude seems to derive first from a belief that we are stirring up a third world war (they have swallowed the Moscow line on that point), on a dislike for us as business competitors, and a generalized nationalism—South Africans are among the most nationalistic people in the world. They seem to dislike the English even more than they dislike us and speak of the day when they will divorce themselves from England completely—not "if," but "when."

This xenophobia takes the curious form with the Afrikander South African of tending to be a little surly with those who speak English instead of Afrikaans. The country is officially bilingual but a civil servant will be a lot more civil if addressed in Afrikaans—but he will be just as difficult about it with an English-speaking fellow citizen as with a foreigner.

This clinging to a national language spoken by no one else anywhere (Afrikaans is *not* Dutch, just as Pennsylvania Dutch is not German; it is a highly bastardized dialect derived from Dutch), this insistence on Afrikaans, is perhaps the most cross-grained symptom of their neurotic nationalism. Afrikaans is a language unnecessary and useless. It is spoken by less than two million people practically all of whom speak English as well—and English is spoken by more than a half billion people on this planet. It has no tradition worthy of the name, it has little literature; to use it for science or technology requires borrowing all the technical words from some other language. It requires almost everything in South Africa to be printed twice; it requires wasted years of study to acquire a second daily language, when the time could be spent learning Spanish or German. It has no use at all save to shut out the rest of the world.

Which is exactly what many South Africans, most particularly the Afrikanders, want to do.

Many of them want to make South Africa self-sufficient in all respects; the policies of the present government are aimed at making the country independent both in food and in manufactured goods. They still would like to sell, but they don't want to buy anything if they can possibly help it, and aside from the regrettable necessities of trade they wish the rest of the world would go away and forget to come back. Clinging to a language which no one else can talk makes it easier for them to maintain this attitude. Psychiatrists have a name for this symptom when exhibited by individuals.

But since they still need dollar exchange they advertise heavily in our country to attract American tourists, then their real feelings toward outsiders show up in making it exceedingly difficult for a tourist to be admitted. We ran into this same curious ambivalence in two other small, nationalistic and suspicious countries: Indonesia and New Zealand—plead for tourists, then treat them like convicts being processed.

Despite everything, it is an extremely pleasant country to visit—if your skin is the approved color. Cape Town is English in the very nicest sense, Durban is much like Florida, Johannesburg is like a boom city in Texas. The Johannesburgers show an American enthusiasm for the new, the big, the different, and the expensive; they speak of how much things cost and of the big operations they are in with the unashamed candor of a Texan or a Hollywood movie producer—they are so un-English that it is a bit of a shock to run across a cricket field there.

But most of all, the beauty of South Africa makes one gasp.

The *Ruys* was a very sociable ship, particularly with the South Africans aboard. There was a party of some sort almost every night; the ladies dressed for dinner and most of the men did, too, either in evening clothes or summer whites. On New Year's Eve there was, of course, an especially big party.

I was away from the ballroom floor for a few minutes to replace a dress shirt that I had melted down. When I returned, a tall, handsome man was kissing my wife. Gathered in his left arm was a plump blonde, apparently a reserve.

When Ticky was able to talk she said, "Dear, I want you to meet Sam."

Sam stuck out a hand—a third one, I think—and shouted, "Hi, Bob! Have a drink! It's my birthday." He was red-faced and his shirt had melted down, too, but he did not seem to care. There were three silver ice buckets each with a magnum on a table by him; I congratulated him, sat down, and started sopping up champagne. Sam sat down with us for a moment, then got up hastily. "I missed one! Be right back—" He dashed across the room, grabbed another female, and bussed her.

He ran down the whole female, first-class passenger list, plus the stewardess—who was not the usual old biddy, but should have been on an airline. I poured more of his champagne and hoped that there was no trench mouth aboard.

This was how we happened to drive across South Africa.

Sam invited us to do so with him about ten minutes later. The next morning it appeared that he had not forgotten it and really meant it. For the remainder of the trip to Cape Town we were bombarded with advice from other South Africans not to do so; according to them the Karoo Desert through which we would drive was unbeautiful, uninteresting, and unbearable in the summer; we would be hot, dirty, miserable, and bored—take an old hand's advice, son, and take the Blue Train, or fly.

At last I got a little huffy about it and told one of them that we would go with Sam if we had to walk, dragging our sled behind us; he had *invited* us, damn it, and that was more than anyone else had done! It shut up the talk but did not change their minds.

They were wrong. We enjoyed every mile of it.

We arrived in Table Bay early in the morning, as usual, and with the customary morning-after malaise from the Captain's Dinner of the last night. Even so, I found it possible to second Sir Francis Drake's logbook entry of 1580: "This cape is a most stately thing, and the fairest cape we saw in the whole circumference of the earth." The Cape of Good Hope is as lovely as its name.

Table Mountain, sitting over Cape Town and Table Bay, is a separate sight, some miles to the north of the Cape. The Table is a pleasing sight, but it is an ordinary mesa or butte, made exceptional by being the only one of its sort in the neighborhood, instead of being scattered around in quantity, New Mexico style. It forms a splendid background for an unusually lovely city.

My own first glimpse of South African life was of stevedores on the dock. They were resting and playing a finger matching game—a game which I had played the same way in school as a boy, which is pictured in murals in ancient Pompeii, which is played also by the Australian aborigines, and by Hawaiians half a world away from Cape Town. This may have some great anthropological significance; for myself I was simply delighted with the odd fact.

We were processed with exasperating slowness. It was long past lunch time before we were through customs. The customs examination was not outstandingly lengthy itself and we had Sam with us to smooth the way; the only mild hitch came over cigarettes. We had taken ashore the number which the regulations appeared to permit free of duty, but somehow we were wrong. I never did understand just how we were wrong, but it may have been that a single customs return for husband and wife was allowed one exemption, not two. In any case I was told to pay duty on half the cigarettes we were taking in for our personal use and I did so; the duty amounted to a hundred per cent.

In the mean time Ticky was poking me in the ribs and urging mutiny. Her ultra-free soul had already been tried that morning by some exceptionally silly immigration questions. "Don't pay it!" she whispered, loud enough to be heard back on the ship. "Tell him to go to the Devil! If they don't like it, we'll go back aboard and not spend a damn cent in their confounded country. We aren't even asking to take enough in to last us through—it's an outrage!"

The cost was not much but with Ticky it is always the principle of the thing—mere expense never fazes her. I hurriedly promised to skin her alive and sell her pelt and hustled her out of there. Sam and I closed in on her from both sides and marched her away while the customs officers pretended not to hear and looked smugly pleased. We found a taxi and headed up town.

The plan was to pick up Sam's car, load all baggage in it, then see Cape Town. Departure into the desert would be made at sunrise the next morning. We would sleep aboard ship, as there were no hotel rooms to be had in Cape Town, it being the tail end of the holidays. In fact there were no train or plane reservations to be had for the same reason; had we not stuck with Sam's offer we would never have been able to cross Africa while the ship went the long way around the coast.

Sam lived in Johannesburg and had left his car in the company garage of the Cape Town firm he represented in the north. We drove out to the plant and Sam left us with one of the company officers while he got his car. This gentleman was affable but I at once ran into something which seems to me to characterize the odd attitude of South Africans toward Americans. This man, whom I shall call "Mr. Smith"—he was not an Afrikander—said to me, "New York is filled with gangsters, eh?"

I silently cursed Hollywood for the distorted impression of the U.S. given to the world by the movies and answered as quietly as I could, "Why, no, I wouldn't say so. Most of that sort of trouble died out with the repeal of Prohibition."

Mr. Smith looked startled and said, "You misunderstood me. I meant the businessmen in New York."

It seemed to be an unanswerable remark. Sam arrived with his car at that point and saved me from having to cope with it. But I asked him about it once we were out of earshot. "What did he mean?"

"Oh, that—" Sam frowned and answered, "Nothing, really. It's just an expression. It means a man who is a good bargainer, aggressive. Almost a compliment."

"It did not sound like one."

"Well . . . some people aren't very tactful."

I shut up as Sam obviously did not like the subject. But I do not think the term was complimentary; I think it was a smear name used so habitually by them about us that "Mr. Smith" forgot himself. From this and other remarks I reached the conclusion that the notion that Americans are all gangsters in business matters is something that "everybody knows" in South Africa.

I am not an economist and I certainly shall not attempt to psychoanalyze an entire nation. But one does notice attitudes and there is always the itch to try to understand why. I confess that with respect to South Africa I could never figure out why . . . why the United States was regarded with a mixed aggressive-defensiveness.

The reasons why we aren't liked in many nations are fairly obvious and have been discussed too often to warrant rehashing here, but none of the usual reasons seem to apply in South Africa. The Union of South Africa is not even faintly communist, so that cannot be the source. "Dollar Imperialism" does not seem to be the trouble; while we have a little money invested there, you will not find American trade names spread around and American businessmen are conspicuous by their absence. We certainly have not displaced South Africa from world leadership, nor has South Africa experienced the sour taste of gratitude, either during or after the War—her role was more like our own, on a smaller scale.

It is true that we are the main bulwark (perhaps the only one) between them and conquest by Moscow, but they certainly do not seem to be aware of it, so they can hardly dislike us for that.

One remark we did hear repeatedly; someone would say that he would like to buy this or that, made in America, or would like to travel in America, but "—we can't get the dollars, you know." This remark was always delivered accusingly, as if it were the fault of the United States and of this American, myself, in particular.

We tried to point out that American goods were very nearly forbidden entrance to the Union by embargolike restrictions placed by South Africa itself; we got nowhere. As for dollars for travel in the States I pointed out that there was an open-market quotation for South African pounds on the New York market; their money was acceptable.

This last was greeted with a shake of the head. "Oh, no! Currency restrictions, you know. We can't get the dollars."

The currency restrictions are entirely those imposed by South Africa, not by us—but it is true that South Africans are not permitted to take outside enough money for much travel. (When was the last time you met a South African tourist in the States?) This is an odd status for the nationals of the world's biggest gold producer. South Africa mines over half a billion dollars in raw gold each year, almost half of the free world's supply and enormously more than we produce. Yet her gold reserves are small, her national debt is very large (proportionately about the same as ours), and her currency is "soft" and is kept near par by drastic exchange regulations.

The conventional answer is that they are helping England, an answer I don't understand as there is no love lost between Dr. Malan's government and England. The conventional solution offered by South Africans is that it is up to the United States to do something about it, to wit, devalue the dollar.

I was first tackled on this subject as soon as I boarded the *Ruys;* a Johannesburg businessman and financier asked me how soon I thought the United States intended to raise the price of gold? I answered in some surprise that I did not know it was in the wind.

He seemed startled at my answer and made it clear that he thought it was a certainty; the question was when? Later I heard him discussing my answer with another Johannesburger; my answer seemed to worry both of them.

This subject came up again some weeks later with an entirely different group of South Africans. Ticky and I were invited to have a drink with this group; the moment we were seated we were tackled bluntly and aggressively: "Why doesn't your country buy our gold production at sixty dollars an ounce?"

The tone was truculent; I could see that I was already accused, tried and convicted. But Ticky took over. "Why *should* we?"

"Eh? It's obvious. You can't expect us to buy your goods if you won't buy our gold."

"We *do* buy your gold . . . all of it you offer to sell, at thirty-five dollars an ounce."

"But you ought to pay more. You ought to pay sixty dollars an ounce."

We had heard this a wearisome number of times; Ticky rapidly reached her flash point. "Why should we? You wouldn't buy our goods if we did so; you've rigged your laws to shut us out. What sense is there in digging gold out of Johannesburg, us paying you sixty dollars an ounce—and then sticking it back in the ground in Fort Knox? What's sensible about that? If you don't like the gold price of the dollar, why don't you keep your gold and go on the gold standard yourselves? Then you could set the value of your pound at anything you wanted to and it would be hard money, at least as hard as the dollar. You could buy anything you wanted with it anywhere. That's all it takes; just quit complaining about the price of the dollar and go on the gold standard yourself!"

There was a shocked reply amounting to, "Oh, no, we couldn't do anything like *that!"*—as if Ticky had said something in terribly bad taste. No counter argument was offered and the group broke up with considerable chilliness on both sides.

I know that Ticky is not much of a theoretical economist and neither am I, but it does seem to me that there was more hard sense to her side of the argument than to theirs. I am not going to go into a discussion of the merits, demerits, and effects of devaluation, inflation, etc.—but I can't see anything in their argument but greed. It seems to me, too, to be a greed that is utterly reckless of the consequences on others; I may be wrong but I suspect that sudden devaluation of the dollar at a time when all other currencies are keyed to it might set off the biggest crash in history.

But this curious delusion that we are deliberately and wrongfully withholding their lollipop, from sheer meanness when we know better, may be the key to the oddly ambivalent attitude that we ran into all through South Africa. They have cast Uncle Sam simultaneously in the roles of Santa Claus and of the Devil.

After we left the factory of Sam's firm he dropped us downtown; we set out to do some sightseeing. Time being limited I hired a taxi—a licensed guide and tour car seemed unnecessary since it was an English-speaking city. Taxis park in the middle of the street in Cape Town; I located one and asked the driver for a rate by the hour.

There was no rate by the hour, only by the mile . . . so I told him what we wanted to do and asked approximately how much it would cost by the hour. His answer indicated that we would probably cover twenty to thirty miles in city driving in an hour, which seemed reasonable, so I hired him, telling him to drive us around the city and point out the sights to us.

Thereafter we got just one piece of "information" out of him; I asked him how many people there were in Cape Town. He said that he did not know exactly but it was somewhere between eight and nine million. I did not argue but contemplated the beauty of it. Cape Town is actually a little over half a million and looks smaller, as much of the city is spread out down the Cape peninsula in formerly independent communities. The downtown part in front of Table Mountain has a lazy, sleepy quality more suited to a much smaller community and the suburbs are garden villages—the whole city is lovely.

Our driver immediately thereafter lost all command of the English language. Instead of driving us inside the main city he hunched over his wheel and tooled his car out into open country as quickly as possible; once on the open road he stepped his speed up to about sixty or better and held it there. Protests had no effect.

Having dinner in mind, I had set a time limit of two hours; he delivered us back into town and to the gangway of the *Ruys* exactly on time—having accomplished the maximum mileage possible without fatal accident. I paid the exact amount without a tip. But I was unable to be really angry at the trick he had played on us; by pouring on the gas and running up the mileage he had managed to take us all around Table Mountain and far down the Cape on a tour which we had reluctantly decided to forgo through lack of time. As it was we saw almost everything usually covered in a leisurely full-day tour.

But the scenery certainly whizzed past.

What we could see of it looked good. There are beautiful homes and gardens in the hills back of Table Mountain, fine bays and beaches and impressive formations, in particular the Twelve Apostles on the Marine Drive down toward Hout Bay on the Atlantic side; these are a dozen rugged mountain bastions facing the sea which might be apostles or anything else but are worth seeing. As we swung across the peninsula to return we had our first view of the Indian Ocean.

On our way back to the ship we passed a Dutch windmill, a relic of early colonial days. Many of the houses in Cape Town show Dutch gables, a particularly ungraceful architectural conceit which is loved uncritically by the local gentry for its historical associations. Cape Town was originally settled by the Dutch as fortress and revictualing station for their ships sailing to the Indies; it was not intended to be a colony at first. It changed hands several times but the principal settlers were Dutch burghers and their slaves. As a result of the Napoleonic Wars the English moved in and hung on; freeing of the slaves, the famous Voortrek north, the creation of new states, the Boer War, and today an independent nation muttering about seceding from the Commonwealth all followed the advent of the British almost as historic necessities. It would be a deceptive oversimplification to say that the Afrikanders hated the British for freeing the slaves and are still sullenly determined, a hundred and twenty years later, to hang onto slavery—but this abstraction has an element of truth in it.

We arranged with the night steward in the *Ruys* to be called at four A.M.—a horrid hour—and asked could we *please* have coffee, or at least tea. A few minutes after we were called there came a knock at our stateroom door and there was, not the night duty man, but the incomparable Kwai Yau, bearing a big tray. He had decided that we should not start off without a proper breakfast and had gotten up even earlier than we had to prepare it for us. If Kwai Yau were not about fortyfive, with a home and family in Hong Kong, I would like to adopt him.

So we started out feeling merely a bit short on sleep instead of feeling three days drowned. It was not necessary to go through customs (which was not open then anyhow) since our baggage was all ashore; we merely had to present our gate passes and breeze on through. The early morning was chilly even though it was midsummer, January; Ticky had worn a coat. I had seen without noticing that she looked a bit lumpy in it.

Once outside the guarded gate she began shedding cigarettes. She had tucked packs of them all over her person; the number totaled exactly the number we had been required to pay duty on the day before. I looked on helplessly, then turned to Sam. "We seem to have a smuggler. Want to turn around and turn her over to the guard?"

Sam grinned and answered, "No time this morning. Some other time."

"I am *not* a smuggler!" Ticky insisted. "This is just the legal amount that I was entitled to, only you let 'em gyp us."

"Look, darling, the law is what the local authorities say it is, not what you decide it is."

"I wasn't going to let them clip us!"

"Why in the name of habeas corpus would you risk jail for a few shillings? You wouldn't like the food. If I ever get you safely back aboard the *Ruys* I'm going to put a collar on you and chain you to your bunk!"

She stuck out her lower lip and said nothing, so the discussion ended. Deep in my heart I felt the same way about it she did, but it is not good to encourage lawlessness in Ticky; she is too ready to slug policemen at any time. The spirit of anarchy on which our country was founded shows gene reinforcement in her . . . if it is a genetic factor, as I strongly suspect it is.

We passed the statue of Jan van Riebeeck, founder of Cape Town, and headed across the sand flats that connect the peninsula with the mainland. Along here are slums, shanties called *pondokkies* lived in by

"Capies" or Cape Town mixed-bloods. Cape Town itself seems to have no slums, for the reason that the natives and the "coloureds" live outside. This is a standard South African pattern; near every white city is a dreadful place called a "location" assigned to non-Europeans, where they may live out of sight of their legal betters.

After the flats we came to some lush farm land, then only twenty miles or so farther on we started up Du Toit's Kloof (or cliff), a steep climb up and over the mountains. Sam had a new Pontiac and was a skilled driver; we sailed up and up, through clouds and around sharp bends surrounded by fine rugged scenery. For the next fifty miles we seemed to be in Colorado.

Then we burst out of the last pass and into the desert—and had I been dumped there without warning I would have identified it as Route 66 through New Mexico and Arizona.

The only evident difference was that we drove on the left side of the road. Beside the road was a railroad that should have been the Santa Fe; around us was arid open range and distant buttes. We stopped at Laingsburg, one hundred and seventy miles from Cape Town, for a second breakfast. It was still only nine A.M. but it was already quite hot. Laingsburg looked like any of a hundred small highway towns in our southwest, with Bantus substituted for Indians.

The restaurant was no better and no worse than we would have found in the New Mexico counterpart; lamb chops and eggs and toast and coffee were substantial and well-enough cooked. Ticky reported that the ladies' room in the garage was spotless, as was that of the men—I mention these two points, cooking and rest rooms, because both were satisfactory-to-excellent all through South Africa, whereas they certainly were not in countries we had yet to visit.

The car had been parked in such shade as could be found but was boiling hot to enter nevertheless. Once on the road we were quickly comfortable. I shall mention no more about the heat nor the appearance of the desert; driving through the Great Karoo is precisely like driving from border to border across New Mexico and Arizona, minus the Painted Desert and the Indians. Some people cannot stand the dry desert heat in either desert. I like it.

The differences lay in *fauna*—the desert flora looked familiar, even to yucca under another name. I suppose the varieties were different and many of the species, but from a car window these were not noticeable to me—I can tell an oak from an elm, but just barely.

But African *fauna* are unquestionably African. Even the cattle are different, most of them being Afrikander cattle, a breed almost as rangy as a longhorn but without quite so much spread to their horns. Each of the cattle had two companions—tick birds.

There are two entirely different birds in South Africa known as tick birds. One is a little brown fellow about the size of a robin which you will see mostly in the bush, crawling over deer and searching for ticks, as busy as a pup in a flower bed.

The tick bird of the rhinoceros may be a third sort; I'm not sure. But the most prominent feathered friend called a tick bird is what we would call a snowy egret. Yes, I mean the bird which, if you are caught with its plumes in the United States, the Man puts you in jail and welds the lock solid. They may be a slightly different variety but the difference would matter only to another egret. (I may be weak on botany but I once won a prize for identifying birds . . . another bird guide.)

The pastures in South Africa are cluttered with white egrets.

They have the silliest way of behaving of any bird I ever saw (except possibly the Magnificent Bird of Paradise of Australia; we'll get to him later). The egrets stand guard over the cattle, two to each beast, one on each side and facing forward at attention, solemn as sideboys and perfectly motionless. They look as if they had each been assigned to that post by the sergeant of the guard and did not dare stir until relieved.

They are an unbelievable sight when first seen and they are still impressive after one gets used to them—which one does, for there appear to be exactly twice as many tick birds as cattle in South Africa and there are an awful lot of cattle. These tick birds introduced us to a springbok whom I will always cherish.

The springbok is a type of gazelle which is the national symbol of South Africa. Almost everything there is "Springbok"—the national airlines, a chain of theaters, the trademark of the government tourist corporation, their national teams in sports, almost anything you might expect except their Boy Scouts who are "Voortrekkers" instead. Springboks used to be exceedingly numerous; now they are common but not in the great herds they used to exist in. I heard a story about this which sounds incredible but which is told soberly: the springboks are alleged to have committed a lemming-type of mass suicide . . . poured out of the bush in countless numbers, pressed on to the Indian Ocean, waded in, drank sea water, and died.

If this is true, it is at least as hard to explain as any of Dr. Rhine's ESP researches. In any case, springbok are now not so numerous.

Our first springbok came to our attention through watching tick birds. I had kept my eye on them because I could not figure out what they did for a living. Their passion for standing sentry by cattle did not seem to fill the craw; we never saw one stop to eat, not once—yet birds have a very high metabolic rate and must eat, early and often.

We had crossed the Orange River into the Orange Free State late that first day and were in green, fenced pastureland rather than open, arid range; cattle were more numerous and so were the egrets. Suddenly Ticky said, "Look!"

A springbok had jumped the fence and was mingling with the cattle, off the road to the right. Sam slowed to a crawl and identified it for us. But this creature had not crashed the party to enjoy the superior salad inside the paddock, oh, no! He was a practical jokester and he was there for the sole purpose of chasing the birds. He would advance in a series of graceful leaps, duck his head and butt an egret; the bird would squawk indignantly and fly away.

He did this again and again. The cattle went right on grazing and the other tick birds each stood fast, staunch as the boy on the burning deck, right up to the horrid but inevitable instant when it was fly or be knocked silly. The springbok cleaned the silly creatures out of that pasture, then jumped the fence again and trotted away, perhaps in search of more tick birds.

We asked Sam if they always behaved that way. He said that it was the first time he had ever seen it in all the years he had been traveling commercially along the highways of the country. We concluded that this our favorite springbok was a deviant, as exceptional and as touched with genius among his sort as was Mark Twain or Thorne Smith among us.

The Southern end of the Karoo is very dry and is sheep country. A little farther north the range improves and is cattle country. With the cattle come the tick birds and, as the country gets greener, more wading birds, storks, cranes, secretary birds, and others. There were ostriches, too, but I believe that all we saw of these were domesticated. Much of the land is ruined for farming by termites; their hills are often so thickly clustered as to turn otherwise level ground into badlands. The hills come in three types, tall church spires up to a dozen feet high, little mounds the size of a bushel basket or larger, and big mounds which are almost small hills or *koppies.* The dried mud, after having been chewed by the white ants, is a concrete too hard to break with a plow and apparently not soluble in rain. If the Martians ever have to decide who really owns Africa they will probably award it to the termites on adverse possession.

We stopped for tea at Colesberg in Cape Province just short of the Orange River. This town did not have a U.S. southwest appearance but was much like a county seat in Iowa or northern Missouri. From there on through the Orange Free State and across the Vaal River into Transvaal the country was green and lush, like the best of our farm land in the middle of our country. Having traveled more than six hundred and fifty miles we stayed that night at Bloemfontein, capital of the Free State and site of the famous Harvard Observatory. As usual, Sam seemed to know all the girls there; we had stopped several times on the way up to greet his female acquaintances, once right out in the middle of the desert when he spotted a familiar female face back of the wheel of a car coming toward us at a relative speed of a hundred thirty miles per hour. I was gathering the impression that Sam managed to stay a bachelor only by being constantly on the move.

The hotel was delightful and modern in equipment, but old enough to have fine, big rooms and ample baths. In South Africa they do not think a request for a private bath an eccentricity and are prepared to satisfy it. By request, a Bantu knocked on our door at five-thirty with tea for an eye-opener; this is an English custom we would do well to imitate on mornings requiring early starts. It is more effective than a cold shower and much easier to take.

Unfortunately my eyes were not open when the knock came. I forced myself out of a warm bed, grabbed blindly at my robe, and in so doing snatched my glasses off the night table. They hit the floor with a pretty tinkle of broken glass.

I am the sort of person who needs to put on his glasses in order to find his glasses. Being so dependent I am not careless enough to travel with only one pair, but a second pair had been broken the day before during our wild ride around Table Mountain; I was rapidly reaching the point where I would need a little boy to lead me around.

I turned to Ticky, still snug in bed, and said, "Now see what you've done!"

She raised her head and blinked at me. "You spoiled the loveliest dream—I was home. What country is this? And what have I done?"

"Africa. I've just broken my other glasses."

"Poor baby! Poor stupid baby . . . how did it get to be Africa?"

"I don't know. If you had gotten up and answered the door like an ever-loving wife, I wouldn't have busted them."

The polite knock came again. "You're the one with one slipper on and a robe partly on," she pointed out. "You can bring me tea in bed and after breakfast we'll see what can be done about your glasses."

Some women are heartless. I brought her tea in bed, then took a look out into the corridor. Sam's shoes, freshly polished, were outside his door and so was his tea; the night man had been unable to wake him. I kept at it until I woke him, along with everyone else in the corridor, then went back and gulped my tea and felt sorry for myself.

I told Sam about it at breakfast. "Do you suppose we can find a dispensing optician? Our schedule is so confounded tight that I'll have to get them fixed on the fly; the *Ruys* sails for Singapore the very afternoon we reach Durban."

He frowned thoughtfully. "We would have to waste more than two hours here until one opens, when we ought to be chopping a hundred miles off the road to Johannesburg—it's still more than three hundred miles. Just how bad off are you?"

"Not too bad for the moment. I still have an old pair left, with an obsolete prescription I can get by with. But I hate to think of all those weeks to Singapore with the wrong specs. Look, let's find an optician in Johannesburg and I'll have him airmail them to Durban."

"Today is Saturday. I think they'll all close at noon."

"Lordy! Any chance we'll make it by noon?"

"I doubt it. Possible . . . if we all lean forward all the way."

"Then let's lam out of here and get rolling!"

"Finish your coffee and quit worrying about it."

I sighed. "You've got twenty-twenty eyesight. You don't know."

"I said not to worry. I'll get my girl friend to take care of it."

"Huh? Which girl friend? Be more specific."

"The one in Johannesburg."

"Only one in Johannesburg? I thought it was a big city."

"Don't be rude, dear," Ticky advised me. "Sam is trying to help you." She turned to Sam. "He's a beast at this hour, Sam, but useful once the sun is higher."

"I wasn't being rude," I objected. "I just thought Sam made them queue up and show a priority. I admire him. I wish I were like him."

Thereafter the conversation rapidly went to pieces as Ticky tried to make logical her assertion that she thought Sam was wonderful but would break both my arms if I tried to emulate him. We let it rest that Sam would ask his girl friend, serial number one, class Joburg, to have the glasses repaired in time for us to pick them up on our return to the city en route to Durban. I felt very happy over the whole thing; my megrims rarely last past breakfast. I have a sweet disposition and children love me.

During that morning we gradually got into more densely populated country. It was still farm country, but with more cropping and fewer range animals. Wild life almost disappeared except for an occasional meerkat (or "mierkat" or "meercat," take your pick). This little mongooselike critter loves to streak across the road just ahead of cars. Too many of them don't quite make it; we saw their pitiful little bodies oftener than we saw the grey blur that marked where one had just been.

As we got closer to Johannesburg we saw an occasional mine tailing among the farms. The Witwatersrand gold field is the richest gold strike in history—possibly the Incas had something better; if so, it has been lost. It is an underground reef of gold at least sixty miles long and is regularly showing new and unsuspected wealth. Some of the mines are down more than half a mile below sea level, nearly two miles straight down from the 6000-foot plateau on which the Golden

City rests. At those awful depths you can put your ear to a rock pillar and hear the stone creak with the incomprehensible weight resting on them.

We arrived in the city proper about one o'clock, too late to find an optician open, but I was no longer worried. We looked up Sam's girl friend, Ida, who was a tall, supple, blonde creature and a professional model, and Ida's sister Laura, who was tall, supple, and brunette and should have been a model but was not, through some oversight. Sam's plan worked out save that it was Laura who took my problem in hand and agreed to see to it that my two pairs of spectacles were repaired. After that they took us out to see the city.

Johannesburg is a seething million people today, where only seventy years ago were only fields of mealies. The town is booming more than ever and buildings are shooting up as in Sao Paulo. It looks like a mixture of Pasadena and Hollywood, with beautiful gardens, fine parks, and one of the world's most nearly ideal climates, its elevation keeping it from being too hot and its location only a few miles below the Tropic of Capricorn insuring that it is never cold. Its wealthy whites, of which there are many, run to private swimming pools, garden parties, and swank country clubs.

More than half, about six hundred thousand, of the population is non-European, Bantus and a smattering of East Indians. The Hindus are the retail merchants; an "Indian store" is anything from a country general store to a fashionable downtown department store. (We saw a sign in one: "Dogs and barefooted people are not allowed on the escalator.") The gold industry employs about 300,000 of the blacks, most of whom are contract laborers whose families, if any, have been left back on a reserve and who themselves live in barracks near the mines. Most of the others live in the native locations outside of town. These locations are sometimes shanty towns and are sometimes rows of mass-built little one-room boxes, grim and kennellike.

Some of the native population simply drift on the town, without visible occupation or residence. Their presence there is illegal under the *apartheid* laws and the police and the courts are constantly catching them and imposing sentences which have the effect of forcing them to hire out to the farmers, but they are as elusive as smoke and there are always more to replace those caught. These are natives of what anthropologists speak of despairingly as "fringe" culture, no longer of their ancient culture, not yet part of the new. These drifters have the whites constantly worried. It is not safe to park an automobile in downtown Johannesburg in broad daylight with all doors and windows locked, unless a constant watch is kept on it. The drifters working in pairs, one with a polish rag as camouflage and the other with a tire iron or other jimmying tool, will break into it and loot it, right under the eyes of a crowd of people on the adjacent sidewalk.

At night the streets of Johannesburg are not safe.

We were surprised to see black policemen there. However they are intended only to restrain their own race, they are not armed, and have conditional authority to arrest a white man only under extreme circumstances to prevent immediate violence and then only until a white policeman can be summoned. I never heard of one doing it, even so.

Despite the black cloud of potential racial trouble brooding over it Johannesburg deserves its name of the Golden City. It is young, beautiful, lusty and cheerful. From the many high points in the city you can see that it is surrounded by hills of brown mine tailings, which grow even faster than the constant efforts to plant and garden them. Its white homes are luxuriously beautiful and its downtown district is as modern as any and made exotic by Bantus of both sexes and many tribes in savage splendor only a little modified by white customs—the women cover up a little more but it is not unusual to see a "blanket" man who refuses to wear trousers of any sort and covers up his nakedness with a large blanket. The natives are free to come into the retail area to buy during daylight; curfew must find them out of town, or in the quarters of their white employers.

We were to leave that evening early for the big game country and had to pick up a railroad ticket. I had attempted to make a round trip reservation for us from Johannesburg to Nelspruit and return while we were in Cape Town; a telegram received in Johannesburg confirmed the trip out but not the return trip and advised me to pick up the ticket at once.

I discovered that buying a railroad ticket in South Africa is considerably more complicated than getting married in Nevada. But my good angel, Sam, got me through it.

First we went to the city railroad station, an enormous place suited to the busiest railroad junction in the country and a city of a million. However, over the weekend it closes like everything else, even though the trains still run. All the ticket windows were closed but I had been told to go to the "Emergency Booking Office"—in South Africa, buying a train ticket on a weekend is classed as an emergency.

We managed to find it hidden away far from the main hall. There was a clerk there, doing nothing, and he had a record of my reservation but was disinclined to issue it; instead he lectured me on doing things properly. I tried to explain the circumstances that had forced me into the course of action I had followed, but Sam stepped on my foot and addressed him in Afrikaans. With great deliberation and reluctance he issued, not the ticket, but a document which authorized me to go to another part of the station, knock on a door, and ask another clerk to sell me a one-way ticket; he refused to sell me a return, on the grounds that I should have gotten there sooner. Two processes took the best part of an hour—the railroads are government-owned, of course, and have no competition other than from other government-owned bus and air systems.

We then rejoined Ticky and Sam's friends. Sam warned me that we must be down at the train at least thirty minutes before train time—forty would be safer. I wondered why, since we had tickets and a sleeper reservation; I did not understand the explanation but we took his advice, which was excellent. Instead of being able to go directly to our car it was necessary first to push through a crowd gathered around a bulletin board on which was posted the train's diagram of reservations; from this we found out where we were supposed to be. Then it was necessary to look up the conductor of the train on the platform, check in with him and have some more mysterious paperwork done, a lengthy process since a couple of hundred other people also wished to see him for the same purpose. We got aboard just barely in time.

I had time while waiting in queues to ponder the purchase of two tickets in Chile for a train ride of the same order of mileage—much shorter in time because Chileno trains run very much faster than South African trains (the crack Blue Train, the limited from Cape Town to Johannesburg, averages a dizzying thirty-seven miles an hour). In both cases we had been dependent on the kindliness of a local citizen to catch the trains at all, but under Chileno rules Mr. Thackeray had purchased our tickets in about seven seconds and had had us actually aboard in another fifteen seconds whereas Sam, sophisticated in the red tape and knowing the inner-sanctum language, had been forced to waste two hours of his time in two trips to get us on a train for which we already had made reservations before his efforts commenced.

As I recall, the Chileno railroads are government-owned, too—at least they operate without competition. On the whole, their equipment is poorer than that of the South African railroads. I am forced to the conclusion that the difference lies in the people, in some fashion.

At the steps of the train Sam kissed Ticky good-by and I kissed good-by both Sam's (Joburg) girl friend and her sister Laura, which made me one up on Sam for the first and last time. In a country that had polygamy those two sisters would make a wonderful package deal.

We sat down in our compartment as the train pulled out and proceeded to munch sandwiches that Sam had purchased for us in lieu of the dinner that we had not had time to get. The train had a quaint

1890 elegance about it, carved woodwork and pictures on the walls. The roadbed had been left over from 1890, too, although I've encountered some on the Main Line of the Pennsylvania which was equally bad.

The compartment was of a sort known as a "coupe," a wide seat for two running thwartships which could be opened out into two narrow single beds, one above the other. After a while a "coloured" came around and rented us bed clothes (they don't come with the ticket) and made up the bunks, which left no room for baggage or feet, so we went to the dining car, which was nice in the same out-of-date style; there we had tea and killed time.

Couples are located over the truck, the middle of the car containing compartments big enough for the largish Afrikander families. The location heterodynes with the roadbed to produce an exciting but not restful ride. Nevertheless we dozed until the attendant showed up with morning tea. I brushed off a blanket of coal cinders and looked out. At last we were in the African big game country.

The countryside along the tracks looked remarkably like Illinois.

Ah, the romance of the safari! Stalwart native porters, their ebony bodies glistening with sweat, lift up their burdens, balance them on their heads and set off single file through the bushveld. The professional white hunter, bearded and taciturn, scouts ahead, ready to bring down meat for the simple evening meal. Suddenly the number-one boy, his eyes popping, trots back to your spot in the safari. "Bwana!" he cries. "Come quick! Simba!" You rush silently forward, followed by your gun bearer. The beast—

You can do it this way, if you want to. The tourist companies will probably conjure up the ghost of Allan Quatermain, for a price. There are porters to be had in Africa and professional white hunters as well; you can have a safari of any sort you want, even one with artificial refrigeration.

But if your object is simply to get into big game country, the more usual way is to pick up the phone book and look up "Southern Cross Safaris" or some other of the safari companies. They will send around a car for you, of the largish sort used by airports which have a baggage rack on top; a uniformed driver will drive you out to the bush and keep you and the other tourists out of trouble with the dangerous animals. This is known as a safari.

Another way is to hire a taxi and go out on your own. This is what Ticky and I did.

There is nothing wrong with hunting lions in a taxi. I'm reasonably certain that Allan Quatermain would have preferred it to his six-span teams of "salted" oxen; it is faster, cheaper, and much more comfortable. At the railroad station at Nelspruit we hired a taxi, driven by a mother of three, an Afrikander farm wife. I can neither spell nor pronounce her name but it was something like "Morgan."

She took us to a hotel for breakfast, went home to feed the baby, then came back and picked us up and we went out after lions, in a "Henry J." American cars are preferred for the bush, as the roads are not really roads but tracks, and the superior ruggedness of any American car, even a little Henry J., is much appreciated. Nelspruit is the nearest town to Kruger Park, which is the place to go if you simply want to see animals and not kill them. Kruger Park is 8000 square miles of everything, from lions to elephants; it runs from the Crocodile River north to the "great grey-green greasy Limpopo River all set about with fever trees" where Kipling's Elephant's Child got its nose stretched for its 'satiable curtiosity.

It was a pet project of Oom Paul Kruger, who feared that the strange and wonderful wild life of Africa might be killed off entirely by hunters not content with a trophy or two, but who would often kill two or three hundred beasts in a day. The whole world can praise him for his foresight; here is a place where a hunter could kill a thousand head in a day if his shoulder could stand the shocks. Kruger Park has in quantity every major animal for which Africa is famous except the rhinoceros—and rhinos are preserved in another park farther south.

An hour's drive over good paved roads brings you to the gate of the park. Inside there is no pavement, nothing has been done to tidy up the bush (we would call it "jungle") save to cut tracks and to build widely separated rest camps with kraals to keep the lions out at night. The route to the park is through Swazi farm country, between fields of mealies and grass huts. Piccanins are beside the road here and there; as our car approached they always started dancing, a sort of a Charleston combined with shoving the arms in and out as if rowing strenuously. We stared.

"Why do they do that?" I asked.

"Oh," said Mrs. Morgan, "it's a welcome. They don't see many people out here, you know, and when one does show up they dance for him to show they are glad to see him."

We entered the park, paying a few shillings for the privilege, and started searching, driving slowly and always staying in the car as required by the rules. Almost at once we saw our first game, a buck kudu, which is a big fellow of the antelope type, with stripes, a goatee, and fantastic twisted horns. After that bucks of various sorts (and does and babies) came thick and fast; frequently we had to stop the car to let a herd of thirty or forty impala yearling bachelors wander across. The impala, pretty little things about the size of our eastern deer and very slender and graceful, were most numerous, but we saw a dozen other sorts, among them the crossword puzzle gnu, better known in Africa as wildebeest, which looks as if it had not been able to make up its mind whether to be a horse or a cow, got discouraged and decided to be a mule. It is remarkably untidy in appearance.

There were delightful little duikers, too, antelope the size of a fox terrier, so fragile in appearance that you want to pick them up and take care of them.

I was searching the grass on each side for lion; bucks are all very well but I had come half around the world to see lions, wild lions in the bush. I had been warned that it was the wrong time of year and that I could stay three weeks and probably not see one, but I was hopeful, even though braced for disappointment.

The way to look for lions is this: look at every one of the smaller, rounded termite hills that you pass. If it raises its eyes and looks back at you, don't get out of the car; it's a lion. So far I had seen hundreds of termite hills the right size and color but none that stared back. Ticky was watching ahead; I heard her shout.

"Lion?" I asked hopefully.

"No—*look!"*

Crossing the road was a warthog mama, followed in single file by four of the ugliest and cockiest piglets ever, each with its tail straight up in the air. Mother was a Miss Africa among warthogs, with fine curving tusks and a wonderfully misshapen figure. We watched them until they disappeared in the tall grass and nothing could be seen but mama's proud tail like a little flag.

Ticky spotted the first baboon, too, a big bull sitting up on a bare limb about ten feet off the ground—a lookout. Each baboon family posts a guard, against leopard primarily as the lion prefers venison.

Leopards are tricky things, rated by the great professional hunter Mr. J. A. Hunter as the most dangerous animals, worse than lion, elephant, or African buffalo. They will enter a car to attack a man, which the lion is most reluctant to do; every time we passed under a branch Mrs. Morgan made us roll up all windows, sweltering hot though it was in the thick bush.

Ticky spotted three more baboon lookouts, all in similar positions on bare, medium-high branches, while I continued my termite-hill check. A baboon can outdistance a leopard in the trees, given a fair start, even though the leopard climbs like a house cat. I had just looked up to admire one of Ticky's bull apes, then looked back at another termite hill.

This one looked back at me.

"Stop the car!" I gasped. *"Lion!"*

Sure enough, it was—a beautiful, black-maned male, about forty yards from the car. It lay still but never took its eyes off us. When I could stop trembling I got out the field glasses, and gave them to Ticky—after taking the first look myself.

Forty yards split by a magnification of eight is five yards through the binoculars. It brought him so close we could see the yellow stains on his teeth when he yawned. I am prepared to swear on a stack of Baedekers that a lion in the open is *much* bigger than one behind bars. I don't think it was entirely my excitement, either; I think they probably grow bigger out where they lead a normal healthy life—for a lion, not for impala—with fresh meat and enough exercise. I can't prove this but I think it is true.

Ticky handed the glasses over to Mrs. Morgan, then said, "Hey! There's his mate."

And it was. In plain sight, not ten feet from the male, was a lioness, also lying in the grass and watching us. We had been so intent on our first lion that we had not looked. "Maybe there are more around," Ticky said nervously.

"You look—I gotta get a picture of this one—these one—both of them." I did so and she did so, reporting that none of the termite hills on her side were staring at her. Lions do stare with the unnervous steadiness of one who is utterly self confident. I took the picture . . . and it turned out badly; not only was the distance too great for the only lens I had but apparently I was shaking like a bride, even though my own recollection is that I was cool, calm, and dignified. I now find it necessary to tell my friends when I show it: "It really is a lion—it just *looks* like a brown ant hill."

I realized at the time that the grass was preventing me from getting the picture I wanted so I did something that I certainly should not have done, something quite properly forbidden by the government of South Africa: I shouted at the beast.

The results were pretty good. The male raised up and started lashing his tail slowly and forcefully, while measuring with his eye the distance between us. But I did not get my second picture; Mrs. Morgan let in the clutch and we scrammed out of there. She did not scold me for it at the time, but she put all speed onto the car possible. Later she told me about lions, balked at getting inside a car, which had clawed all the tires to shreds, including the spare if exposed. I had no suitable comment.

When we were a short piece down the road and it was evident that *Felis Rex* was not following she slowed down again. Then I pulled one of the longest doubletakes on record: "Hey! That really *was* a lion!"

"Of course," Ticky said coolly. "That's what you came for, wasn't it? Who did you think it was? Bert Lahr?"

Then she stuck a match in her mouth and tried to strike a cigarette. "There was a lion," I said slowly. "There were two of them.

They were *lions."*

Shortly I was puffing a cigarette nonchalantly myself and feeling very good about it, as if I had just won a Pulitzer Prize. They said we couldn't find lions! Francis Macomber Quatermain can find lions any day—just step off the train and flag a taxi. When we rounded the next curve and saw a car stopped and people outside it I leaned out and said, "Don't look now but there are two lions just back down the road a block or so."

A man looked up from an open bonnet. "Thank you," came a clipped British voice, "but at the moment my engine is overheated. Tell them to wait; we'll be along shortly, I hope."

We drove on.

No more termite hills stared back at us that morning, though we stared at plenty. But one more alarm took place: I had grown used to the routine of rolling up windows for every overhanging tree and was not especially surprised when Mrs. Morgan started rolling them up once without taking time to stop the car. I looked around, saw that there were no such trees. "What's the matter? Leopard on the ground?"

"Mamba!"

I was too ignorant at the time to be impressed. A green something slithered rapidly down out of a bush beside us and slid across the road with amazing speed—a snake more than six feet long and as thick as my wrist. Even in my ignorance it looked mean. Mrs. Morgan got us well out of the neighborhood as fast as the little car would go.

The mamba is the subject of many grisly stories in the bushveld country, most of them depressingly well authenticated. Its bite is much more poisonous than that of our rattlesnake; seven minutes from being bitten to death in agony seems to be about the average. If struck, you may possibly save yourself by taking a bush knife and whacking off, without any delay at all, the bitten hand or arm or foot. Worse still, this snake is not the peaceloving gentleman the rattler is; it seems to like to kill and it is terribly fast; a mamba has been known to chase and catch a man on horseback, strike from the ground—and kill him.

The Afrikanders seemed very casual to us about the big carnivores; they are not casual about mambas.

We had lunch at a rest camp called Skukuza—tea and sandwiches served by a barefoot black giant who called me "Mahster"—a custom I was never able to get used to. Inside the kraal at Skukuza we saw two large dead trees which nevertheless appeared to be loaded with fruit. A closer look showed that the "fruit" were birds' nests, nests of the weaver bird which constructs a nest not unlike that of the Baltimore oriole. But, unlike the oriole, these birds are destructively sociable; once they pick on a tree, it is doomed; they turn it into an avian slum, building so close together that the tree dies. There is probably some deep moral lesson in this but my philosopher's license has expired.

During lunch it started to drizzle, which depressed me until Mrs. Morgan pointed out that rain would bring the game out; on a hot dry clear day the animals tended to hide in some shady cool place and wait for sundown. Sure enough, we saw more game than ever, mostly varieties of antelope, including eight of the rather scarce water buck, more kudus, roan antelope, wildebeest, eland, the lovely little duiker, and enough impala to cause traffic jams. We were rather bored with impala by now, pretty as they are, but we searched each herd carefully for zebra, as zebra have a habit of hiding themselves among impala in order to evade the lions—no luck, no zebra.

But there were plenty of baboons and swarming families of monkeys and all sorts of strange birds, including one called a bush turkey although he is not one. He is as big as a turkey but has a bill like a toucan, which makes him look as if he had put on a false face for Hallowe'en.

We came to a small natural clearing in which there was a herd which I at first mistook for gnus. Then I realized that these were bigger, thicker through the body, heavier in the horn, and most emphatically did not look like a frivolous cartoon of some other animal . . . most especially the bull of the herd did not look like a joke. He looked like Satan himself headed for a coven.

"Buffalo," Mrs. Morgan said softly.

I picked up my camera and rather shakily started to take pictures. We had not expected to find buffalo. Having found them I was not sure that I was glad we had. The African buffalo is mean, treacherous, stupid, and unpredictable. A high-velocity, steel-jacketed bullet will bounce off the boss of horn that protects his idiot brain. In size and muscle he gives much the impression of a medium tank.

I took several pictures while the herd gazed and the bull of the herd stared at us. Finally he started ambling toward us, then broke into a trot. Mrs. Morgan let in the clutch and we got away from there as fast as possible. Apparently the bull decided that his duty was done in chasing us away from his family; he did not follow us down the track. I do not know whether or not a Henry J. can outdistance an African buffalo on a straightaway or not, and I don't ever want to find out.

About twenty minutes and two hundred impala later we spotted two cars ahead of us, stopped under some trees. A car at rest is always a signal to approach cautiously and stop to see what they have stopped to look at; we did so. I craned my neck. "What are they look—*umph!"*

I found myself so close to a male lion that I could look down on the top of his head.

About ten feet beyond him was another male in the same pose, couchant. There should have been a flight of public library steps between them. There they lay, as steady as stone statues, and stared back at the dozen or so humans staring at them. They were both big, magnificent, black-maned beasts. I won't attempt to estimate their dimensions; I feel sure that the fact that they were uncaged distorted my judgment. But they were not small.

Nor can I explain why three out of three males that we saw were black-maned, since black manes are supposed to be scarce.

I should have been able to take a perfect closeup, save for one thing: the light was too poor for color film . . . late afternoon, under trees, and a fine drizzle. It would have required a flash bulb, and I certainly would not have fired off a flash in a lion's face even if I had had one—I don't claim to be bright but I am not suicidally stupid. Sure, sure, it says right here in the book that lions will not molest people in automobiles, but the lion might regard a flash bulb as a violation of protocol. Anyhow, lions have been known to take umbrage at the automobile itself and claw all four tires to ribbons. With lion no farther away than a parking meter I felt not at all anxious to call attention to myself.

So we stared and they stared. I don't know how long we stayed. The lions seemed perfectly willing to sit through a second show. After a long time Mrs. Morgan suggested that we had better be moving on if we were to get to the hippo pool before dark.

Either somebody moved the hippo pool or there was something wrong with the map we were using; we never did find it. Hippopotami are the only animals you are assured of seeing when you visit Kruger Park, because they always stay home in one curve of the Sabie River. Our guide had been there many times before; nevertheless we could not find it and lost so much time looking for it that we barely made it out the gate before sundown closing time.

I didn't care—we had seen four lions.

The booking clerk at the railroad station in Johannesburg had refused to give us a return booking from Nelspruit to Johannesburg and had given me a lecture instead. I had attempted to book our return as soon as we arrived in Nelspruit but had been told by the station agent there that it was too late to book except directly with the train conductor; he advised me to come down a bit early and see the conductor.

I was baffled. How it could always be the wrong time to make a train reservation, when we disembarked in Cape Town, when we arrived in Johannesburg, and when we arrived in Nelspruit, I did not understand and still do not. But there it was—jam yesterday, jam tomorrow, never jam today. So we hurried through an excellent dinner at the Hotel Paragon in Nelspruit—the Paragon deserved its name—and Mrs. Morgan took us down to the train in good time. When the conductor stepped off the train we planned to buttonhole him.

So did fifty other people. We didn't even get close to him. Not that it mattered, he was letting no one on. We did hear him tell one woman with a baby that she could stand up all night in the vestibule but that was the best he offered. It was a holiday crowd, returning from the seaside; even the seats in the dining car were occupied. The next train was twenty-four hours later and we had no assurance that we would be able to get on even that train—the station master either could not or would not issue reservations for it.

The railroads in South Africa are atrocious, not because of equipment but because of management—sort of a Long Island Railway on a grand scale. True, the equipment could be better in many ways, but the real defect seems to be a total absence of any notion of traffic management. The bureaucrats who run it seem to have borrowed a slogan from an earlier, ruggeder day in American industry: "The public be damned!"

This weekend was the end of a school holiday; any traffic engineer owning a slipstick, having access to the records of previous years, and possessed of enough savvy to figure his own retirement pay could have predicted the service needed that weekend after finishing the morning paper and still have had time to take a long coffee break. But oh no! they had to run it like a game of musical chairs, with children left standing when the music stopped as an expected part of the game.

I have already noted that it was Sam's hospitality and Sam's Pontiac that got us out of Cape Town; all trains were booked solid three days ahead—with no intention of adding more equipment. The same conditions prevailed all over the country. Compounding the annoyance was the barely veiled insolence of Afrikander civil servants, an attitude of who the hell are you to even expect to ride our railroads.

I would have no right to complain if it were not that South Africa maintains tourist bureaus in our own country which publicize, among other things, how wonderful their railroads are.

Sure, sure, I'm just a sorehead tourist who could not manage to get on the train he wanted—but note this: South Africa has plenty of coal and exports it. But Cape Town imports foreign coal, it being cheaper to do so than to bring it down from the north. Inasmuch as the country has a markedly unfavorable balance of trade and the government has a firm policy of preventing the importation of anything at all where it can possibly be avoided, this one fact seems to me to underline the inadequacy and inefficiency of their railroads.

The same Transport Commission which runs the railroads also runs the bus lines and the air lines. Competition is intentionally eliminated.

Never mind—I admit that their railroads, or any railroads, are better than the means Allan Quatermain used. Mrs. Morgan drove us back to the hotel; during the ride I arranged with her for her to drive us to Johannesburg the following day. We checked back in at the hotel and went into the bar lounge. We were soaked through from a drizzling rain while standing on the station platform, exhausted from a long day in the bushveld, disappointed at not being able to board the train, and we each needed about two ounces of universal solvent in a tall glass to place a warm glow over our homesickness.

The bar was closed.

It was the first time we had run into the British Commonwealth customs of "hours." I have been assured by others that "hours" are carefully arranged throughout the Queen's domain to keep a weary man from taking a drink when he needs it most. Actually, closing hours are not much trouble to travelers; they are exempt from most of the restrictions. I don't know how we got caught at Nelspruit as I don't know the rules.

Presently the manager-owner, a very nice chap, found us, condoled with us at not getting the train, and was hospitable—so much so that I never did get up the courage to say, "Hey, Mac, how about a drink?" After a while we went to our room. The beds were good, there was plenty of hot water; the Paragon really is a good hotel.

Mrs. Morgan picked us up in the morning and we set out for Johannesburg. This meant that we paid for another five hundred miles of taxi service, or a total of three days. One day by taxi to see lions seemed reasonable; that was what we were there for and we had already invested much time and money in the preparation. Two more days (one for her to drive us to Johannesburg, a second to return empty at our expense) seemed a little steep, especially as we held train tickets which had not been honored and which we could not cash. But it was either that or be stuck in the interior of Africa with a strong likelihood of missing our ship for Singapore.

Actually Mrs. Morgan charged about half what the same service would have cost us in Colorado, even though her little Henry J. represented an investment equal to a Cadillac and petrol cost more (and gave poorer mileage) than does gasoline in the States.

I have been told by South Africans that the Afrikander farmer is the laziest man on earth, given to sitting on his stoep, smoking his pipe, and watching his black farmhands make him rich. If so, Mrs. Morgan and her husband must have been exceptions. They owned and lived on a farm, which they worked through a black foreman. As is usual, his compensation was permission to crop part of the land for himself. They owned a general store for the natives, which was managed by a "coloured." Mrs. Morgan ran the Nelspruit Taxi Service and was its principal driver, although she had three children at home including a young baby whom she had to stop by to feed occasionally —she had, of course, a Bantu housekeeper-cook. And Papa had a full-time job as a boiler inspector on the railroad.

She told us quite simply that they wanted to make a lot of money. I'm sure they will.

Inside of ten minutes after leaving Nelspruit we were glad that the train had gone off without us. It was a glorious day and glorious countryside. The Transvaal is some of the lushest rolling farm land on this globe and I can understand how the Voortrekkers felt that they had reached the promised land when they reached it after crossing the grand but pitiless Karoo. All they asked of life was fertile land, cattle, and plenty of slaves to do the work—the simple things in life.

Nelspruit is not much above sea level. We climbed through the low veld, the middle veld, and the high veld in the course of the day, gaining more than a mile in altitude but so gradually as to be not noticeable. It was rolling, open prairie, lightly sprinkled with trees, like the best of our middle west farm country. The wide, almost flat-topped flamboyant tree, a trademark of South Africa, was usually in sight somewhere, reminding us that this was not the middle west, but a page out of the *National Geographic.*

There was also a little bird which did not look like home. It was known locally as the widow-of-paradise bird and looked much like a redwinged blackbird save that it had two long, black, floppy tail feathers, perhaps three times the length of its little body. These gave it quite unfavorable aerodynamic characteristics and it proceeded in series of frantic attempts to gain altitude to overcome the drag, then pulled down again, so that it traced a sine curve through the air. Nevertheless it seemed quite happy and no doubt thought that was the only way there was to fly.

In late afternoon we drove through Pretoria without stopping and turned south toward Johannesburg. Pretoria is a clean and beautiful small city of gardens and fine public buildings and is one of the three capitals of the Union, the seat of government—the supreme court is in Bloemfontein and the legislature is in Cape Town. In the outskirts to the south is the Voortrekker Monument and for this we did stop, it being a world-famous Afrikander shrine.

The monument is a large, square, ugly building of great dignity. It sits on a hilltop surrounded by a sculptured circle of covered wagons. The interior is empty save for an altar on a lower level which is struck by sunlight through a hole in the roof only at noon on December 16th, their national holiday. There are bas reliefs running around the inside which portray the struggles of crossing the desert, fighting natives, coping with broken wagons, *etc.* Ticky and I were struck by the strong resemblance in equipment and costume between these pictured pioneers and those of our own old west. Only in that the "hostiles" were shown as flat-nosed rather than hook-nosed could a difference readily be seen. The men wore spade beards, the women wore Mother Hubbards, the prairie schooners looked like ours. It made us think of the pictures and statuary of the Mormon Trek as seen in Salt Lake City —not really surprising since the Mormons trekked in 1847 and the Cape Dutch in 1838 and following. I could not forget, however, that the two sets of pioneers trekked for very different reasons: the Mormons were attempting to escape religious persecution whereas the Voortrekkers moved on (in part at least) because the British had freed their slaves.

Of course it does not look that way to the Afrikanders and no doubt this book will be added to the long list of books banned by law in South Africa. Mrs. Morgan evidenced the first emotion I had seen her show; she looked around at scenes of Boers fighting Bantus and said very solemnly and softly, "They did it for us."

The Voortrekkers seem to have won. The edict from London emancipating the slaves is still law but Dr. Malan's government has succeeded in substituting a serfdom for the entire black race which leaves the black man no more free than he was more than a century ago without putting the Voortrekkers' descendants to the inconvenience and expense of being personally responsible for the welfare of chattel slaves. (And on the other side of the world we are still persecuting the polygamous dissident Mormons of the Arizona Strip.)

There was a sign outside giving visiting hours and limiting "non-Europeans" to one afternoon a week. I wonder if any of them visit it.

Before I am accused of a double standard let me say that I am aware that our own treatment of the American Indians was in many instances a scandal and a crime, but we have made many amends. There is now no legal distinction between the red man and the white, save that the Indian may, if he wishes, avail himself of certain legal privileges denied to the whites. But he is not required to.

American Indian blood is a matter of pride with us today, e.g., Will Rogers. And we have had an Indian Vice President. I will concede that the Afrikanders treat the Bantus "no worse" than we have treated the American aborigines the day Dr. Malan has a black deputy prime minister. Oh, that will be a day!

Before somebody points out that the barefoot Bantu savage is not capable of full modern citizenship *as he is* let me concede the point—

and let me add that he never will raise himself up to the status of Dr. Ralph Bunche or of Dr. George Washington Carver as things are now; the Nationalist Party is firmly determined not to let him.

And in answer to that raucous voice in the back—the man with the sheet over his arm—let me say that my sister is already married. Anyway, it's her business, not mine. The meeting is adjourned.

South Africa has wonderful roads even if the railroads are a practical joke. We were in Johannesburg well before dark. It is a modern city even to its traffic jams, which would do credit to New York; it was well past dark before we reached our hotel. We took a quick tub and grabbed another taxi to a lovely home in the suburbs, owned by people we had met in the *Ruys.* We had cocktails by a swimming pool in a beautiful walled garden, dinner by candle light which was served by white-gloved black servants. I noticed that our hostess called her butler "Sixpence" and asked her what his real name was?

"Why, 'Sixpence,' " she told me.

"I mean his Bantu name."

She shrugged. "So far as I know, that is the only name he has." Then she changed the subject.

I learned later that "Sixpence" is the usual nickname of any Bantu male house servant. I had again shown a gauche ignorance of local custom. But in the United States even the goldfish have names.

In that household wardrobes and cupboards are kept locked, inner doors as well as outer are locked at night, the grounds are surrounded by a high wall and can be floodlighted. There is a story, possibly apocryphal, about a South African lady in Durban who was disturbed at the rumors of an impending native uprising. She called in her houseboy and said, "Sixpence, you wouldn't cut my throat—would you?"

He opened his eyes wide in horror. "Oh, no, Missy! I cut throat of lady missy next door—her boy cut your throat."

You hear this story in South Africa but the laugh is a little forced.

The next day we flew to Durban to join the *Ruys.* The ship was a DC-6B, a plane which appears to be the work horse of the world at present, just as its smaller and older sister, the DC-3, was for so long—not but what there are plenty of DC-3s still flying all over the world. Like the Model-T Ford, it is necessary to bury a DC-3 at a crossroads with a holly stake through its heart to make it quit flying.

As we took off from Johannesburg we saw that it was surrounded by manmade mountains of sulphur-colored mine tailings. That was the last of the scenery, as we saw nothing but the top sides of clouds from there to the coast. As a means of sightseeing airplanes are better than subways, but not much. So I looked at the hostess instead. As always, she was well worth looking at. I like to look at pretty girls and Ticky indulges me in this hobby, one which is, after all, inexpensive, harmless, and does not damage the goods. I hope to live to be a nasty old man, with that as my last pleasure in life.

The most nearly perfectly beautiful airline hostess we saw on this trip was a Polynesian girl, but this Springbok hostess was well up in the money. Presently she came over and talked with us. We learned that she was engaged to a doctor who had just left for postgraduate work in San Francisco. She had been unable to go with him because the terms of his fellowship required him not to marry for two years, and now she was worrying that he might forget her for some American girl. We assured her solemnly that if he did, he had rocks in his head—an obvious truth. But it did not console her. She told us that she would have been happy to go with him without being married, but she had not been able to arrange a visa that would let her work.

Sometimes I think the rules are rigged to require at least one fly in every bowl of soup. This planet is not too well run.

After the balmy veld and cool Johannesburg, landing in Durban was like being plunged in a steam bath. By the time we had landed and taken a long, hot, sticky ride to the docks we were tired and irritable. We then had to go through outgoing customs, a practice infuriating through its sheer uselessness, but one which I learned to take with a fixed smile and mendacious good nature.

Not so Ticky! We had to fill out long forms to get ourselves, our camera, and our binoculars aboard ship, which made the third time that we had gone through the rigamarole for South Africa alone. South Africa specializes in empty rituals to slow down the traveler, most of them having the flavor of children's games—"Penalty Square: Go Back Four Spaces"—that sort of thing. For example, Mr. Tupper, our jovial companion of the *Gulf Shipper,* got caught by their requirement of a cash deposit to insure that he would leave the country (we were excused because we had a ticket to Singapore). He put up the deposit in dollars, attempted to collect it when he left and was told that it was returnable only in South African pounds. He pointed out that he had deposited dollars but it did him no good to argue; they had planned it that way.

While I was filling out forms and trying to convince the customs officer that I could not show him the serial number of my camera because it was on the inside where it could not be seen without ruining a partly-exposed roll of film, Ticky was standing behind me making ominous teakettle sounds. As they began to boil over into recognizable epithets I finished hurriedly, paid some minor clearance fee, and rushed her out of there. As soon as I got her back aboard the *Ruys* and inside our stateroom with the door closed I started giving her what-for, explaining in short, bitter words that we were strangers in a strange land and that we had to conform to the local rules whether we liked them or not. Then I attempted to exact from her a firm promise never again, under any circumstances, to be anything other than cheerful and cooperative when going through customs, no matter how much it hurt.

Ticky stuck out her lower lip and looked determined and I found out why the word "obey" had become obsolete in the marriage service —I didn't make a dent. (I must read Robert Louis Stevenson's *Travels with a Donkey* someday. Is it possible that he was describing his honeymoon?)

Reconsidering it coldly and much later I am not sure that I was right and she was wrong. Men are much too law-abiding and will put up with nonsense that women know instinctively is wrong. Males receive a sterner discipline in childhood, then when they reach the age when they might break free of it they are usually subjected to a term of military service which leaves them forever after pliable in the face of queues, red tape, nonsense forms, and protocol for the sake of protocol—they disapprove but they conform.

Not so the female race! They evade or ignore rules and regulations wherever possible without the slightest feeling of guilt, and their husbands are often involuntary and unhappy accessories before and after the fact. Possibly this is a good thing, albeit uncomfortable for the male. Somebody has to strike a blow for freedom before we drown in a sea of red tape.

Speaking of donkeys, we almost bought one. The usual equivalent of a farm truck for a Bantu farmer is a long, narrow flatbed wagon drawn by four or six donkeys. Sam had told Ticky that these cunning little beasts cost only two-and-six, or thirty-five cents U.S., which seemed incredible. I asked Mrs. Morgan about this and found that Sam was almost correct, as she had just recently bought two donkeys for ten shillings for her farm foreman, the price per head thus coming to seventy cents or the price of a pound of butter in Colorado Springs.

Ticky immediately decided to take one back to the States as a pet.

I tried to argue her out of it, though I should have known better. Mere words have never affected the diamond-like quality of her will.

At last I dug into my pocket and handed her two half-crowns. "Here, buy yourself a donkey. You arrange deck passage for it, you get it through quarantine at Singapore—six months. Get it through again at Sydney and Auckland—anothcr six months each, I believe. Same for San Francisco. Write me a letter occasionally and tell me how you are making out."

She took the money and I heard no more about it. But much later aboard ship, when I needed change for something, she told me firmly not to touch the two coins on her dressing table because they were the money for the donkey. I concede the logic of it.

The ship stayed over an extra day in Durban which gave us time to go into Zululand. I wanted to go a bit farther into the game preserve at Hluhluwe (pronounced "shloo-shloo" as if you were rinsing your teeth) in order to see white rhinoceri, but it was just a few miles too far away; one flat tire and we might miss the ship. So we settled for Zulus and the shade of Umpslopagaas.

Mr. Brown, guide for Thomas Cook, Ltd., drove us north to Eshowe, capital of Zululand. I do not know what I expected to find; Zulu history was no part of my formal education and my impressions of the Zulu Empire had been derived largely from Sir Rider Haggard's wonderful but fanciful romances. However, Sir Rider was no mere spinner of fairy tales; his descriptions of the valiant Zulu impis, or regiments, of their military system and tactics, of their stern character, must be taken as factual; he had seen them at the height of their power just before their defeat by the British in the Zulu War in 1879.

What we did see was a rolling, sun-drenched land planted mostly in sugar cane but interspersed here and there with smaller fields of mealies (Indian corn), the staple of the natives. The hills were dotted with beehive grass huts. Here and there were women working in the fields. Along the roads were naked piccanins, older lads dress in breechclout equivalents of animal tails, barefoot matrons with the high hairdress of married women, adolescent girls with their hair short, and a very occasional rich native on a bicycle. Men were scarce.

The impression was one of overpowering, bucolic peace. It was hard to remember that these sleepy farmers had produced some of the bloodiest fighting ever seen before they were subjugated. Around the time of Napoleon, King Tshaka (or "Chaka"—their clicks are not equivalent to our gutturals) introduced the stabbing assegai, and a military enveloping tactic much like that used by Alexander the Great; he and his successors consolidated all of this part of Africa into an empire. Every Zulu man was a warrior.

The warriors now are pulling rikshas in Durban (still in full war panoply) or are houseboys to the whites. They must work, to pay their head taxes and to buy wives. But waste not too many tears on the lost glories of the Zulu warrior. The Zulu was a conqueror, enslaving and killing—then had the bad luck to meet someone with the same idea but with better weapons. Without defending British colonialism one may at least note that Victoria's troops did not indulge in senseless orgies of blood after a victory. It was Tshaka's habit to kill off all above the age of adolescence when he conquered a tribe. He is reputed to have killed seven thousand of his own subjects when his mother died.

Eshowe, where the Zulus laid siege to the British, is a peaceful modern village now, where the Queen's commissioner supervises the administration of law, tribal and the white law over it, through the paramount and lesser chiefs. My impressions of it are neat brick buildings, a movie theater, a soda fountain and news stand, and an excellent lunch at a clean, modern hotel. Allan Quatermain would never have recognized it.

After lunch we left the highway and drove far out into the fields to visit Ntuli, a native sculptor who enjoys a measure of world fame. His home was the usual group of beehive huts surrounded by farm land. He was not there but his daughter set out his wares and we bought a bust of a Zulu woman. His style is realistic and accurate, with neither the exaggerations of traditional African art nor of the blobs called "modern" in our culture. He shapes what he sees and his eye is good.

We paid seven-and-six, $1.05, for this bust; at these prices Ntuli has become rich, for Zululand. As we left we met him coming home; he was riding a bicycle while wearing a Harris tweed jacket, trousers, shoes, white shirt, and necktie. The weather was such as to make any clothing, any exertion, an invitation to sunstroke, but he kept the jacket on, a perfect classroom example of the symbolism which Thorstein Veblen says is the fundamental motivation of our own society. His outfit was a *reductio ad absurdum* of our own symbolisms in dress but was laughable only if we are willing to laugh first at ourselves—and concede every argument of nudists.

Speaking of nudity, most pictures in travel magazines give the impression that Zulus still dress largely in beads and feathers with the skin mostly uncovered and with the mammary glands living their own lives, wild and free. This is both true and untrue. Those same travel magazines give the impression that the residents of the American far west (of which I am one) dress only in high-heeled boots, Stetsons, and Levi's. I do not own high-heeled boots, although I live in cattle country. But my next door neighbor hardly ever wears anything else. Much the same thing obtains in Zululand; the traditional tribal dress, or lack of it, is extremely common on the reservation. But the Zulus one encounters on the road or in town look much like poor country Negroes of our own deep south, being dressed usually in shabby equivalents of white man's clothes. Our guide told us that the natives were required to cover up when they came into town and that the ones we saw on the road were mostly going to or returning from town.

This explanation satisfied me until later in the day. We had returned the hundred miles from Zululand and were driving through an expensive residential suburb of Durban, which is a wealthy modern city. Suddenly I saw on the sidewalk near us a white child about four years old who was being hotly pursued by a young Zulu woman. An open front door made it evident that the child had made a break for freedom and was being chased down by its nursemaid. The only oddity about the scene was that the young woman was naked except for something wrapped around her waist.

I called Mr. Brown's attention to it. "How about *that?"*

He frowned. "Well, it is not exactly against the law; it is just considered bad form."

That evening Ticky and I attended a performance of a company of the Folies Bergere; it had its customary nude tableaux, as naked as any country scene in Zululand. There may be some thread of logic running through our tribal taboo concerning skin covering but I am unable to figure it out.

The following morning we had a few hours free in the city itself; we spent it, without success, in tramping or riding from one steamship booking office to another, trying to tie down passage from Singapore to Australia. All we achieved was sore feet and a detailed view of downtown Durban. The city spread, along the waterfront the way Chicago sprawls along the Lake it is as modern as Chicago and much prettier. There are East Indians, Europeans, and Zulus in about the same numbers, each living in their own areas but mixing in the business district Except for some in the Transvaal this was our first encounter with the East Indians. They are merchants and businessmen of great skill, equal to or exceeding the Chinese. They save every penny, save for a prevalent weakness for powerful, flashy American automobiles, and many of them are extremely wealthy, although they were originally imported as coolie labor in the cane fields.

The blacks hate them. The grave race riots of recent years in Durban were between Zulus and East Indians; the British were not directly involved. They have a reputation for cheating the Zulus at every turn. I cannot vouch for this either way but it does seem evident that if unlimited immigration from India were permitted (which is what India wants) the Zulu, already crowded onto insufficient land by his present masters, would soon have nothing at all left. The Zulu is already extremely poor. The population density on his reservation land is already half again as high as it is elsewhere in the Union. He makes a slim living as a servant to the whites or working for the large corporate sugar cane plantations that surround his land; it may take him years to pay for his first wife. Marriage is expensive on their scale

—eight oxen for a healthy fourteen-year-old maiden, up to twelve oxen for a princess. (Prices are almost twice that high in Swaziland, I never learned why.) After sweating for years to pay the *lobola* for his loved one (don't let the purchase custom fool you; these are love matches usually), he may still have to live away from home most of the time to gain cash for taxes and necessities while his wife sweats in the fields to keep food in the bellies of the piccanins.

Underneath the Zulu is still a warrior; if he finds, or believes, that the East Indians are making his present almost intolerable lot still harder there will be more bloodshed.

We sailed from South Africa later that day with very mixed feelings. I think relief predominated. South Africa is a country wonderful, beautiful, and rich—and terrifyingly mismanaged. There is no indication of any possibility that it will gradually evolve into a better and more humane civilization; the dominant minority is grimly determined not to give an inch. The whip is still their answer to the mutterings and rumblings from underneath. Mau Mau has not yet reached South Africa, but it is only a few miles to the north and there are known to be secret societies spreading among the Bantus, brotherhoods determined to avenge their wrongs and waiting for the Day.

When that day comes the houseboy from next door will be waiting to cut throats. In the meantime I can't see a blessed thing that we can do to prevent it.

IX

We Learn About Oriental Service

THE DEPRESSION ENGENDERED by South Africa we shook off almost at once; the voyage across the Indian Ocean to Singapore was almost idyllically pleasant. The weather was warm without being hot, the sea was calm, the motion of the ship almost imperceptible. We had acquired status and seniority now; we were invited to the Captain's table. The day we first boarded the *Ruys,* when we had been intimidated by her size and luxury, frightened by the brisk, well-dressed passengers who looked right through us, seemed remote and unlikely. We were oldtimers who had been in the ship as long as anyone and longer than any but a couple from Buenos Aires. We were almost plank-owners and we enjoyed the status.

The crowd of first-class passengers was down to about half and still further reduced by East Indians who kept to themselves and by French-speaking Mauritians who kept almost as much to themselves. But there was a dance, or movies, or "horse races," or bingo, or some social event every night; there was a cocktail party before dinner each evening; there was swimming, sports, loafing, and long siestas in the daytime. It was hard to remember that somewhere over the wide blue horizon men were dying wretchedly in jungles, the veto was being exercised in the U.N., and the planet as a whole was moving steadily toward what threatened to be the final Armageddon. Under our keel slid the prehistoric continent of Gondwanaland and I lost the cribbage championship of the Indian Ocean—John Lloyd cut the jack when it was my first count and I was certain to go out. There ought to be a law!

John was a young Englishman fresh out of Oxford, who had joined the ship in Africa. Young, handsome, urbane, and invariably good-natured, he was an asset in any social group. When Ticky told him that his cumberbund should be Dubonnet in shade, rather than claret, he agreed, stripped it off and threw it overboard, and resumed dancing, all with smiling aplomb. (Ticky was left speechless.) We learned that he, like his father before him, had been a member of the "Gonfal Loungers" at Oxford, a club devoted to sitting on the steps in front of one of the buildings there and "observing ye good things God hath made."

"Women, you mean?" I asked.

"Oh, yes, but not necessarily. Just 'ye good things God hath made.' "

"Sounds like P. G. Wodehouse's Drones Club."

"Not exactly. Though I will say that some of the members of the Drones Club would be welcome in the Loungers."

In order to qualify for the Loungers after nomination it was necessary to get oneself arrested on Boat Race Night and be held overnight in jail. This, as John explained, was not easy to do—the second part, that is, about being held in jail overnight, because the University's proctors waited at the police station each Boat Race Night in order to take charge of any young gentlemen who had celebrated too boisterously; it was necessary to change one's appearance, accent, vocabulary, and manner so convincingly that a proctor with years of experience would not recognize the culprit as a University student and invoke the ancient immunities.

Another major asset was Bert and Molly, two Australians who sat with us at the Captain's table. Bert had been serving the United Nations all over the world for the past five years, as a forester in the Food & Agriculture staff. His last job had been to survey the potentialities of the Amazon Valley, and now they were returning home to buy a plantation in Queensland. Bert and Molly were as perfectly Australian as John was British—in accent, vocabulary, and attitudes. Bert maintained that all Australians grew to look like kangaroos; he illustrated it, with gestures, on himself and his wife. "They get long, pointed noses, ears that stick out, big soft brown eyes, and pear-shaped behinds. Watch for it, you'll see."

(When we got to Australia we could not help but remember this—and it did seem as if he were right. The power of suggestion, no doubt.)

There were Earl and Marianne, of Princeton, Buenos Aires, and Caracas. Earl was an investment banker by profession and a student of yoga by preference; he could assume the full lotus seat, then stand on his head—this, mind you, on the deck of a rolling ship. If you think this is easy, try just the first part: sit down on the floor and wrap yourself into the lotus seat, with the soles of both feet turned upwards in your lap. If you can untie yourself thereafter and walk away unassisted, you are about ready for your beginner's license.

There was the Captain himself, who managed always to be a warm and convivial host while continuing to be a very taut shipmaster. The *Ruys* was clean from stem to stern and perfectly run, but the Captain was always ready to dance all night and his table was usually about thirty minutes late for dinner because, ten minutes after the gong had sounded, the Captain would smile sheepishly and say, "I sink we haff time for annozzer one." So we would.

There were minor frictions, of course, such as South Africans demanding to know why we did not pay more for their gold, people who read us lectures on how the world would be perfectly safe if the United States would just refrain from trying to start a new war, and people who found everything about the United States just too dreadfully quaint and repulsive. Ticky and I tried to avoid such useless arguments but sometimes we were cornered. One South African demanded to know of me why Americans insisted on making such funny sounds instead of speaking English?

He himself was speaking a county dialect I could not identify but which I could hardly understand, but I pretended a politeness I did not feel and tried to explain that American was an independent variation of English, with its own spelling, pronunciation, and rules. This struck him as silly. So I asked him what English accent he wanted us to imitate?—Yorkshire, Oxonian, Cockney, Devon, or what? This ended the discussion without convincing either one of us.

The United Kingdom shows a much wider variation in speech in one tight little island than we do in our continent-wide spread. To have our American speech patronized sets my teeth on edge.

Ticky tangled to the point of brass rags with one Englishwoman in the ship. This female had insisted on inquiring into one aspect of our economy: "You don't really mean to tell me that you have to *pay* for medicines and hospital care? How dreadful! Why don't you have socialized medicine?"

Ticky glared at her. "We can't afford it! We've had to pay for *British* socialized medicine!"

I've tried to impress on Ticky the necessity of keeping her temper when needled, but I am afraid that she will never qualify for a job with the State Department.

But I have a sneaking suspicion that her uncivil hyperbole contains a legitimate criticism of most of our foreign aid program. Have we really been getting our money's worth in most cases?

We made only a dawn-to-dusk stop at Mauritius. Mauritius is a place I must have missed when I studied geography as a kid but it turns out to be a large and populous island. It exports sugar cane and imports everything else. The language is French, the flag is British, and the population is overwhelmingly East Indian. This is another one of those odd chunks of real estate that England took over during the Napoleonic Wars and never turned loose, like Tristan da Cunha, and, for that matter, South Africa itself. The dominant French population are largely royalists; they appear to believe sincerely that a restoration of the Bourbon crown would fix up all of the ills of France. I don't share the belief myself but I have no objection, as I doubt if it could make things worse. Port Louis is well equipped and beautiful but very busy; the *Ruys* had to anchor and we went in by launch. The shopkeepers, taxi drivers, money changers, and such are mostly Moslem Indians; the field laborers are Hindu; they look alike and have no use for each other.

I changed South African pounds for Mauritian rupees and we hired a taxi. A rupee appeared to be about nineteen cents but the three-way conversion was so complicated that I could not have solved it without a sliderule—if I was cheated, I never knew it. Certainly we were not overcharged in the long run, as a day's drive for four of us, lunch, beer, baksheesh, and the launch came to less than eight dollars each.

Port Louis is a picturesque and cleanly little town of narrow streets and cobblestones. We left it and headed around the island, which is basically one large, long-since-extinct volcano. It used to be covered with tropical rain forest; now all but about a fifth has been cleared and planted. As to climate one need only say that the inhabitants go to Durban, if possible, during the worst months to escape the heat—while the Durbanites are going to Transvaal or Cape Town for the same reason.

We stopped to see the botanical gardens, which are beautiful, old, and very lush. Ticky trotted happily around, pointing to things and spouting Latin, and I identified a mango. There were giant tortoises in a pen there, which looked much like the famous Galapagos tortoises and seemed almost as big. About then mosquitoes started harrying us and I insisted that we move on; Mauritius has malaria.

All day long we kept running into religious processions; it was the festival of "Cavadee" for the Tamil Hindu coolies. Who Cavadee was, or what; what he did, or it signified—these I never found out and my interest in trying to discern the sense behind it was considerably cooled by the fact that the central figure in each procession was a "holy man" with skewers stuck through his cheeks, in one side and out the other. To find nonsense posing in the name of religion it is not necessary to go outside my home town, but most of it seems harmless at worst. Mutilation seems to me another matter. I have no patience with any so-called religion that practices it, and would not bother to study its claims save through morbid curiosity.

We crass Westerners are often urged to study the exquisite spiritual beauties of Hindu religion and philosophy and I will readily admit that some of their religious poetry reads pretty well. But I contend that the disgusting behavior of many of their alleged "holy men" relieves us of any intellectual obligation to take the stuff seriously. No amount of sanctimonious rationalization can make such behavior anything but pathological.

These parades wound around through the streets and into the open country, where the Tamils gathered under trees and piled flowers in front of holy pictures. Their prayers, speeches, and hymns were strange to us but the air was more that of a Sunday School picnic than of Sunday School itself—little children scurried around underfoot, only slightly restrained by their solemn, sari-clad mothers. I noticed caste marks on foreheads and asked our driver what each meant. But he was Mohammedan and not only did not know but was contemptuous of such things.

Our driver took us to a pleasant hotel high up in the hills where we got an excellent lunch . . . only to find out after lunch that the hotel had refused him even back room or back door service because he was not "European." It was infuriating but there was nothing we could do. We urged him to stop at once somewhere where he could eat, but he shrugged and said that he would wait.

But his son, grandson, or nephew will probably someday own the hotel. The sahib's sun is setting in those parts.

We drove around the rim of the extinct crater, an awesome sight of textbook perfection—then dropped back down into Port Louis. The ship sailed late that afternoon. It had been worth a day but Mauritius is not a place I want to see again.

We crossed the equator without ceremony and turned into the Straits of Malacca, dropping back down toward Singapore. After days without raising a ship we were suddenly in heavy traffic and amidst numerous small islands, as well as having Sumatra on our starboard hand. I was surprised at the large numbers of lights visible on the Sumatran coast at night and had it impressed on me in a fashion that the *World Almanac* figures do not: these islands are very densely populated. We think of them as jungle and they are—but all of them are much more heavily populated than the States . . . New Jersey, not Wyoming, is the reasonable comparison. I think perhaps the strongest impression that we brought back from the Far East was the tremendous problem of population pressure. This is going to give us headaches, big ones, long after the communists are forgotten—and I have no idea what to do about it. It may be that there is no solution other than the ancient, tragic checks of famine, pestilence, and war.

It is all very well to answer glibly with "birth control." Actually it is no answer but simply a piece of verbal magic, like, "The Lord will provide." But the Lord *won't* provide and birth control *won't* work on this wholesale scale, for obvious reasons of education and economics and for much deeper reasons of human psychology and body chemistry which we do not fully understand. I once saw a sucker ad for a method of exterminating cockroaches; the device was two blocks of wood: place the cockroach between them and squeeze.

Birth control is about that effective—excellent on a retail scale; worthless at the wholesale level.

But don't blame any religious opposition to birth control. In the long run, religious opposition to or humanistic support for birth control are both as irrelevant and as ineffectual as prayers for rain; the numbers on this planet keep increasing just the same—fifty-five thousand more people at today's breakfast table than there were yesterday morning, twenty million more this year than last year, in each decade an increase greater than *the entire population of the United States.*

Occasionally one sees stories which "solve" this problem by emigration to other planets. I wish it would work but it won't. Oh, we will colonize the other planets someday; that is as certain as tomorrow's sunrise. But it will have no effect at all on the problem of population pressure on our own beautiful and tragic globe. To stay even, not gain an inch, we would have to persuade or coerce nearly sixty thousand people to take to the sky every day of every year. Bypass the psychological problem, assume that it is solved—by force, if you like. The physical problem remains: we can build spaceships but we can't build that many. There isn't enough steel, aluminum, uranium, or anything else on this whole planet to permit us to build enough space ferries to move the daily increment and keep on doing it, day after day, year after year.

The real problem of the Far East is not that so many of them are communists, but simply that there are so many of them.

The above is somewhat out of its proper order, for we have not yet seen Singapore, where I first learned the meaning of the word "teeming"—nor Djakarta, especially Djakarta. We arrived in Singapore early in the morning, my own first impression of it being a shout from Ticky: "Hey! Look!"

Passing by our porthole only a few feet away was the ribbed sail of a Chinese junk. It brought the Far East into my lap. While I knew that those funny sails and odd ships were as contemporary as atomic piles, subconsciously I had had them classed with pigtails and the old Dowager Empress as something out of an earlier era. So we hurried into clothes and topside to watch the junks.

Arrival in port was accompanied by the usual hoorah, some of it necessary, some of it questionable. As usual, Captain's Dinner and arrival in port almost overlapped, with about three hours sleep only between. As usual the port doctor wanted to see us while we were at breakfast, the immigration officer required our presence while we were packing, and the steward's bill contained a major error which had to be corrected. There was the staff to tip, chief steward, head steward, table stewards, room steward (we were sad at leaving the incomparable Kwai Yau), lounge deck boys, night man, *etc.* Mail, messages, cables, addresses to be exchanged—it was past ten o'clock before we were checked in at the Raffles Hotel.

There was a cubic foot of mail waiting for us there, much of it business mail, and I sat down to sort through it to determine what was important while Ticky settled us in. In about five minutes I looked up and said peevishly, "Have you unpacked?"

"No."

"Then don't. I'm going to see if they can move us to a quiet room." The room we were in, actually a bedroom, pitting room, and bath suite, was excellent, but it was on the ground floor and right at the corner of the building and ten feet outside was a traffic light. Every time the light changed the traffic would pour in one window and out the other. Traffic in Singapore is thick, enthusiastic, and noisy. Singapore is just above the equator and the climate is a steady hot and humid, like being soaked in warm oatmeal. Little men with sledges were playing *Hammer Ring* inside my head and I was beginning to realize that I should have gone to bed early after the Captain's Dinner even though I had wanted to say good-by and drink a cup of kindness yet with everyone in the ship. My morale is never improved by the irritations of quitting a ship, moving baggage, and getting through customs, and it had not been helped by an incident at the gate. When the customs officer had asked us if we had had anything to declare, Ticky had looked him in the eye and said, "Two pounds of heroin."

His eyes bugged out, then he decided to treat it as a joke, laughed hollowly, said, "Yes yes, no doubt," and refrained from searching us. But I did not draw a breath until we were outside and in a taxi.

Then I took a deep breath to load me for what I had to say. "Look, you redheaded juvenile delinquent, don't you know you can get us into trouble with pranks like that?"

"Nonsense! I didn't have any heroin."

"Sure, sure—and you got away with it. But suppose he had been one of that large number who despise Americans? He could have decided to teach you a lesson in respect for Her Majesty's officers, you know."

Ticky said something rude and irrelevant about Her Majesty's officers. Having little respect for vested authority at home she seems to believe instinctively that the very notion of authority abroad is presumptuous and probably unconstitutional; the spirit of the Boston Tea Party is always just below the surface.

But it was not a joke to me. I was seriously worried that she might grow restive at the wrong moment and get herself or both of us into trouble that the American consul would be hard put to straighten out. She was behaving like the fictional heroine who insists on doing something foolish and dangerous which then gives the hero a chance to be heroic. But I was no hero; I was just a middle-aged man in glasses who had no influence in foreign ports and no Lone Ranger tricks up his sleeve.

"Look, baby," I answered wearily, "we've been all over this before. Don't you realize that he had the authority and the right to keep us there for three or four more hours while he subjected us and our baggage to a probe search? How would you like to be stripped to the skin?"

"I'd like to see anybody try it!" She leaned forward and got herself unstuck from the cushions of the taxi. "Though this would certainly be the weather for it."

All in all, my nerves twanged like a harp by the time we reached the hotel; the traffic noises and the damp heat of our room were simply the insupportable last straws. I sought out the manager, an imperturbable East Indian, and told him my troubles.

He showed me several rooms, all of which were for one reason or another no better than the one we were in. Then he somewhat reluctantly showed me one which suited. I took it and hurried back.

"Any luck?" Ticky asked.

"Yes. Grab your purse; we're going out on the town. They'll move our baggage while we are gone."

"But what about our new room? Can't I look at it?"

"Never mind now. It's upstairs and clear across the hotel, a couple of blocks away. It's okay, you'll see it when you get back. Come on now, let's see the town."

She came somewhat reluctantly but soon forgot about the change in room once we were in a taxi and on our way. Singapore, one of the "Seven Sinful Ports," is probably the most fascinating city we saw all the way around the world ... even though we did not see much of the seamy underside which forms the basis for romantic fiction. No opium dens, no beautiful Eurasians held captive in international brothels, no sinister agents of Dr. Fu Manchu, or (much more probably) of Chou En Lai. All three of the above, plus a knife in the ribs in some dark alley, are (I feel sure) available in Singapore, but they do not come to the attention of middle-class couples traveling in each other's company and staying out of dark places.

Even without them Singapore is a three-ring circus and a year-long Mardi Gras. It has a million people packed into a short stretch of waterfront suitable for fifty thousand at the most. It is a Chinese city, despite the Union Jack overhead and the fact that it is more than a thousand miles from China proper; there are only twelve thousand Europeans, mostly civil servants and traders; four out of five are Chinese and the fifth is an Asiatic of some other sort.

Properly speaking, the whole city is a slum, so tightly stacked are they one on another. But it is so alive, so cheerful, so bursting with energy that the slumlike quality of it is not depressing. There are admitted slums near the waterfront, hovels built of trash and lived in by people who have neither pot nor window, and there are many, many narrow back alleys that are slums as the term is used in Chicago or New York. But even the "good" streets are so jampacked as to be slums to anyone used to mountain and prairie—or even in comparison with the endless apartment houses of our big cities. The first thing Ticky said, when we turned off the quay boulevards into the city itself, was, "Oh, look! They've got all their flags out. I wonder what they are celebrating?"

A second look showed that they were not flags; the swarming mercantile street we were on was arched over by housewives' laundry, threaded on bamboo poles which stuck out and up from almost every window. Most of the clothes were brightly colored and the effect was very gay, but the effect was accidental and went on every day.

Singapore is the place for shopping. You can buy anything; they will sell you your own hat if you lay it down on the counter. The city is loaded with bargains, most of them real, and waiting to be dickered over—treasures of the Far East, manufactured goods of the West, and careful copies of the latter from Japan and elsewhere. Some few spoilsport innovators have introduced fixed prices but they may be ignored; most buying and selling is still a joyous game, each trying without malice to outwit the other.

It affected Ticky the way fresh catnip affects a cat. Dickering in South America she had never really gotten used to; their shops are too much like ours and South American politeness is so overwhelming that it seemed rude to suggest that the price was too high. But in the bawling, brawling atmosphere of Singapore bazaars and stalls she was able to swing into the spirit of it and enjoy it—so much so that I began to wonder what would happen when we got home. The butcher would say to her, "That will be three dollars and eighty-seven cents, please"—and Ticky would look at him scornfully and say, "Don't be silly! I'll give you a dollar and a quarter. Wrap it up."

I made a mental note to be present when it happened; I wanted to see the butcher's expression.

The prices, even the fixed prices, really were preposterously low. In general a Straits dollar would buy about as much as a U.S. dollar back home—but our dollar would buy three Straits dollars. Ticky bought a little handmade silver bracelet charm, a Chinese junk complete to rigging of silver thread, for five cents American—and this was at a fixed-price store. Later on, one of similar quality purchased at the Royal Hawaiian Hotel in Honolulu set us back eight dollars.

The most colorful place to shop is Change Alley, a narrow passage ten feet wide and a block long but crowded with a hundred permanent shops, uncountable sidewalk merchants, and swarms of money changers. The money changers will swap any currency for any other currency, operating directly out of their pockets while people jostle their elbows on both sides, performing complicated arithmetic in their heads without any noticeable pause, and coming out with an answer that you had better check carefully, then count your money carefully.

Then count your fingers. And the fillings in your teeth.

The little holes in the wall forming each side of Change Alley will sell you anything from really valuable precious stones, or carved jade of high quality, to plastic Buddhas made in Jersey City. Between them, almost covering the already-crowded and too-narrow pavement, traders operating from card tables, push carts, or even old newspaper spread on the street to protect in part their handfuls of merchandise, will sell you anything from a full meal to a Chinese New Year's greeting or a ring with a peepshow built into it. The feeling is Coney Island combined with Woolworth's, all with a lusty flavor of its own. I wish I could go there every day.

A little shopping and a little sightseeing and it was time to go back to the hotel for lunch and a sight of our new room. We had selected the Raffles Hotel from Colorado Springs, because of its fame in history, legend, and fiction. It really is a fabulous old pile, a luxury hotel in every sense, ancient through it is, and a place where one expects an E. Phillips Oppenheim spy to be lurking behind every potted palm.

We picked up our key at the desk and I led Ticky across the "World-Famous Palm Court" (it says so right here on this postcard), up a flight of outdoor stairs, and onto the gallery which led to our room. I let her in and watched her.

She did not say much at first, but wandered around looking at things and touching them. The living room was twenty-five feet long, fifteen feet wide and about twelve feet high, furnished in ebony and trimmed in Chinese red lacquer, with several easy chairs, tables, lamps, a couch, and a buffet. There were two electric punkahs overhead. Beyond the living room was an enclosed porch with two day beds, a large and fancy bar, more easy chairs. Opening off it to the left was an open porch just as roomy which was furnished lavishly with smart garden furniture.

Ticky turned back to me with her eyes wide and her expression solemn. "Yes, darling, but where do we sleep?"

"In here," I answered, and opened double doors wide with a manner suitable to the janitor of a cathedral.

The bedroom was twenty-five feet long, big as the living room, and contained two kingsize Hollywood beds, chairs, two chaise longues, two enormous wardrobes, an oversize dressing table, and an executive desk. Two airconditioning units served it, one at each end. Beyond it was a tiled bath fifteen feet square.

There remained one door I had not opened when I had taken the "room." We found beyond it a service porch, not shared with anyone, which had clothes lines, wash tubs, and other useful, homely items.

Ticky came back into the bedroom, sighed deeply and said quietly, "But can we afford it? Heavens, can we even pay for it?"

"Brace yourself. This so-called 'room' costs just three dollars a day more than the 'minimum' room we were in. At that differential I didn't think we could afford *not* to enjoy oriental splendor once in our lives —we never will again."

Ticky gasped, sat down suddenly, and began to giggle.

"Do you remember," I went on, "what we paid for just one room about half the size of any one of these four at Sun Valley last year? That one room without meals cost just what this suite plus six meals a day costs here."

"Are you sure there isn't some mistake?"

"There is no mistake . . . but I never saw a sharper proof that our own economy does not match in with the rest of the world; we are getting this much too cheaply. But I haven't told you the rest of the joke. The manager was reluctant to show me this place. He asked twice when we would sail; I told him I did not know but Wednesday looked like a good bet. He shook his head solemnly and said that he had one more 'room' but it was reserved for Wednesday.

"So I suggested that he could move us a second time, if necessary, and he finally showed me this. But the last thing he said was, 'You understand now, if you take this room and stay past Wednesday, I'll have to move you. Mr. Rockefeller always has this room and he has reserved it and he will expect to have it this time.' "

As it turned out, Mr. Rockefeller stayed as a houseguest of the Queen's Commissioner and canceled his hotel reservation, so, although we did not sail on Wednesday, we did not have to move. We enormously enjoyed the use of "his room" and could well understand why he would ask for it specifically.

With the room came Foo. I think Foo was number-one boy for that floor, but he took care of the end suite himself. Kwai Yau had introduced us to the perfection that the Chinese can bring to domestic service; Foo continued this level of intelligent, anticipatory service but with some charming and individual quirks of his own. He was about four feet ten and could not have weighed a hundred pounds in his uniform. At a wild guess I would place his age at sixty, give or take ten years. His usual expression was one of self-contained rage, which gave way at rare intervals to a shy and surprisingly sweet smile.

Foo stood for no nonsense from his guests. They were going to be served properly whether they liked it or not. The conventional term for this is "keeping face," and so it is, but I prefer to state it more explicitly; Foo had a steel-hard personal integrity which made him require of himself nothing less than perfection in everything that he did no matter what anyone else thought of it.

We shared with him a modicum of language, not quite English, not quite Pidgin, which did well enough for domestic matters. Ticky's first chore was to sort out clothes requiring laundering and drycleaning—practically every stitch we owned since we had had no chance for drycleaning since leaving Buenos Aires and had not been able to send laundry the last few days before arrival in Singapore. She was pleased to see that twenty-four-hour service was available for a 50% extra charge, pointed it out on the ticket to Foo, and explained to him most carefully that we wanted everything back the next day.

"Too much money," Foo answered.

Ticky explained that she knew it cost more but that we needed the clothes.

"When you sail?"

Ticky admitted that our ship did not sail until the middle of the week following but told him again that she wanted the hurry-up service anyway. Foo shut up and staggered out with most of the contents of ten suitcases. I had saved out one suit and a nylon shirt and some shorts; Ticky had the dress she had come ashore in and one dinner dress.

The next day a couple of shirts and some underwear came back, nothing else. To Ticky's inquiry Foo answered, "Tuesday!"

"But I wanted them today!" Foo shrugged and would not answer.

We made do with what we had. My one suit was beginning to smell like a bear rug; it was well to be upwind of me. On Tuesday all the rest came back. Foo brought them in, hung up the suits, stowed the laundry, and presented Ticky with the chit, stabbing his finger at it and saying with fierce triumph, *"See?* I save twelve dollars!" (Straits dollars).

We thanked him sincerely and did not laugh until he had left. Then we gratefully put on clean clothes.

We had been there two days when Foo braced me on the subject of shoes. I have never gotten used to the cosmopolitan custom of putting one's shoes outside at night to be polished. In the *Ruys* Kwai Yau had noted this and had taken care of it his own way by selecting a pair each night and putting them out himself; he never mentioned it. Foo's approach was different. He stepped up to me, looked up, glared, and said angrily, "Tonight—you put shoes outside bedroom door! Never mind corridor, just bedroom door. I come in, get!" He grew almost purple and jabbed his finger at my feet. "Your shoes are *too dirty!"*

I put my shoes outside the bedroom door.

Some days later Ticky and I were entertaining in our "room" before dinner. We had become used to having Foo pop up whenever needed and to his being never more than a buzzer signal away. This time for the first time, when I pushed the service button, a strange Chinese appeared. I asked, "Where's Foo?" but could not understand the answer; this staff member had very little English and I had no Cantonese at all. So I said, "Never mind," and ordered drinks—with no difficulty, as such international words as "gin sling" and "martini" we shared.

The drinks arrived in a few minutes. About ten minutes thereafter Foo showed up, in uniform. We managed to get it straight that I had simply wanted bar service, that it had been provided and I wanted nothing else. Foo left.

The next day I remembered to ask him about it. After a certain amount of semantic difficulty I got it clear: The strange bellman, while weak in English, had nevertheless understood that I had inquired for Foo—so a message had been sent out into town, Foo had dressed again in his uniform, left the bosom of his family, and had come at once to find out what I wanted, even though he was not on duty. I tried to apologize; he shrugged and closed the subject.

We did not tip him at all until we left. The amount had been the matter of much thought and had been arrived at by starting with a formula which one of the international oil companies advised their employees stopping in Singapore hotels to use; to this we had added a percentage to allow for the fact that Americans are expected to tip higher than others, plus a percentage for superlative service, plus the amount he had saved us on drycleaning. It added up to a generous tip by Singapore standards but a stingy one (in comparable circumstances) in the United States.

Foo seemed quite pleased with it. But he left rather hastily and returned with the corridor boy who did the heavy cleaning. Foo pointed at him. "He good boy, too!"

I had no formula to help me in this, so I gravely presented the other man with a tip which I hoped was appropriate in view of their relative ranks. Foo seemed to approve—he did not glare at me.

Pleasant as our suite-cum-Foo was, we spent little time in it. A few peanuts fed to a dog in Montevideo began to pay off in most surprising dividends. Senor Maurice Nayberg had given us cards of introduction to business correspondents of the Nayberg firm in various ports; we looked up one of them here, Mr. Ho Choy Moo.

From the moment we met Mr. Ho until the day we sailed we were taken in charge, driven around town, taken to dinner, helped with our shopping, taken sightseeing, taken on a long drive north into the Sultanate of Johore, taken to amusement parks, even taken to church. And when we left, Mr. Ho supplied us with letters of introduction to smooth our way through Indonesia.

It still is not clear to me just why hospitality was so heavily lavished on us. We had made it clear at the outset that our acquaintance with the Naybergs was of the slightest, covering only a few hours of our short stay in Montevideo. Mr. Ho had himself never met the Naybergs and knew them only by business correspondence. It seems to me that protocol would have been more than satisfied had Mr. Ho taken us to lunch and advised what to see and where to shop—not that we had even that coming to us but to show courtesy to the Naybergs.

Whatever the reasons were (and I can't believe it was just our sweet dispositions even though we usually get along all right with children and dogs)—whatever the reasons, we were given a free ride through Singapore which could not have been purchased from a travel agency at any cost. The Hos even included John Lloyd in much of it, simply because he was with us much of the time—John was enjoying an indefinitely long vacation in Singapore at his employer's expense because his permanent-residence visa for Manila had not yet come through.

We were treated to superlative Cantonese food, food which made us realize that even the best Chinese restaurants in the States do not bother to supply the real thing to unappreciative and ignorant heathen. Bird's-nest soup and shark fin were the only items I could identify but I must state emphatically that chop suey had no part in it. Mr. Ho insisted that Ticky must use chopsticks and instructed her in the art to the point that she learned to pick pieces of cracked ice out of a bowl with smooth plastic sticks. Try it sometime when you are feeling lucky; the coefficient of friction between ice and smooth urea plastic is zero followed by a string of noughts. The trick is to use the sticks as gently as possible, almost no pressure; occidentals tend to use them like a pair of pliers.

Often the whole family escorted us, Mr. and Mrs. Ho and four children—Ho Chee Pen, Ho Chee Fei, the one daughter Ho Mei Ling (after Madame Chiang), and the baby Ho Chee Cheong. Boys carry a generation name, in this case "Chee," as well as a family-name and a given name. Mrs. Ho was an exquisitely beautiful little girl who had kept her figure and her sweet disposition through four children. The children were all well behaved but so shy that we did not get well acquainted with them.

Mr. Ho dressed much as I dressed and the kids were dressed like the kids back home but Mrs. Ho usually wore a chang sam, which is the formal, stylized Chinese dress with the high collar, skirt slit at each side, and quite tight. It must be tight—Mrs. Ho, modest herself as a nun, once went home to change because she decided that the chang sam she was wearing was too loose.

Ticky had to have a chang sam and Mrs. Ho advised her where to go. Singapore is a place where they will take your measurements in the morning and deliver a tailormade suit to your hotel in time to wear it to dinner the same day. Ticky's measurements were not taken until around noon but the dress was delivered about five o'clock. I concede that tailoring a chang sam is not the job a man's suit is, but try to get that service in New York. The dress was midnight blue heavy silk with a dragon of sequins coiled across the chest—price, $10 U.S.

It appeared to have been sprayed on with a paint gun, rather than tailored and it met with Mrs. Ho's approval. The peekaboo effect of the side slits is rather startling. Shorts show a lot more skin but shorts do not dress up the landscape the way a chang sam does.

The Hos took us to one of the "Worlds"—there are three, the Great World, the Happy World, and the New World, and they are the Singapore versions of Coney Island, so much like our own amusement parks that there is no need to mention anything but the differences, the first being theaters for classic Chinese drama and the second being Joget dancing. The Chinese theater was the sort which can be seen in New York and San Francisco in the States—days-long performances, extremely ornate costumes and hairdos, stagehands that sit and smoke and have lunch right on the stage, very stylized acting and a singsong delivery not like ordinary Chinese speech. Since we did not understand the dialog and did not know the traditional plots it was interesting only as an oddity to us. But I was impressed by one thing: I had been told that all the female parts were taken by men. This may be so; I found it almost beyond belief. Those cunning little "girls" with their high voices were much more convincing than any female impersonators I have ever seen before.

Joget dancing is the sort of social dancing the Mohammedan Malays do—mostly extremely sexy rumbas and foxtrots. The "Worlds" have several dance halls with taxi dancers available, all just as one finds it in America save for one point: their religion frowns on bodily contact, even with the finger tips, so the taxi dancers follow their partners without the help of any physical lead; they "shadow dance." They are very skilled at it and never fumble in even the fastest and most complicated steps. It appears to be a skill developed by years of practice; we noticed several apprentices, nine or ten years old, who hardly ever gained partners but would join some couple and duplicate every motion of the older girl. The kids seemed only slightly less skilled at it than were the grown women.

While the religious injunction forbade touching, it did not seem to forbid anything else. The couples danced only an inch or two apart and the undulant gyrations they went through would cause them to be thrown off the floor anywhere else. A hula dancer would have blushed.

The long drive the Hos took us on into the Sultanate of Johore was remarkable on one point only—a sight of royalty. Singapore is an island like Manhattan, larger than Manhattan but much smaller than Long Island; it is connected with the mainland, which at this point is Johore, by a causeway, one which the Japanese armies found very convenient when Singapore was caught with its guns facing the wrong way.

We passed through customs for once with just a wave of the hand. Singapore is a free port while Johore is not, but the guards at the border did not seem worried about smuggling.

The countryside, the manners, and the people seemed no different from Singapore save that we were now out in the country and passed through only an occasional village; the buildings were substantial in structure and Western in appearance—no grass shacks, no mud huts.

We glanced at the palace grounds from the outside, then went on to the zoo. It was like any other fairly large zoo except for one thing: it was not, strictly speaking, a public zoo although it was open to the public. It was the private property of the Prince Regent ("Regent" because the old Sultan is ill) and existed only because he likes animals and wanted a zoo. While we were poking around among his caged tigers and apes and so forth, we ran across him. Mr. Ho pointed him out.

It is my contention that the least he could have done, with due respect to the romantic notions of citizens of democracies who gain their notions of royalty from books, would have been to show up riding an elephant and wearing a turban. But he was leaning against a borrowed Jaguar sports car and wearing a beaten-felt hat, a sweat-stained khaki shirt, and wrinkled khaki trousers. We knew the car was borrowed because, as Mr. Ho pointed out, the license plate was that of a private citizen.

If this sort of thing keeps up, I shall have to give away my copy of *The Little Lame Prince.*

But the most amazing place the Hos took us to was the Tiger Balm Garden, also known as Haw Par Villa. There is another one like it, named the same and built by the same man, in Hong Kong; otherwise I am reasonably sure that there is nothing else in the world even remotely resembling it.

Several people aboard ship had said to us, "Be sure not to miss Tiger Balm Garden."

"All right," I had answered. "What is it?"

"Well, uh . . ." Our advisor would pause, look helpless, and add lamely, "Never mind. Just be sure you don't miss it."

I am going to have the same trouble now. I will try to describe it but I probably won't manage to put over its essence. Just be sure that when you go to Singapore *you* do not miss it. It is free, it is not advertised, and nobody cares whether you go or not. It is unlikely that a guide or a taxi driver will suggest it, as there is nothing in it for them. But *don't* miss it.

Tiger Balm Garden is a good many acres of ground thickly covered by statues of rather poor quality.

And the *Venus de Milo* is a badly damaged statue of an overweight female with a busted nose.

You see? A factual description of a work of art is misleading; it does not convey the *Gee-Whiz!* element which is the difference—perhaps the only difference—between success and failure in art.

The statues in Tiger Balm Garden are of plaster and are painted in bright, garish colors. The modeling varies from adequate to poor. The statues do not sit alone on pedestals, but are in groups each of which tells a story; the background scene of each group is sculptured in full detail, furniture, landscape, or whatever is needed. Most of the statues are life size and the effect is to find yourself catapulted right inside a comic book. A sex-horror-crime-sadism comic book it usually is, too, for the emphasis is on the two eternal elements of drama, love and death. Most of the stories depicted are Chinese fairy tales, and pretty rugged fare for tots those stories must be—although classic fairy tales of any culture, including our own, run to themes that could give the comic books cards and spades any day and still excel in blood and violence.

But the themes and moods shift rapidly. Just beyond a long and very bloodthirsty tableau of a war between heaven and hell you find yourself suddenly faced by Donald Duck, seven feet tall and grinning down at you. No excuse is necessary for his presence here; Chinese children know Donald as well as their own fairy tales. A bit farther on is a modern tiled swimming pool, deep end, shallow end, diving board and ladders; it is inhabited by a half dozen mermaids, giant plaster fish and enormous crabs. Why? Well, don't you think a few mermaids would improve any swimming pool?

There is a long underground tunnel which is purgatory in gruesome, explicit detail. Chinese notions about these matters are less poetical than those of Dante, fully as imaginative, and much more drastic. The punishment for a woman guilty of adultery struck me as unnecessarily extreme, and the reward of usury was so horrible that I resolved never to touch the banking & loan business just in case there was something to it.

Ticky refused to look at this stretch. She complained that it made her ill.

But most of the groups and sequences did not show torture, but depicted simple, hearty violence and sex—for example wicked witches who disguised themselves as beauteous, bare-skinned maidens in order to lure wayfaring monks into their caves to rob them. The monks cooperated heartily and everybody had a good time right up to the last scene, where the monks were dispatched quickly and without sadistic furbelows.

What is art? Our own artists have been dinning at us all this century that art need not have draftsmanship, subtle use of color, nor any of the classic disciplines. Certainly these statues would make Praxiteles spin in his grave, but there is a mounting effect of awe, amazement, wonder, and sheer delight. If the scrawls and blobs of our own modernists are art at all, then these lusty creations must be great art.

The Tiger Balm Villas in Singapore and in Hong Kong were built by Aw Boon Haw, multimillionaire publisher, banker, industrialist, and vendor of patent medicines. His Tiger Balm remedies, the most popular of which is Tiger Balm itself, are used throughout the East. I am told that they are quite useful. In any case they made him fantastically wealthy, much of which wealth he gave away. The Tiger

Balm Gardens alone, which deserve to be classed with his charities, would have cost millions of dollars to build here and must have cost in excess of a million even in the Far East, yet there is not even a box in which to drop a voluntary contribution.

I heard two stories as to why he did it: one that he believed that as long as he was creating something he would not die, the other that he could teach basic morals through these frozen morality plays to that part of the population too poor and too ignorant to have had the opportunity to gain moral wisdom from textbook and schoolmaster.

I doubt if either story is true; I suspect that he did it because he wanted to.

United Press reports that he died in Hortolulu 4 September 1954. May his unique spirit rest in peace.

As we were leaving Haw Par Villa with the Hos, something came up which made it appropriate and necessary for Ticky and myself to mention what church we belonged to. We had avoided the subject of religion up to then because we did not know whether the Ho family was Buddhist, Confucianist, Christian, or what. The precaution was not uncalled for, as an educated Chinese who also speaks English is not necessarily a product of missionary schools, nor certain to be a convert even though educated by Christian missionaries. On another occasion Mr. Ho had learned that I had studied oriental religions and some mention was made of Confucius—I may have quoted one of his extremely quotable proverbs, or perhaps he did. Two nights later Mr. Ho introduced me to another Chinese gentleman who got me aside and said solemnly, "I understand that you are a student of the Scholar."

I made an intellectual standing broad jump of fifteen thousand miles, recalled that I was somewhere east of Suez and "the Scholar" was not Aristotle, in these parts, but Confucius—so I nodded solemnly and admitted that I had that honor, in a small way.

From then on he treated me not as a tolerated white barbarian, but as an educated gentleman like himself, an equal. My actual knowledge of the great sage is microscopic, but my point is that I would never have been accepted as an equal had I given the impression that I believed that all wisdom and virtue was a monopoly of the Christian faith.

But the situation did come up whereby it was necessary and polite for Ticky and myself to admit that we had been reared in the Methodist Church—whereupon Mr. and Mrs. Ho said with delight, "Why, we're Methodists, too!"

Almost at once we found ourselves attending services in the Straits Chinese Methodist Church.

I found myself projected both in time and space, not merely back to the American middle west but back thirty years as well. This was no boulevard church with a microphone at the pulpit; this was a piece of my childhood. The ladies in the choir wore chang sams, all else was the same, even to the notice board with its movable figures which set forth the attendance last Sunday versus the attendance this Sunday, even to the announcement that the Ladies' Aid was giving a box supper next Thursday evening. I think perhaps it was the nicest thing the Hos did for us.

We visited other churches, among them several Buddhist temples and one Mohammedan mosque. I was not favorably impressed by the Buddhist temples, either by their alleged beauty nor by the attitude of the priests, who seemed to be indifferent to anything but the cash entrance fee. The mosque was much more attractive in its bare, austere beauty than were the temples, which were tastelessly jammed with ornate, overdecorated junk.

We had to remove our shoes to enter the mosque, of course, and Ticky swears that that was when she picked up athlete's foot—which I consider unfair to Islam, as there were daily opportunities to contract it in hotels or aboard ship, especially aboard ship. Ticky just resents that she was told that she must take off her shoes, or stay out.

Earl (the student of yoga) and Marianne, his wife, were also at the Raffles and were tracking down Hindu fakirs among the Tamil colony . . . but this was one religion we did not choose to look up; we had had enough fakirs for a lifetime in one day in Mauritius. There was one adept in town who did a very odd stunt: he would cut off the tongue of one of his followers without letting it bleed—then (so it was seriously claimed) stick it back in place and heal it. I don't know and I did not trot along after Earl and Marianne to find out. But it seems to me you would soon use up a lot of followers that way.

Instead, we went to the botanical gardens the morning that show was supposed to take place, a choice less educational, for me if not for Ticky, since my knowledge of botany is limited to digging dandelions, but a good deal more fun and easier on the stomach.

It was fun because of the monkeys. We purchased a supply of peanuts and bananas from junior merchants near the entrance; as long as the supply lasted we had little time for plants. Wild monkeys swarm in the gardens and they expect tourists to feed them. They gathered around Ticky like a kindergarten class, accepted bananas from here, peeled them carefully, and ate them daintily. Ticky sat on the grass and stowed the peanuts in her lap in order to have both hands free to make fair distribution and maintain discipline, as the monkeys, like children, tried to shove and crowd and each get a lion's share.

While she was thus busy, one more enterprising monk sneaked behind her, made a long arm, and snatched her entire supply of peanuts out of her lap. He headed for a tree top while Ticky shouted, "Hey! come back here."

When she was forced to realize that he was not going to come back, then or later, she turned to me with her eyes round with astonishment. "Did you see that? Why, he's *dishonest."*

In two more years they will have to let those monks vote.

The day was on us when we would have to leave Singapore, with its crowds and its pungent odors and its trishaws (the coolies no longer pull; they pedal instead) and its pint-sized taxis and its febrile, sleepless activity. We did not want to leave. While it symbolized all the ills of the East and the sins of colonialism, we found the city itself warm and friendly and wonderful, from the little goats that scampered loose on the streets and never quite got hit by the automobiles to the bazaarkeepers who would look you in the eye and try to cheat you, all with the warmest good will.

We wanted to entertain the Ho family at least once before we left; the obvious thing—almost the only thing we were equipped to do—was to invite them to dinner at the Raffles.

But a worry was niggling at the back of my mind. "Ticky, have you considered that we might have trouble? The Hos are not 'European' as the South Africans so squeamishly put it ... and this place is the last stand of the pukka sahib. We may run into 'Jim Crow' rules. I certainly would not want to subject them to embarrassment."

Ticky nodded. "I've thought of it," she replied crisply, "and I've thought of an answer. We'll serve drinks up here; they can't stop us from doing that. Then we will go down to dinner and if anyone makes the slightest fuss we'll come back here and have dinner served privately up here. Then after dinner you and I will check out of the hotel and as we leave we'll set fire to it."

It seemed a good plan. But it turned out to be unnecessary no one lifted an eyebrow at "non-Europeans" eating in the main dining room of the Raffles, although we had seen no others. The Far East is changing—Rudyard Kipling might have trouble recognizing the place.

X

The Underside of the Orient

THIS CHAPTER IS not for the squeamish.

On second thought, I will not be any more graphic than I have to be; if you get the notion that Indonesia is a good place to stay away from, that will be sufficient.

You may remember that we had not only been unable to book transportation from Singapore to Australia but also had not been able to get an Indonesian visa. The visa we did manage to get in Singapore through the intercession of a shipping agent who knew the ropes and was able, by personal favor, to get the consulate to bypass the processing of our papers through six different government departments. We made out endless forms again, naturally. Indonesia not only has the longest and most complicated forms in the silly business but also wants them made out in quadruplicate-original. But we did get the visas.

We found out that our experience was not unique but customary, for we ran into a couple in Singapore from California who had tried to get Indonesian visas from the consulate in San Francisco, only to be forced to sail without them. They tried again in Singapore, as we did, and found their own papers in Singapore, on file with the consul there —whereupon they were required to pay ten dollars apiece to have their old papers canceled before they were allowed to start over and reapply. There is something wildly comical about such super red tape; it excites admiration rather than fury.

I had wanted to go to Bali, but our visa was good only for Djakarta. I did not go to the foot of the line and start over, not merely because I was worn out with red tape at that point but also because I had learned something much more disheartening. For the tourist and photographer Bali has long had two outstanding points of interest, endlessly reduplicated. But the revolutionary government, in its wisdom, has decided that the folk ways of Bali were destructive to the dignity of the new nation; a law was issued requiring sarongs in Bali to start just under the armpits, as they do elsewhere in the islands, instead of considerably lower down as has always been the Balinese practice. Now Bali is just like the other islands of Indonesia.

"Come to Beautiful Bali" indeed! I'll take Minsky's.

And besides that, we couldn't get to Bali anyway. Shipping was awfully tight and we took the only ship we could get, one which stopped only at Djakarta, then went down the east coast of Australia to Brisbane and Sydney. We wanted to land on the west coast of Australia, cross the continent by train, and leave from the east coast. But we had no choice; the only cabin we could get from Singapore to Australia was the one we took, and we got the last cabin in that ship. There was a sister ship going to Fremantle at the same time, but it was chock-a-block, not a berth to be had for love or cumshaw.

The ship we managed to get would have been uncomfortable at best, for she was an old tub which had been designed for Chinese coastal service, overnight trips with two to three thousand Chinese stacked almost like firewood. Now with the Reds running China and that trade gone perhaps forever she had been sketchily refitted as a cargo liner, but the result was far from comfortable. Our stateroom was a third the size of the one we had in the *Ruys* and there were, of course, no private baths. The toilet and bath facilities for men were adequate if not appealing but Ticky found that she shared one facility, bath and toilet combined, with all the other female first-class passengers in the ship; in the course of a three-week voyage this produced more than one acute and embarrassing emergency.

But the worst thing about the ship was that it was filthy dirty. The ship had no purser; the chief steward, an Indonesian, doubled in brass and carried out neither the duties of a purser nor the duties of a chief steward properly. In consequence his Chinese staff, with whom he could communicate only through his Chinese assistant, ran the ship to suit themselves. Now it is an unpleasant fact that lower-class Chinese have no notion at all of Western concepts of sanitation; this is not a racist remark, it is simply a fact. Inasmuch as the stewards in this ship received no instruction in these matters and were subjected to little or no discipline, they did as they pleased—and what they pleased was often disgusting.

For example (and I will keep the examples down to a minimum), discarded towels were laundered only if visibly dirtied; otherwise the room stewards would let them dry, refold them and serve them as "clean" linen. The same practice was followed with napkins. The menus were fancy jobs of four-color printing but the cooking was poor and the food and the dishes were dirty—I once found a cockroach baked into a dinner roll. I won't describe the food-handling methods nor the condition of the galley, but they were nauseating.

The ship's doctor could have and should have made sure that the ship was run in a sanitary fashion, but he himself was a loafer who did not care. Some ship's doctors are excellent but there is a percentage who are the drones of medicine, who sign up for the easy life and are too lazy even to carry out the scanty duties of a ship's doctor. Unluckily ours was this sort. The ship's rules required him to be in his office at nine in the morning and five in the evening; he seemed to feel that he had no other obligations. I recall one morning when a passenger hurt his knee rather badly at deck sports. The ship's doctor was sitting a few feet away, watching and sipping a drink; the passenger went up to him and showed him his damaged and bloody knee. The doctor glanced at it and remarked coolly, "I shall be at your disposal at five o'clock"—and turned away.

While we were not well off in first class, the passengers in second class and in third were in squalor. Second and third class in the *Ruys* were modest indeed, but they were spotless and smelled clean. In this ship they were filthy, reeking holes with a stench better left undescribed. The major shortcoming about ship travel is that, if you do have the bad luck to get a bad ship, you are stuck with it as thoroughly as if you had received a jail sentence. For three endless weeks we could have quit this ship only at Djakarta—which we would have done had Djakarta been an improvement, which it is not.

Of course the Captain should have tightened up his ship by cracking down on the doctor, the chief steward, and his first officer. But, while there is never any real excuse for a Captain since he can never be relieved of responsibility for everything that takes place in his ship, nevertheless I felt a sneaking sympathy for the poor man in this case; he was so busy handling his ship that he hardly had time to worry about the internal administration. The passage from Singapore to Brisbane is no soft snap.

We first became aware of this the first day out, at boat drill. Abandon-Ship drill is never perfunctory in a well-run ship but in this case I was surprised at the extreme and careful thoroughness with which it was conducted. It had a wartime flavor to it; one might have thought that the ship's officers expected the ship to go down at any moment.

We decided later that such was very nearly what they did think; those waters are still infested with mine fields left over from the War and never swept. I once got a look at one of the charts we were using; penciled into it in many of the passages between islands were mine fields.

This voyage would not have been the sinecure which cruising the open ocean is in any case; we were hardly ever out of sight of land, the charts are only moderately reliable (some of the surveys are much more than a century old), and shore lights are not too well tended. The second half of the voyage, through the Great Barrier Reef of Australia, is comparable to driving a narrow and twisting mountain road; reefs and shoals abound, the channel is narrow and must be piloted with great caution—we passed the wrecks of ships whose masters had not been cautious, or lucky, as may be.

The ship had neither radar nor gyro compass to make the shiphandler's task easier, nor did the master have any pilot but himself for the dangerous passages. It meant that he was on duty almost continuously a great deal of the time, night and day—his skill and years of experience against very real dangers. I know that he gave unsparingly of himself to keep his ship safe, so I don't quite have the heart to blame him personally for the faults in the ship's housekeeping. He kept us safe.

But just the same, it was a filthy tub.

Every ship that leaves Djakarta takes its quota of Dutch refugees who are leaving "Holland in the East" for good. The Dutch have been there for three and a half centuries; many of them have known no other home for generations. Those who still remain run the risk of surprise arrest and imprisonment, even of assassination—while we were there, in a town we visited, an entire family of Dutch dairy farmers was murdered by terrorists.

One of the refugees gave me a genteel tongue-lashing aboard ship, the theme being that the United States had forced Holland to surrender the Dutch East Indies to "communists," and that we would someday be sorry for our folly.

But Indonesia is a very complicated place; whatever the truth may be, it is certainly not that simple. It is true that we played a role, through the United Nations, in helping the Indonesians to gain their freedom. We were not alone in it, nor could the United Nations have forced the outcome on the Dutch had the Dutch been physically able to maintain their rule there after the defeat of Japan. Out of the maze of facts and allegations, one thing is sure: the Indonesians were fed up with the Dutch and wanted their freedom—and the Dutch were not able again to subjugate them.

But that, too, is oversimplification. Here are two facts which illuminate but do not tell all. After three hundred and fifty years of Dutch rule 92% of the natives could not read or write—nor did Batavia, the capital city, have anything resembling modern sanitation. These facts prove little but they do cast doubt on the validity of the longstanding reputation the Dutch have enjoyed for being the world's ideal colonials. To my simple mind a lack of schools and sewers after centuries of rule spells exploitation of the natives—not benign paternalism.

But one may ask how the Dutch could reasonably be expected to take education and sanitary engineering into remote jungle villages? That is not the situation at all. Java is an island a bit smaller than North Carolina and the Dutch built fine roads into every corner of it, to take out its incredible wealth. As for "villages," Djakarta, formerly "Batavia" and capital of Holland-in-the-East, is a city as large as Chicago. Imagine, if you can, Chicago without running water and sewers—or go to Java and see what the result is, though I do not recommend this course.

One of the results is an infant mortality estimated at 75% in the first year.

But I am oversimplifying again and Indonesia is not simple; a lifetime of study would not be ample in which to dig out the facts about it and put them in their true relationships. Despite the notion (and, in some part, the fact) that it is a "small" country, "unimportant" and certainly one we hear little about, it has half as many people in it as the United States, some eighty million. Java, which is effectively three-quarters of the nation in population and wealth, has a population density of more than a thousand to the square mile, versus about fifty for the United States. No country in Europe is so crowded, not even Holland itself.

This new nation is broken up into five major islands and countless smaller ones. There are twenty-five major languages and two hundred and fifty dialects. It has undergone centuries of colonial rule, four years of Japanese occupation, four years of revolutionary war thereafter, and civil war was going on in Sumatra while we were there . . . even in the "quiet" areas the bushes still held terrorists. They are undergoing drastic inflation, most of them can't read or write, and they have no experience in the difficult art of self-government. They are in a vulnerable position both to communist invasion from the north and to communist infiltration at home. Wish them luck; they are going to need it.

The harbor at Djakarta is a good one, well equipped by the Dutch with docks and facilities. As our ship stood in, the marks of war were plain to see; I counted seventeen sunken hulks as we approached our berth. We were told that Surabaja, the former Dutch naval base farther east, displayed even more wreckage of war.

Our time was limited and we were anxious to go ashore, but even after our visas were checked (Indonesia requires a visa to permit even a through passenger from a transient ship to step ashore, which most countries do not)—after our papers were checked, it was necessary to buy Indonesian money from the chief steward and then arrange transportation.

It is against the law to take any foreign money or traveler's cheques into Indonesia. The chief steward sold us rupiahs at 11.4 to the U.S. dollar, and it is much more than possible that he made a good thing out of it, as the black market rate was about 25 to one. I think it may be assumed that the chief steward of a ship calling regularly, himself a citizen of the country, would have means, if he chose, to get dollars ashore and change them back into rupiahs without going through official channels. I have no slightest evidence that he so operated, but the opportunity was there. The Chinese crew members used a simple and straightforward way of beating the currency laws; they were not permitted to go ashore, but they sailed currency ashore to confederates in paper darts. No doubt such transactions were well planned in advance; all sailors throughout history have been parttime smugglers. The stewards in the *Ruys* made most of their income from smuggling between the Far East and South America, with Japanese pearls figuring largely in the undercover trade.

At the customs gate I was subjected to the only body search I encountered in any country. I was not required to strip but my person and my pockets were most carefully frisked. I took it with beaming good nature—we had been warned in Singapore not to argue with a policeman or a soldier in Indonesia no matter what happened, as they would show no hesitation, if angered, in shooting you down on the spot. I don't know if this is true as I never put it to a test; I cooperated and was never treated with anything but smiling courtesy. Indonesians are more than friendly under peaceful circumstances, but news items confirmed the rumors that they could be quite dangerous if crossed. I was happy not to find out.

The customs officials looked like soldiers, which is not the case in the other countries we were in. Soldiers were very much in evidence elsewhere in the country, too, helmeted and always armed. If there were policemen who were not soldiers, I did not see them; the country simply seemed to be under martial law.

Women were not subjected to search at the customs barrier, none of any sort, not even their handbags. They were simply waved on through while the men were detained. The logic of this escapes me. But in consequence of this Ticky was decidedly miffed with me that I had not let her bring dollars ashore. The logic of this escapes me, too, since I had no way of guessing the circumstances in advance. Once through the barrier we stood in the rain for nearly an hour while trying to arrange for any sort of transportation. The docks are far from the city and there was neither bus nor taxi. At last, through phone calls put in for us by a Eurasian clerk who spoke English, two cars showed up and three carloads of tourists piled in; we headed for town.

Singapore is a city, a true metropolis, of slightly less than a million; Djakarta is a village of more than three million—it lacks almost every attribute of a city save people. It has just one modern hotel, Hotel des Indes, and even it is not modern compared with the Raffles, or even by comparison with the little Hotel Paragon in the remote town of Nelspruit. I do not remember seeing any building as tall as three stories and not many that were two stories high. Some of the downtown buildings are Western in type, of masonry, stucco, or sheet metal, but the overwhelming majority of buildings are typical Javanese homes of poles, woven matting, and thatched roofs crowded in together almost wall to wall. We had been told that here, if a family of swallows moved into a house, the family of humans moved out, because then other swallows would follow and the nests would be of much greater value than the house—as an article of commerce to be sold to the Chinese for bird's-nest soup.

This was hard to believe until we saw the houses.

I am not sneering at the houses; they suit the climate; the temperature in Djakarta averages 79 degrees the year round and never varies from that by more than a few degrees. The constant high humidity makes it seem much hotter, however; grass-and-bamboo shacks are not inappropriate.

The most unforgettable feature of Djakarta (and the one I would like most to forget) is the canal which runs for miles through the city and is paralleled by the main highway into the mountains. This canal has no perceptible current and contains opaque yellowish soup; it is used for every conceivable purpose—every purpose, it is sewer, bath, laundry, and well. Every fifty yards or so there was a stone staircase leading down into the water and at each there would be people using the canal for all of the above purposes. I don't want to be too graphic about this, but in Java most bodily functions are performed in public.

Our guide pointed out the swarms of people bathing in the canal and said proudly that people here were very clean; they were likely to come down to the canal for a bath three and four times a day. I could understand how it could be an endless process, since bathing in that filth would leave a person dirtier than ever. The so-called bath was rendered still less efficient for females by the fact that they bathed with their sarongs on, whereas the men just stripped naked and went in—though I don't suppose it really mattered either way; filth is filth.

People stooped to drink, housewives dipped up pans from it to take home for cooking, and at one point we saw a woman dipping a toothbrush in the canal to scrub her teeth—an unexpected refinement. Just upstream from her the canal was currently being put to use in its aspect as a sewer; the guide glanced at both activities and said happily, "People never get any disease from the canal. The sunlight, beating down all day, kills the germs."

It was a comforting thought even though without scientific basis. The people here are Moslems and I think I see in the guide's remark a modern version of the very old Mohammedan belief that water in a stream will purify itself in a few feet.

Djakarta is not pretty but it is colorful. Traffic is dense everywhere, some automobiles, many trishaws, many two-wheeled carts drawn by tiny, dispirited little horses much too small for the loads, countless swarms of people on foot Coolies trot along with poles over their shoulders, carrying loads heavier than they are—sometimes the load is a portable restaurant with charcoal stove smoking and the bearer himself the chef. The sarongs of the women and the jackets usually worn on top of them are in the garish, bright, and somehow beautiful color combinations and patterns made famous by Gauguin. Twelve-year-old mothers not much more than four feet tall stagger along, made lopsided by a child riding one hip. Gums made bright red by betel-nut chewing startle one from time to time and there are depressing sights of leprosy, twisted limbs, and numerous blind beggars—a spate of humanity overpowering as an avalanche and one which produces the same feeling of helplessness.

Ticky and I located a friend of a friend at Hotel des Indes, an American motion picture producer brought out by the revolutionary government under contract to build up a motion picture industry in Indonesia. I could not help but feel that Java needed a movie industry the way great-grandmother needs a pogo stick, but the new government is determined to make Indonesia self-sufficient in everything—"Export everything, import nothing" is the implied slogan of resurgent nationalism right around the world. In any case the wisdom of it was no responsibility of the American in charge; his firm had sent him out to do a job the Indonesians wanted done and he was doing it. I have no doubt he did it well, as he was Mr. Lothar Wolff who produced the world-famous *Martin Luther*.

Mr. and Mrs. Wolff seemed to be glad to see people from home, drove us around town, and took us out to a very pleasant seaside country club for a drink—a club which had been built for the Dutch masters but which was now used by the upper crust irrespective of skin or race. Perhaps I should have used the opportunity to have pumped him about the "real" Indonesia; instead we talked about an imminent eruption of the super-volcano Krakatoa, located in the Sunda Strait a hundred miles away. In 1883 Krakatoa produced a disturbance which makes H-bombs look like toys: 3600 people were killed, the noise was heard 3000 miles away, the air wave traveled three times around the globe.

Now the giant was rumbling again and Mr. Wolff was about to leave to take pictures of the explosion. He was as pleased as a child with a new balloon; the possibility of becoming a statistic did not seem to fret him.

We stayed aboard ship that evening not only because Djakarta is not safe after dark but also because there is literally no place to go. But there was amusement aboard ship, for it was Chinese New Year's. We noticed first that the ship suddenly became without service after dinner, no one to answer a ring, no bar boy to sell cigarettes or drinks; they had all gone aft and below, where they were whooping it up with noise and gin and firecrackers and feasting. We moved back to the fantail to watch.

Fireworks are fireworks, and, while the stern of the ship was kept spectacularly illuminated for hours, there is no need to describe it. After all, some of our own best fireworks originated in China; these were the same sort we use on the Fourth. But we met back there a Scot just discharged from the Gordon Highlanders and who had been serving for several years in jungle warfare in the Malay. This is an area which has for some time been officially free of communists, terrorists, liberation forces, and other freewheeling soldier-bandits.

But according to our shipmate the "police activities" that continued still added up to daily slash-and-run warfare; the casualties were still high even though news stories no longer appeared.

His report seems strengthened by the fact that mere possession of any firearm on the part of a native in the Malay States carries with it the death penalty—contrast this with our own custom wherein such possession is not only not a crime but a constitutionally guaranteed right.

Some of this we had to get through an interpreter, a young Australian who was present. The Scotsman had spent the first fourteen years of his life in a highland village, the next ten in a highland regiment, and his accent had never been corrupted . . . and Ticky and I had never before heard pure Highland Scottish. At first we were unable to follow it.

He was a handsome, well-mannered young man with the social and political attitudes of a barracuda. To him, all who were not white were "slanties" and deserved killing on sight. The only trade he knew was war; he was on his way to Australia where he expected to join the Australian army—he had been ten years a private but expected to do better in the Australian army. During the voyage he got into a certain amount of trouble, as he was traveling third class but demanded the privileges of first class, because of his white skin. The Indonesian chief steward could, of course, do nothing with him; the young Scotsman ignored his pleas to stay in his own part of the ship. Finally the Captain told him that he would put him in irons if he again showed up in the first-class lounge. After that he was a little more careful, but not much.

We arranged the following day to go to Bogor, a town in the mountains in the middle of Java which is noted for botanical gardens started by the Dutch a couple of centuries ago. We went through customs as before; I was searched but Ticky was not. As soon as we were clear of the barrier she said, "Fine! Now let's locate that black market."

"Huh?"

"I brought my traveler's cheques. Let's cash a few. I want to do some shopping today."

"I thought I told you—"

"I know what you told me, but I don't intend to be cheated out of sixty per cent of the value of my money. Ridiculous! The whole thing is a swindle."

I shut up. My objections were purely pragmatic anyway; my opinions matched hers. I have no moral scruples about dealing in a black money market. (Rationed foods and such in wartime are an entirely different matter.) Wherever there is an attempt to control currency there will be found a black market in money, as the control laws are not merely an attempt by the government to get something for nothing at the expense of its own citizens and their customers, they are also an attempt to defy natural law, to lift by the bootstraps. Fiat cannot determine the value of a country's money; only free exchange can do that.

I admit that fiscal theory is much more complicated than my sweeping generalizations, but the last sentence above expresses an easily observed fact to which there are no exceptions in history. But I do not mind going along with the gag and treating the process as a form of concealed taxation if the controls are moderate, as they are in general in the Commonwealth. But where the scheme approaches confiscation, as it did in Indonesia, my reluctance to deal in a free market is based only on a fear of getting caught.

But Ticky is never afraid of getting caught. When the time comes, she will no doubt tell Saint Peter that his bookkeeping is all wet and that she intends to make some drastic changes in the way the joint is run.

On the previous day some of the passengers had managed to sneak contraband money ashore; our driver had, without hesitation, told them where to find a black exchange. Ticky had listened to this and had asked him, "But will they deal with you when they don't know who you are?"

The driver let go the wheel and made an imploring gesture with both hands so oriental in its histrionic emotionalism that I was forced to suppress a laugh. "Madame—they will *beseech* you!"

"Oh." Ticky threw me a dirty look and shut up. On that day we had nothing with us but a few highpriced, official-rate rupiahs and she wanted to buy some sarongs.

So on the next day we drove to the black market. "I didn't tell you," Ticky said happily, "because I knew you would get cold feet."

"You won't like the jails here. Insects . . . cockroaches. Centipedes and tarantulas and scorpions. Things crawling over you and fluttering in your face in the dark—and I won't be there to protect you."

She looked uncertain, for I had flicked her on her one weak spot. Java has. an exceptionally intense density of population of the true dominant races of this globe; in that hot and humid climate insects abound in a fashion almost unbelievable to inhabitants of colder, drier places, and Ticky cannot stand creepy-crawlies of any sort. They change her from an Amazon to a frightened little girl. She can't abide anything with six legs—except trios, and not all of those.

I have explained to her that most insects do not bite, sting, nor carry disease, and that even bees, wasps, and hornets are polite to people who are polite to them and do not startle them. But she remains unconvinced; insects panic her. Except butterflies, of course, which she does not class as insects at all, but as self-propelled flowers.

I could see that the remote possibility of spending even a few minutes in a calaboose that was sure to be heavily infested with her mortal enemies was worrying her. "Fleas . . ." I added. "Lice—"

But she shrugged and squared her shoulders. "You're just trying to frighten me. I won't have any trouble."

Nor did she. And they did beseech her. When our car stopped in the little side street where the money changers hang out we were immediately surrounded by a crowd, each member of which swore by Allah that he gave the highest rates.

Ticky opened her purse and got out her book of traveler's cheques. "How many rupiahs for twenty U.S. dollars?" she said briskly.

They all stopped cold. One of them said hesitantly, "No cheques, please, Madame. Cash dollars."

"These are the same as cash dollars. They were purchased for U.S. dollars in the United States of America. Didn't you ever see traveler's cheques before?"

"Certainly, Madame, we know all about traveler's cheques . . . which is why we don't want them. They are very hard to handle. But for your dollars, please, I give you very good rate."

"But I don't have any dollars. Not a single one."

"Madame is sure?"

I thought she would take offense at the implication—which the would have back home. But she took it for the purely professional gambit that it was and answered, "Quite sure. We changed our last cash dollar in Singapore. Now does anyone, anyone at all, want to buy American traveler's cheques, good for their face value in American dollars? Speak up, or I'm leaving."

Nobody answered. On the face of the spokesman was a mixture of doubt, cupidity, and very real apprehension. He withdrew a few yards from us and the rest followed; they went into a huddle. Although the money changers were all in competition he seemed to hold some sort of leadership by prestige. The committee meeting went on for some time, then he came back to us. "Very well, Madame, as a favor to you. Will you come this way, please?" His gestures indicated that he wanted us to come inside a restaurant, out of the public eye.

Ticky held back. "What's your rate?"

"Eighteen rupiahs to the dollar."

"What! That's ridiculous. They are paying at least twenty-five rupiahs for a dollar anywhere."

"For your dollars, Madame, I will pay twenty-six rupiahs. But these are cheques."

"They are the same as dollars."

"To you perhaps, Madame, but not to me. I must pay again to get them changed. Even twenty-seven rupiahs for dollars."

"I really don't have any cash dollars. None. But I'll save these cheques and spend them in Australia before I'll let them go for any silly price like that. What is the best you will pay?"

"Aaaeeh . . . nineteen, Madame. I make no profit."

Ticky looked stubborn and so did he, they managed to look alike. I was getting fretful at the delay and a bit nervous; I interrupted with, "See here, give us twenty and get it over with."

He did not answer but produced a fountain pen and started counting out rupiahs. We left almost at once with my pockets all bulging with rupiahs—dirty, sweat-stained, ragged, and worn, and (I was afraid) possibly counterfeit. Our driver was not outside, nor the car; I looked up and down the street, then saw him waving to us at the intersection. He had moved the car around the corner to another street.

He waited while we walked toward him. Just as we reached the corner an open touring car filled with soldiers, each with a Tommy gun and wearing U.S. helmets, swung around the corner and cruised slowly down the street. They glanced at us, but said nothing. I looked back. The street was empty except for a dog and one child; the swarm of money changers were nowhere in sight. "Get in the car," the driver said. "Let's go."

When we were a few blocks away our driver-guide asked, "What rate did he give you?"

I told him and added, "Was that a fair rate?"

"It's all right. He cheated you only a little—traveler's cheques are no good; they can be followed. How much did you change?"

I hesitated, then decided that if he was asking because he intended to collect a commission later, there was no reason for me to make it difficult, so I told him. He dropped the subject and asked, "You want to go to bazaars now?"

"Yes," said Ticky.

"No," I said firmly. "Let's try to get to Bogor before lunch." It being a Moslem country he did as the male said. Ticky did not debate the matter, as she was almost as eager to see botanical gardens as she was to shop. She seemed quite happy; if the close encounter with the soldier-police had been noticed by her, it had not dampened her. Presently I noticed that she was whistling a tune; I identified it as "Working for the Yahnkee Dollar."

I said morosely, "You know what you are, don't you? A dollar imperialist . . . a jackal of Wall Street. Probably a warmonger as well."

She gave me a sunny smile. "I'm going to buy the *prettiest* things!"

The drive from Djakarta to Bogor is shown as out in the country by the map, but the houses stand almost solidly along the roadside the whole way, with more houses glimpsed behind the others as you speed past. Once in a while there would be a break and the rubber plantations or the rice paddies would come right up to the road. This is a place with climate but almost no seasons; the rice is cultivated through the year, crop after crop. Java is normally a rice-exporting country, and is becoming so again, now that the dislocations of war have been somewhat smoothed out. We could see water buffaloes, the tractor of the East, patiently pulling plows through the water-covered mud, followed by a driver himself knee deep in it. I asked our guide what the wage rates were for farmhands?

I had a little trouble making myself understood, although he spoke excellent, almost-accentless English. I explained again, then added, "Or do they all own the land they work?"

"Oh, no." He considered it, then added, "But they don't get *paid* anything; they get a place to live in and their food. That's all they expect."

I shut up and mulled over the implications of this. Java is one of the richest places in the world, possibly the very richest for its size, both in agriculture and in mineral resources. Yet it is so crowded that the ratio of people to arable land is four to the acre, whereas U.N. estimates of the proper ratio for a decent diet is four to *ten* acres. These figures are clouded by the fact that an acre in Java produces much more than does an acre of good farm land most other places. Indeed, if it were not so, Java could never have reached its present crowded condition; starvation would have prevented.

But things are badly out of whack and I wondered if it were possible for the island to feed its inhabitants no matter how efficiently its riches were managed. We passed the studio and sound stages of the Indonesia national motion picture industry about this time and I wondered again if the country could afford such luxuries? The installation looked comparable to those along Melrose Avenue in Hollywood and must have cost quite a lot of foreign exchange—then I wondered if it were not utterly necessary in the long run to build up the motion picture industry and things like it and thereby swap labor at home (which they had in plenty) for food grown abroad.

All I could really be sure of was that I did not envy President Sukarno his job.

To add to the already innumerable troubles of his possibly insuperable problems the feminists of Indonesia are now after his scalp—and all the poor man did was to take a second mate of the four permitted him by the Koran.

We sped on toward Bogor over excellent paved roads, dodging barrows and buses and foot traffic and dragons. The dragons were in honor of New Year's and each one was animated by six to a dozen Chinese school kids. Thy dragons could not see very well, decked out as they were, and anyhow they were very busy rearing up and snake dancing and being fierce, as proper dragon manners require. Fortunately our driver had good reflexes. We got to Bogor with only some near misses.

The charge for admission to the botanical gardens was only half a rupiah, or about two cents American. They are verb old and very grand. The scientific names of the plants and trees we saw may be found on p. 975 of volume 12 of the 1954 edition of the Encyclopaedia Britannica; I am not going to cheat by copying them down here. But the gardens have representatives in lavish numbers of all the plants to be found in the tropical rain forests ("jungles" to us Tarzan fans) of the Sunda Archipelago, the most impressive of which are the tall, graceful trees, one hundred and fifty feet or more in height, which reach up to the sky and form the roof of the jungle. As for the rest, there was everything from magnolias to mangoes spilling over hill and canyon and all beautifully kept up.

A barefoot laborer with good command of English (which he asserted that he had acquired simply by talking with tourists) spotted us and took us in charge; Ticky had her usual half-Latin, half-English shop talk while I swatted at mosquitoes and appreciated the deep shade—the sun outside the gardens had a Mad-Dogs-and-Englishmen intensity. Finally I insisted that we leave, as Ticky had not taken her anti-malaria pills. The laborer graciously permitted us to make him a small gift and we parted on a high level of international amity.

We were forced to eat lunch in Bogor or go hungry. I say "forced" because the best restaurant available was far from appetizing. Bogor is a pretty little town compared with Djakarta; it is green and nestles into the mountains. But its standards of sanitation are reminiscent of Djakarta's canal. We ate hot, cooked food and drank no water and hoped for the best. It was a Chinese restaurant and the food tasted good, but the dishes and place itself were dirty. We sat on an open porch at street level; traffic moved past six inches from my elbow, an arrangement which resulted in us being braced by beggars as we ate. Our guide recommended that we ignore them or there would simply be more of them hanging around . . . which was true but I do not have the courage to eat in the presence of a skinny, blind man who is being led around by an equally skinny little girl—and do nothing about it. While I know it is bailing the ocean with a spoon and changes the situation not at all, nevertheless when his filmed eyes stare past your plate and his nostrils quiver the only possible course is to pay and pray Allah to forgive you for being yourself and not the beggar.

So we paid and paid again, usually to blind men, and got out of there as quickly as we could, then crossed the square to the market. Bogor is far enough from the sea coast that the bazaars are intended for the local trade rather than for tourists. I don't suppose that we paid native prices, but even the asking prices were about half the best we could do at the bazaars around the Hotel des Indes back at the port. Over my objections, Ticky bought a coolie hat the size and shape of a large umbrella, the sort worn by the farmers in the rice paddies. It was a beautiful lob of basket weaving but about as manageable as a mattress. Then she turned to sarongs and scarfs and blouses.

She looked them over while the Javanese women looked her over and I looked them over. They stared at her silently, quite a crowd of them. Their faces showed nothing, but I wondered what they thought of her, with her white skin and her red hair and her purse full of rupiahs—and her height. Ticky is not big; she has a twentytwo-inch waist and I tower over her, but she was a foot taller than most of these women. Even the Javanese men seem small and smooth and childlike to us; they are not the big-boned hairy apes that we of the colder regions are. Very possibly our appearance alone is enough to make them think how pleasant it would be if we were dead; we offend just by existing.

But they simply stared, while Ticky bought enough batik to start a small tent & awning company. I got her back into the car as quickly as possible, as we were already short of packing space. The coolie hat would not, of course, pack at all and it was already a nuisance in the car. On the trip back we continued to encounter dragons, but they were getting a little tired by now and did not dance quite as much. Perhaps they were beginning to realize that the New Year hardly ever lives up to its promise.

When we got back to the ship we found that we had missed a chance to reach the west coast of Australia and with it the chance to cross the Australian continent. The sister ship of our own, the ship for Fremantle which we had been unable to book in Singapore, had been lying in the berth just forward of us; it had sailed an hour before our return. There had been a cancellation for one double room at the last minute and its purser had come aboard to see if any of us wanted it—so a search had been made for us and the space had been held for us right up to sailing.

I swore feelingly for a bit, as I had wanted very badly to make the trip overland across Australia . . . and, besides, the other ship might even have been clean. But it was impossible to do anything about it; we had literally missed the boat.

Ticky displayed her plunder and our Indonesian chief steward taught her several ways to wrap a sarong. It seems that each island has its own style of wrapping—none of them the way Dorothy Lamour wraps one—and you can tell what island a woman is from by the way she ties her sarong. He also showed her how to judge quality by sniffing the cloth. The rule seemed to be that the worse the odor the better the batik, though I may have been wrong about this.

We had planned for the next day several visits intended to be both educational and instructive. I wanted to take advantage of Mr. Lothar Wolff's invitation to visit the movie studios, this being a subject I knew enough about to form some opinions, and I wanted to see a Chinese school which was run by a relative of Mr. Ho. I had been told in Singapore that the school had more than four hundred pupils, grammar and high, hut nevertheless met in the small home of the principal as the school buildings had been a casualty of the War. I had asked how this was possible and had been told that each pupil attended only one hour a day, just long enough to recite and be assigned homework for the next day. The Chinese thirst for knowledge in the face of difficulties I had met before; it seemed to me that such a school was well worth seeing. I planned too, to call on a newspaperman to whom Mr. Ho had given me a letter; working journalists can, if they wish, give the real low-down on a situation better than anyone.

The next morning there was a steady tropical drizzle that seemed likely to keep up all day. The ship's newspaper, posted on the bulletin board, reported the murders of an entire family of Dutch dairy farmers at Bogor; it appeared that we had passed in front of their house about two hours before it happened. Another news item reported the arrest of the Dutch personnel of one of the two major steamship companies; they were charged with sabotage, nature unspecified, and the government had moved in on the firm.

There had been one incident right inside the ship, one which had everyone nervous. One of our shipmates, a nurse from Sydney, was traveling alone, taking the round trip to Singapore as her vacation. She had a single cabin. She was awakened in the middle of the night to find one of the Indonesian soldier-police leaning over her bunk—the cabin doors locked but the locks were the old-fashioned sort which could be opened by almost any skeleton key.

She had been too frightened to scream. He said to her softly, "Oh? So you are alone?" then had gone back and locked the door from the inside. Most fortunately her cabin connected with the next one by a door which could be used to make the two rooms a suite; she jumped up and unbolted it and ran into the next cabin, where an Australian married couple were living—to her great good luck they had not bolted it from their side.

By the time she had made her alarm understood the soldier had disappeared. She had reported the matter to the Captain but there was nothing he could do about it other than to make a useless report of it ashore. A merchant ship tied to a dock is part of the soil of the country it is in, regardless of the flag it flies; the soldier-police-customs-guards were free to come and go in the ship as they pleased, and which they did, night and day. Could she identify the man?

No, she could not; he had simply been a helmeted face in the dark.

I read the depressing news bulletins and thought about the fright the nurse had received, then turned to the rail and stared out at the rain. Ticky came out of the dining saloon and joined me. "Delightful day!"

"Just ducky, for ducks. See here, are you anxious to do more shopping?"

"Not really. But I'd give a nice price for a small snow storm."

"So would I. And I've just remembered that I've seen a movie studio; I don't need to see another one."

"You certainly don't! If you never take another Hollywood job it will be soon enough for me."

"Maybe so, but I wish we were in Hollywood right this minute. To tell the truth, hon, I've had just about all I can stand of being polite to little brown men with Tommy guns. What do you say we stay aboard today?"

She looked relieved. "I was hoping you would say that. This place makes my flesh creep. But I wasn't going to let you go ashore alone; you would get into trouble without mama to look out for you."

I did not argue this amazing perversion of the facts; I simply said, "Swell! I'll skunk you at crib. Or maybe we can get up a game of liar dice."

I suppose that it was a foolish waste not to go ashore in a foreign port, having spent the money necessary to get there, but I did not regret it then or now. Nor do I intend to go back. When our ship stood out of the harbor early the next morning it made us happy.

The next two weeks through the Java Sea, the Flores Sea, the Timor Sea, the Arafura Sea, around the northeast corner of Australia through Tones Strait (transited by the indomitable blackguard Captain Bligh in the longboat of the *Bounty)* and then south through the Great Barrier Reef, were not comfortable but were not entirely unpleasant. The weather was so hot that we slept naked without even a sheet, but no exertion was required of us—we had steadfastly refused to sign up for the deck sports contests organized by the untiringly athletic Australians. The hardest work of the day was to shower just before dinner, then dress and get out on deck before clean clothes were soaked through with sweat. We had Mollie and Bert with us as table mates, the Australian couple who had been with us in the *Ruys,* and they were unfailingly good company at all times. Just to grouse with them about the filthy condition of the ship made the conditions more tolerable.

Most of the other passengers were Australian sheepmen and their families, extremely wealthy but not showing it in any fashion. Several of them owned sheep stations, or "selections," larger than the fabulous King Ranch in Texas; a typical Australian sheep station will have an airfield of its own for the convenience of family and friends—but Mum will nevertheless be doing all the cooking for family and hired hands; the great wealth that has come to them in recent years has not changed their way of daily living. We found them easy as an old shoe and we were offered unlimited station hospitality, which most regrettably we were unable to accept.

The ship did not have the facilities for amusement that the *Ruys* had; most of our time was spent sitting around talking or in non-athletic games like liar dice. Liar dice was a game introduced by Bert; it can be played by any number of people as long as they are dishonest. It requires a set of five poker dice and an ability to lie convincingly, the idea being to pass the poker hand (of dice) from player to player, each player being permitted to roll once to improve the hand but being required to pass the hand along at a higher poker combination each time. The hand is not shown, that is to say the dice are always kept concealed until some player refuses to accept the declared valuation and challenges. If he challenges correctly, the other player puts a chip in the pot; if the hand turns out to be as high or higher than the declared value, the challenger contributes a chip. It is a freeze-out game; the last player surviving takes all.

This game brings out the very worst in people.

The three best at it were Bert, whose honest brown eyes would have served well a confidence man, Ticky, who is ordinarily painfully honest but who turned out to have a deviousness in her that I had never suspected, and Brian Salt, a young Englishman who not only had the natural advantage of a full set of blond whiskers to conceal his expressions but also was possessed of a telekinetic ability to roll five of a kind whenever he really needed them. Or perhaps he had the rare manual skill to roll dice without the usual element of chance—you can never tell with liar dice; it is an immoral game.

I am happy to say that we played only for chips, or I would have arrived in Brisbane in a barrel.

The thousand miles and more inside the Great Barrier Reef passed placidly and monotonously through water with hardly a ripple. As we came out of the reef we edged into a cyclone which had been tearing up roads and bridges all through Queensland, destruction so extensive that many of our sheep-raising shipmates were unable to go home and chose to go on to Sydney to wait out the weather. I concluded that we had had a narrow squeak; the Barrier Reef is no place to encounter a storm and there are plenty of wrecks inside the Reef to prove it. The Reef itself is not spectacular from inside, being usually just a vague line of white on a horizon that seems a little too near, plus numerous rocks and coral islands. The coral formations are said to be marvelously beautiful close up and there are many resorts along the reef to permit people to enjoy the phenomena, but from the shipping channel little can be seen but a line of white on one hand and the coast of Queensland, lush and green, on the other.

XI

Wildlife and Red Tape

WHILE THE POPULATION density of Java is more than a thousand to a square mile, the density in Australia is only three to the square mile. All other comparisons between the two countries are subordinate to this one. In almost every possible aspect Australia, the Australian culture, and the Australian people are as different from that which we had just left as is conceivable, but each of the differences (other than skin color) is strongly related to the fact that the Australians are a handful of people inhabiting a vast and almost empty continent.

Australia's people are almost entirely English in ancestry, but the culture is not English. Americans are more easily at home there than are Englishmen. But it is not our culture, either; it is simply one that we fit into without much friction. It is aggressively democratic in a fashion quite un-English, much more so than our own far west. The Australian working stiff isn't taking no nonsense off cops, or platoon sergeants, or bosses, or nobody, and if you want to make something of it, he is happy to drop what he is doing and oblige, with bare hands, boots, broken beer bottles, or take your choice. On the other hand he is quite willing to be civil to anyone who is civil to him and does not pretend to be better than he is. The attitude and manners are only an extension to the logical extreme of a common American *mores;* any American with enough sense to pound sand should be able to stay out of trouble and get along in Australia. They think as we do, only more so.

We arrived in Brisbane early in the morning and were able to go ashore with a minimum of red tape, since we were not disembarking here. The port doctor looked at our wrists, the immigration authorities looked at our passports, and we went ashore. Brisbane is located up the river of the same name; ships are able to tie up right inside the city, although in this case our berth was a mile or more from the downtown area. When we came out the customs gates we found ourselves in a middle-class residential area of small homes each on its own lot.

The climate and vegetation were strongly reminiscent of Southern California, but there was an even stronger impression of utter and homely familiarity, combined at the same time with strangeness, which I could not at first figure out. Then, as a street car came winding noisily down the street, I suddenly got it: this place had precisely the flavor and appearance of the American middle west of thirty to forty years ago.

I was to have that feeling many times in Australia, a feeling as if I had slipped slightly in time, like the *Connecticut Yankee* but in a lesser time span. I felt it most intensely in that neighborhood of modest homes in Brisbane but it never quite left me. Much of Australia feels the way America used to feel about a generation ago.

I know this sounds patronizing but it is meant simply as careful reporting. Australia is anything but a backward country, but it is rich in food rather than in manufactures, as of today. It is hardly surprising that its trams and much of its physical equipment look as if left over from the Mauve Decade, since such is often literally the case; the imported stuff is expensive and hard to replace.

The immediate effect on me was to make me feel at home for the first time in many months, most especially so after the depressing strangeness of Java. I liked Australia and I wanted it to like me.

We hailed the street car and rode it downtown. Downtown Brisbane looked a bit more modern but not much. It was a pleasantly busy large city, not too dirty and not too bustling.

We walked its streets for a while, tried a few of its shops and bookstores, and enjoyed the sound of English being spoken. But one sign, frequently repeated, began to bother us; it read: "CASKET IS CLOSING!"

About the tenth time we spotted this Ticky turned to me and said quietly, "I think we've blundered into an undertaker's parlor, dear."

"I'm going to find out what it is all about." I turned into a newsstand, attempted to buy a copy of *Walkabout,* an Australian travel magazine, then asked the proprietor, "What is this 'Casket' business?"

"It's closing. If you are interested, you had better hurry."

"Yes, but what *is* it?"

"Why, it's closing, this afternoon. If you want to get in on it, you had better move fast."

"Why is it closing? Who is dead?"

This might have gone on indefinitely if he had not suddenly gathered the idea that I really did not know what "Casket" was. Rather pityingly he explained that it was a lottery. The Australians are gamblers; they will bet you that it does, or that it does not, on anything. Lotteries and horse races are among the favorite legal forms of gambling, but legal or illegal the Australian will gamble. Perhaps the favorite illegal form is "Two Up," a game as simple as matching pennies—in fact, it *is* matching pennies, except that sometimes thousands of pounds will change hands simply because a pair of coins show heads at the same time.

A friend of ours in Sydney told me later that the basic interests of Australian men were "—beer, the races, women, and work, in that order." Nothing that we saw in Australia caused me to doubt the accuracy of his statement.

The subordinate position of women in this hierarchy of interests caused a good deal of friction during the War between Australian men, such few of them as were home, and American troops. The Australian male does not believe in spoiling his women; an attitude of, "Shut up and get hoppin' before I bash you one," is not uncommon. The American G.I. showed up with more money and an attitude that undercut the position of the local swains; the G.I. spent money on taxis—worse yet, he helped the Australian lass in and out of same. He bought flowers for her, candy, dinners, and shows, and in general exposed her to the Cinderella pattern which is common courtship among us, but not in Australia. He behaved like the city-slicker villain in a melodrama and naturally he was hated for it (by the Australian men) just as such villains always are.

The emotional attitudes generated by this unfair competition have not entirely worn off.

We had only a few hours to spend in Brisbane, so we hired a taxi for sightseeing. Instead of asking for the usual sights I asked the driver if there was a place nearby where we could see koalas. There was, at Lone Pine Sanctuary just outside town, so we went there. This trip alone made the journey to Australia worth while; these little animated teddy bears are Australia's finest jewel. I still regret being forced to miss the trip across Australia, but, had our trip to the koala bear park been our only glimpse of Australia, I would have considered the money well spent.

Lone Pine Sanctuary is a small, private zoo located in a grove of eucalyptus trees—I did not spot the "Lone Pine" but it surely must have been lonely. They have there several dozen teddy bears and the place is small enough and informal enough that visitors are permitted to handle them. This does a koala no harm; he loves it. A koala will cuddle with anyone who wants to cuddle; left to themselves, they cuddle with each other. In the wild state—and there are many, many of them still wild in the eucalyptus forests on the east and south coasts

—koalas have no natural enemies and have never learned to be afraid. Consequently if you pick one up, he assumes that you are a friend, hugs you and snuggles up. The Marquis de Sade could hardly resist such a response.

Ticky had her picture taken holding Little Mo, who was just two, barely adult. The picture shows Little Mo clinging to Ticky and wearing a bemused, just-woke-up, good-baby expression characteristic of all koalas and shows Ticky with a wide grin of utter delight which is equally characteristic of humans on coming into first contact with these most endearing of beasties.

The picture taken, the keeper took Little Mo from Ticky's arms, set her on the ground and said, "All right, go home." Little Mo started ambling slowly for the open door of the large cage she shared with her brothers and sisters. She came to a concrete curbstone six inches high; instead of climbing it she sat down and started to nibble at it. The keeper said, "Cut that out!" spatted her bottom and boosted her over the curb. She ambled on back to her family.

The keeper said disgustedly to us, "That happens every day. She knows that curb isn't good to eat—but each time she tries, just in case."

Koalas are not long on brains, but they don't need to be; their only food is the foliage of the eucalyptus trees they live in. What they do have is innate genius for being pets. If their diet was not so restricted (they cannot live without certain varieties of eucalyptus leaves), they would be much in demand the world over.

As it is, they may not be shipped out of Australia; each is a ward of the government, whether wild or tame—I mean "caged or loose," as there is no such thing as a "wild" koala; it is a contradiction in terms. Some have been shipped out in the past, to zoos that made special arrangements for their food, but the results were not entirely satisfactory and the Australian government is reluctant to grant such favors.

Even inside Australia the government keeps a close eye on them. They may be owned, yes, if the owner is well equipped to care for them. But let us suppose that the Lone Pine Sanctuary in Queensland were to sell one to the Sydney Zoo in New South Wales. The Zoo would pay the Sanctuary as a private transaction—but the state government of New South Wales would also pay the state government of Queensland an indemnity fixed by law to compensate Queensland for the loss it suffers in having one of its koala citizens emigrate to a neighboring state.

This stringent policy concerning the teddy bears does not indicate that the. Australian government is exceptionally sentimental about animals. Bounties are paid for killing kangaroos, as a pair of kangaroos will eat as much grass as three merino sheep, and any means at all is used to kill rabbits, even biological warfare in the form of a virus disease—the offspring of a dozen rabbits introduced in 1788 grew to an estimated half a billion and almost bankrupted the country. But in the case of the koala, an animal utterly useless unless killed for its pelt, the Australian government recognized that the world would be a much poorer place in the warm intangible values if it were allowed to die. I, as a representative non-Australian, wish to thank them.

Although koalas are almost as scarce as unicorns in the rest of the world, it hardly seems necessary to describe them since they are so frequently pictured. Everybody knows that they look like toy teddy bears; indeed, the toy teddy bear is modeled after the koala, not after the carnivorous bear. I will mention only that which does not show up too well in pictures. Man is rightly proud of his opposable thumb; that and his brain set him apart from the other animals. The koala was shortchanged on brains, but he has *two* opposable thumbs on each hand. His clown face always has a gentle, muddled look, like a person with one too many glasses of sherry. His bare and oversize nose I had always assumed to be a sort of horny beak (I was misled by the platypus, I think); instead it is soft and rubbery and the little fellow will gladly rub noses with you like an Eskimo or a Maori; it seems to be a gesture of the overflowing affection they feel for everyone.

When unhappy they weep with a cry like that of a human baby, pawing at their eyes as if to wipe tears away. This happened once while we were at Lone Pine; it is unendurable, one must console the little fellow at once—by cuddling it, of course.

There were other Australian creatures at the Lone Pine Sanctuary; we managed to find time to give them a cursory glance despite Little Mo and her relatives. Here we learned for the first time that, with Australian parrots, Polly does not want a cracker, but "Cocky wants a cup of tea." We discovered, too, that besides Old Man Kangaroo and the wallaby there are many, many other varieties of kangaroos, including a tree-climbing one. This struck me as being as inappropriate as overshoes for fish, but you can never tell about Australian fauna; they all seem determined to be as exotic as possible. Consider the bower bird, that builds a hideaway for seduction purposes only, like a roué's flat, and presents his light of love with "jewels." Or the platypus, which can't make up its mind, if any, whether to be bird, beast, or fish. Or . . . never mind; they are *all* on the lunatic fringe of the animal kingdom.

We met an emu there. He stared at us with big blue eyes and said, "Glug!" from way down inside, like a molasses jug on a cold morning. I said, "Glug!" back at him and he said, "Glug! Glug!" Whereupon I gave up, we were getting nowhere.

Looking around the sanctuary that day was a smooth black man with a crop of fuzzy hair. He was barefoot and wearing a skirt, with a white shirt above. I got our taxi driver aside and asked him, "Is he one of the natives?"

The driver looked at him. "Yes, he's an abo *[aborigine]* all right. Must have brought him here on account of the Queen's visit." I accepted the explanation and looked him over with interest, trying not to be seen staring. Later that day, in a local paper, we saw a picture of the man—he was a Protestant missionary from the Fiji Islands, present in Brisbane as an honored guest speaker at a church conference. This illustrates a fact I had not realized; the Australian aborigine is so scarce that many of the people on the thickly populated east coast have never seen one. Most of them are in the Northern Territory, where they are either cowboys or are living in their native state. No one—literally *no one*—who has seen both a Fiji Islander and an Australian aborigine could mistake one for the other. Had I known, the bushy, kinky hair of the reverend gentleman would have told me the difference; the Australian aborigine has wavy hair quite unlike the dense, almost felted structure which tops a Fiji Islander.

We never did see an "abo." We probably would not have seen one even had we been able to cross the continent, as there are less than 50,000 of them left, almost all of whom live far from the centers of white population. There were estimated to be some 300,000 of them when the white settlers arrived; these two figures alone make it clear that the past history of the contact between the two races is not one of which the white race may be proud. On the other hand, we need not lie awake nights over it, since the entire record of the human race of all hues is one of bloody conflict; the end result has been that nine million people now live in peace and civilized comfort in an area formerly occupied by one-thirtieth that number of stone-age savages more primitive than any other people on this planet.

Indeed, so primitive were the aborigines that most Australians in the past (and many of them today) seemed to have believed that they were subhuman. There is no scientific basis for this belief even though their almost animal-like customs give it a superficial plausibility. The brain weight of this race falls within the normal spread in brain weight of the European racial groups and the accomplishments of individuals among them tend to show that their native condition is environmental rather than hereditary.

It is possible that their potential genius is as great as our own, since even Shakespeare or Einstein would find it difficult to leave any permanent mark on the world if born into a culture without writing, one in which the opportunities to display brain power were largely limited to throwing boomerangs at kangaroos. Contrariwise, lack of opportunity does not prove that opportunity is the only lack; there seems to me to be no reason to believe that this race as a whole lacked any racial opportunity possessed (let us say) by stone-age savages of the Mediterranean.

As may be, the present Australians are as race conscious as any people in the world. Their racism is much easier to swallow than that of the South Africans, since they have no wish to exploit other races. (The remaining aborigines are not exploited; their numbers are too few for them to be of any economic importance.) Present-day Australians have no wish to have a servant race; they will do their own hewing of wood and drawing of water and are not ashamed of menial labor even at the highest financial and social levels. But what they do want with apparent complete unanimity is to keep *all* other races out of Australia. Not just the coolies, but *all* of them, educated or not. So far as we could tell, the "White Australia" policy was the one political issue supported by everyone at all times.

They are almost as anxious to fill up their great empty country, in order to make it strong enough to resist any new colonization by other races. They prefer immigrants from the British Isles but will accept, and subsidize the immigration of, people from any of the white Western nations. They are afraid of the great hordes of humanity north of them, of which the crowds in Java are only a sample. Although never invaded, they remember a time when the government was prepared to surrender everything north of Brisbane and make a last-ditch, last-hope stand in the south. (American troops saved them from that and some of them are grateful, a rare thing in international relations!) They fear the communist menace even more than we do; an overall triumph of communism means to them that they will be swamped in a tidal wave of millions of Asiatics. Which, of course, they would be.

If the communist powers win this present struggle, the present Australian nation will cease to exist even as a puppet state; it will be replaced by an Asiatic nation occupying the same territory. Knowing this, they are not as vulnerable to the creeping neutralism which daily makes England less and less our ally; they know that, if it comes to all-out atomic war, their only chance of survival lies in the potential ability of the United States to stand the first shock, strike back, and possibly win. Nor will they sit by and wait for us to win it for them. Australians will fight.

We left Lone Pine Sanctuary and rode back downtown, where we dismissed the taxi at the corner of Queen and Edward Streets, an intersection equivalent to Broad and Chestnut in Philadelphia. Brisbane is a standard Western city, very proud of its new city hall. It is about the size of San Jose or Mobile, with somewhat similar subtropical climate. It was started as a penal colony a hundred and thirty years ago and relics of the early days are still on display. But no Australian cares to have the convict system mentioned, unless he brings up the subject first. They are still sensitive about it. But there is no real cause for them to be sensitive; the United States and Australia were colonized by the same sort of riffraff in the main. Australia had a higher percentage of convicts in its early days than we had, but the convict system in Australia was the direct result of the American Revolution; Britain had to find some other place to dump her petty criminals and politically obstreperous after that—the first shipment to Australia was in 1788. Today one may hear matrons of Atlanta, Georgia, boast of ancestors who arrived in Georgia in such-and-such a year in the eighteenth century—when a quick check will disclose that no one but convicts arrived that year. Perhaps in time Australians will acquire the same smug, undiscriminating pride in ancestors, just any old ancestors, which characterizes our South, Philadelphia, and Boston. But they don't have it now.

"Nice" people, the prosperous and respected, hardly ever emigrate; they like it where they are. Colonists are the unsuccessful, the ne'er-do-wells, the outcasts, the indentured, and, quite often, the criminals, where "criminal" means anything from a murderer to a hungry petty thief and includes people who are aggressively dissident in their political or religious opinions. The United States has done very well on such a mixture and so has Australia. It has enriched each country with a very useful anarchistic strain of impatience with officiousness and rebellion against injustice, and has left England and Europe poorer by the loss of those very convicts.

But Australians don't talk about their ancestors.

(I wish we did not. It is a subject always boring to the victim. Worse yet, it contains a veiled insult not easily answered, unless the listener cares to indulge in calculated rudeness.)

It was a hot day in Brisbane and poking around its streets was thirsty work; I started looking for an oasis. I did not find one easily; the street signs by which one spots a cocktail bar in the States were absent. Feeling that a longer wait might endanger our health, I stopped a man on the sidewalk and explained our predicament, adding rather unnecessarily that we were strangers in town.

He was all helpfulness, politeness, and gallantry, with gestures, expressions, and manners like those of W. C. Fields at his ripest. He was not typically Australian, if there is such a thing; he was himself, a unique individual. "Ah, sir! Madame! You are expecting to find a cocktail bar. But this is not Paris, this is not New York. You will not find such here."

I inquired rather blankly what one did about it.

"One goes to a hotel. Not into the bar—oh no! Into the lounge. You will find one just around this corner."

I answered that we had just come around that corner, actively searching, and had spotted no indications. He put up a hand. "Never mind. I will show you. Come."

I protested that we did not wish to take him out of his way.

"Not at all. A privilege. This way, dear lady."

"Uh, look . . . do you have time to spare to have one with us?"

He stopped short, hesitated, and seemed at a loss for an answer. Ticky, by instinct I think, guessed correctly the trouble. "I don't believe we introduced ourselves. I'm Mrs. Heinlein and this is my husband. We are visitors from one of the ships in the harbor."

He immediately relaxed, smiled warmly, and told us his name, Mr. Sheppard. There was no further reluctance about joining us for a drink. He consulted his watch, remarked that he should be back at his office, but added that it was a far, far better thing to spend a few sociable moments with kind people. We marched around the corner with an invisible brass band leading us.

In Australia liquor licenses are granted only to hotels. Each hotel has a bar, but it is strictly stag; if a woman were to walk in, it would create some sort of a major crisis. But near the bar is a lounge, where women are permitted to drink seated at tables, out of sight of the bar itself. These rules are empty formalisms but are strictly observed. Mr. Sheppard took us into such a lounge.

Although we had asked him to have a drink with us, he brushed aside my attempt to pay—we were visitors, guests. Ticky ordered her usual Scotch-and-water, Mr. Sheppard ordered beer, and I decided to try beer myself, for I had heard of Australian beer.

Australians cause beer to disappear faster than an elephant drinks water; I had to hurry to catch up and I again lost a check fumble. I was not really anxious for a third round but, for my country's honor, I had to pay for at least one round; this time by getting my money out in advance and insisting, I managed to pay. In the meantime Mr. Sheppard kept us endlessly entertained with anecdotes. He was a man who had been everywhere and seen everything, and he could talk about it endlessly, with charm and droll humor. Before World War II he had traveled for years on business in Europe; he had returned home and was now a glass wholesaler.

I don't remember his stories too well. Australian beer is good stuff; two bottles of it and you think you are Old Man Kangaroo. Three bottles and you are ready to tear up lamp posts by the roots and bash policemen. I had three bottles.

American beer is a nice cool drink on a hot day, but it does not deserve the name "beer." It is sickly aftermath of Prohibition. I had not been able to understand, before I visited Australia, why it was that Australians were reputed to drink almost nothing but beer. There are three reasons: their beer, imported whisky, and their domestic whisky. Imported whisky is much too dear for any but the wealthy to drink; their so-called domestic whisky is a poor grade of radiator antifreeze put up in bottles. But their beer is the authentic joy juice, the stuff that made the preacher dance. It helps to explain why the Aussie soldier fought as well as he did and why he was insolent to sergeants.

I never tried it again.

At long last we had to leave Mr. Sheppard. We bade each other good-by warmly and blurrily, and Mr. Sheppard assured us that he was going to use his good offices to get us a steamship booking from New Zealand to the States. I don't remember the ride back. I climbed the gangway with my ears roaring, ate heartily, and went at once to bed.

The inhabitants of Sydney are convinced that they have the most beautiful harbor in the world and the longest bridge. They are wrong on both counts; the Rio Harbor is much more beautiful and the Golden Gate bridge is longer both in free span and in total length. There are several other bridges bigger than the Sydney bridge, no matter how you measure—the Firth of Forth bridge in Scotland, for example, or the George Washington Bridge. Nor is it, in my opinion, an outstandingly handsome bridge, though I admit to a prejudice in favor of suspension bridges. If you want to know exactly what it looks like, take a look at the Hell Gate Bridge, a twin about two-thirds the size of the Sydney bridge.

Don't raise either of these points in a Sydney bar; it would not be safe. Deep in their hearts, they *know* they have the biggest bridge and the most beautiful harbor.

It is in fact a most beautiful harbor and an enormous, handsome, and most impressive bridge. The harbor is a drowned river mouth, most irregular in shape, with a multitude of coves, creeks, and bays. In consequence all of Sydney seems to look out over the magnificent harbor; many residential neighborhoods are right on the water. There are many beaches right in the city, with some of the best surf bathing in the world—possibly the best, if you like big, muscular rollers and don't mind risking sharks. The Sydneyites don't mind either one; they take their chances on sharks (people are killed by them each year) and they prefer the biggest waves. All Sydney swarms to the beach each weekend, to swim, hold surfing carnivals, or just spine-bashing in the sun and the sand.

We got off the ship fairly promptly in Sydney, but from there on nothing went quite right. Immigration formalities were not too lengthy, the port doctor looked at our wrists again (I never did find out why), and we got through customs without too much bother. Brian Salt, who had been right behind us in line, had to wait an extra hour because customs closed for lunch, but we just made it. Most of our fellow passengers got caught by the same ploy, but we were lucky.

This practice of closing customs for lunch, tea, and so forth is one that any country would do well to avoid at all major ports of entry. A visitor's first impression of a country is at customs. He is usually tired, nervous, hungry, at least subconsciously afraid, and often legitimately in a hurry. If he is forced to cool his heels for an hour or more, usually in a most dismal shed, often under a "no smoking" rule, frequently without a place to sit down, while a petty civil service employee goes to lunch, he is likely to wind up with an almost pathological dislike for that country that no later impression will quite replace.

There is no more reason why a customs gate should close for lunch than a gasoline filling station, a telephone exchange, or any other public service. I noticed with interest and pride that, when we finally returned to the United States, we went through customs without delay although we arrived there right in the middle of the lunch hour, 12:30 P.M. I strongly hope that all United States ports of entry operate the same way. It is no harder for a civil service organization to arrange relief rotation of lunch hours than it is for a private firm. Most countries spend large amounts of money trying to build up good will abroad; it is moronically stupid to squander the investment through such petty inefficiency. I do hope the United States customs office we encountered is typical of them all.

Getting through customs just under the wire seemed to use up the last of our luck. We had originally planned to stay in Australia almost a month, but our failure to obtain passage to the Australian west coast had disrupted our schedule and left us with only a scanty nine days before our booked departure for New Zealand. I still wanted time to go outback and see the interior of the country . . . possibly even accept one of the numerous invitations we had received to stay on a sheep station. To do this we needed to swap our booking for New Zealand for one a week or so later.

After we checked in at the Hotel Australia we hurried over to the office of the Union Steamship Company of New Zealand to accomplish the rearrangement. I anticipated no trouble, as two large passenger ships maintained almost a ferry schedule between Sydney and New Zealand, with sailings about every six days.

The booking clerk had our reservation but when I proposed exchanging it for one a week or so later he shook his head. "I can't promise you anything the rest of the season. The best I could do would be to put you on a waiting list."

I thought about it and suggested, "Perhaps you have a couple who wanted to sail the day you have us booked but had to accept the sailing a week later?"

"Well, yes, probably, but I don't see what we could do about it."

"You wouldn't have to do anything, really. If you can give us a list, or let us copy one, I can get in touch with such people and see if they want to swap."

He shook his head. "We don't do it that way. If you give up your booking, someone else from the waiting list for that day will go in your place. You'll just lose out."

"You wouldn't permit us to exchange with someone sailing on the seventh, let us say?"

"Sorry."

I thought about it. There were always the airlines, of course, but I did not want to suggest to Ticky a 1400-mile flight over the ocean; she would rather have a tooth pulled. I knew now that over-water flights really frightened her.

Oh, well! If nine days was the best we could manage, nine days it would be. I knew I could talk her into flights over land; between airplanes and trains we could see quite a lot of Australia. It would be hard work, but we had managed to see a great deal of Africa on a similar tight schedule, and it did not really matter if we were exhausted by the time we sailed. I answered, "We'll keep the reservation we have. Do you have the ship's plan?"

He got it out. "This is your stateroom."

It was an inside room without a bath and seemed rather small. Ticky said, "Don't you have one with a bath?"

"Oh, no, there aren't any."

"But what are these?" I asked, pointing.

"Eh? Oh, those are *de-luxe* cabins. I couldn't let you have one of *those."*

"Why not?"

"Why, they are booked. Everything is booked. You got the very last reservation."

His last remark was a gambit I have come to recognize. No doubt it is true one time each for each fully-booked voyage, but it is statistically impossible for it to be true as often as one hears it; what it often means is: "Shut up and consider yourself lucky."

So I pressed the matter. "We made the cash deposit for this reservation by mail from the United States to your main office in New Zealand nearly six months ago. Do I understand that all of those outboard cabins with bath were booked that long ago?"

He shrugged. "I really could not say. All I know is that the home office did not release any of them to me."

So I shut up. "All right, we'll take it." I got out a book of traveler's cheques. "How much is the balance?"

"Oh, I can't issue your ticket today."

"Why not? You have the reservation, I have here the receipt for the deposit, and here is the money for the balance."

"But you haven't made out your income tax. Or have you?"

"Income tax? What do you mean?"

He said patiently, "I can't sell you a ticket out of the country until you have filed your income tax return. Obviously."

"Income tax! Why, I'm hardly *in* the country as yet—we got off the ship not two hours ago. How could we possibly have made any money here?"

He shrugged. "That's the law."

I could hear Ticky winding up and getting ready to pitch, so I stepped on her foot. "All right," I agreed. "What do I do and where do I go?"

At least he had the forms. So we went through all the old tired rituals again: age, sex, citizenship, marital status, home address, temporary address, occupation, length of residence, and a dozen other matters even less consequential. It did not take as long as an income tax report back home for the reason that all of the significant entrées were either "no" or "none." At last we handed them in, swore to them, and signed them. "Where do we turn these in?"

"You can give them to me. You said you were staying at the Hotel Australia, didn't you? The Company will leave a message for you there when you have permission to leave the country."

"You mean you still can't sell us a ticket?"

"Not until these papers have been processed, certainly not."

"How long will that take?"

"It shouldn't take long, not over three or four days I should imagine."

"Uh . . . well, thank you. You've been very patient."

"Not at all."

I took a deep breath, dismissed the income tax matter from my mind, and turned to the next matter, an attempt to get passage from New Zealand to the United States. The Union Steamship Company had ships which made this run, but they had refused to book us from the States and had returned our deposit, saying that they could not book that far ahead—but the letter contained a weasel-worded phrasing which, while it accepted our names for a waiting list, implied that it would not do us much good as New Zealanders would probably want the space. I had written back and inquired specifically on this point but the inquiry had been ignored.

So I asked the booking clerk, not very hopefully, about booking passage from New Zealand to the States. He referred us to another clerk, where we were told that no bookings were available. Nor was our name on the waiting list so far as records here showed. I asked them please to let the home office know that we had arrived and were still interested. Would they accept a deposit?

No—but the clerk did promise to write a letter to the home office. Perhaps when we got to New Zealand

We left with a list of shipping companies which had ships to our west coast—or to Canada, Hawaii, or Panama City. We even asked about ships to the west coast of South America, for we were beginning to realize that the situation was desperate, but there were none. It would appear that there is no trade of any sort between South America and Australia plus New Zealand even though they face each other across the Pacific.

It did not take "three or four days" to get our income tax clearance; it took the whole time we were there. In consequence we were never able to get out of Sydney any distance greater than could be driven in one day; our longest drive was about four hundred miles and did not take us past the Great Dividing Range which parallels the east coast, never got out of the coastal, eucalyptus forest geographical region.

Each day we would first telephone the Union line and ask about income tax clearance and our ticket; each day we would be told to call back the following day. Then we would do local sightseeing—except that the first Monday was spent in tramping from one steamship agent to the next, trying to find anything from a raft to submarine which would accept us for passage to any port on the other side of the Pacific. There were none.

Perhaps I should not say "none" for we had one very promising false alarm and once were actually offered passage the long way round via Manila and Hong Kong, then back across the Pacific, in the Cunard Liner *Coronia,* which was making a circum-Pacific cruise originating from London. The agent had to stop to figure out what our fare would be for that portion we wanted. Presently he looked up and said cheerily, "Better sit down first."

"Pretty expensive?" I asked. I had done a rough calculation in my head, based on the number of days we would be in the ship and what I knew of usual first-class fares; I had estimated it at $2000, or perhaps a few dollars over—almost twice what it would cost to fly home, but worth it in view of the way Ticky felt about flying over the ocean. So I was braced for a sizable figure.

"Just over seven thousand dollars," he said.

I blinked. "I don't want to buy the ship, I just want to ride in it."

"Yes, I know. It is a fantastic cost. I wouldn't pay it."

"Nor I. It's way out of my price bracket. What do they give you for that? Dancing girls? Pheasant for breakfast?"

"Well, it *is* a luxury ship. It has a swimming pool and dancing in the evening, all that sort of thing."

The *Ruys* had had a swimming pool and dancing in the evening, and all that sort of thing, but no megalomania about the worth of such. From curiosity I studied the ship's plan. The *Coronia* had a swimming pool not noticeably bigger than the one in the *Ruys* . . . for ten times as many passengers. Her other "luxuries" were on the same meager scale when compared with the ample arrangements of the *Ruys.* She was a floating sucker trap. Seven thousand dollars indeed! "Hmm—" I said. "Would you do something for me? Tell them to take the *Coronia,* fold it until it is all corners, and—"

"Robert!" Ticky said sharply.

Ticky was right. The agent was a nice chap and seemed as shocked by the larcenous attitude as I was. So I thanked him and we left.

The second false alarm concerned a ship whose owners had no delusions of grandeur. She was going to Panama, an acceptable enough destination by then, from where we could fly home or might even manage to catch the good old *Gulf Shipper.* The home office was in New Zealand, and the booking clerk in the Sydney office, a most pleasant lady, could not tell us positively that space was available, but was glad to attempt the booking through the home office.

"Good!" I agreed. "Suppose we wait while you phone them."

"Excuse me? Did you say 'telephone them'?"

"Certainly. There is telephone service between here and New Zealand, is there not?"

"Well . . . yes," she conceded.

"Then let's telephone them at once. I pay for the call, of course—perhaps I didn't make that clear."

"But I couldn't *telephone* them."

"Why not? There's a telephone right there on your desk. Just call them and we will know at once."

The poor woman seemed quite agitated at my insistence. I finally found myself talking to her boss; where she was agitated, he was bland, but he was quite as firm in his refusal to permit a call to be made to the home office. "Airmail will do nicely, my dear chap. We'll get one off at once and we will hear promptly, probably tomorrow."

I explained that it was decidedly worth the cost of a long-distance phone call to me to tie down the reservation at once "It is possible that someone might walk into the New Zealand office later today and book the last available stateroom in that ship. I don't want to chance it; it means too much to me."

He frowned and smiled, seemed perplexed by my stupidity, a little surprised that I would propose anything so obviously improper, even though I was an American. "But we can't, you know. That isn't the way we do business. Sorry."

And there the matter stood. The phone call was not made. We Americans are used to telephoning twice the distance from Sydney to New Zealand, as casually as we call the corner grocery, on any matter of business important enough to warrant the minor expense—or simply to inquire about a relative's health, for that matter. A branch office will phone the home office several times a day; that is how business is done.

But apparently not so in Australia. My willingness to pay the cost had no bearing on the matter; one simply does not telephone the home office. It is not done.

We had still hoped to make a flying trip outback, starting Tuesday, but this delay kept us in Sydney two more days . . . to no avail, as the New Zealand office turned our request down. Then we still hoped to make a trip at least to Melbourne the last two days of the week even though our income tax clearance still had not come through. This time we were stopped not by red tape but by a chance in a thousand: Queen Elizabeth was in Melbourne that day, which meant very simply that a hotel bed was not to be had under any circumstances in Melbourne . . . plus crowds dense as a Mardi Gras, plus choked public transportation.

So we never got out of Sydney. I do not know what would have happened had we entered the country at Fremantle, crossed by train, and arrived in Sydney only a couple of days before our scheduled sailing. Would we have been allowed to catch our ship and leave the country? Or would we have been held there while our null & nothing "income tax" returns were processed? I don't know, but I have no reason to think that Australian red tape will budge for anyone no matter what the predicament. I suspect that it might have been like the telephone call that "couldn't" be made. (And I shall always wonder if we missed being able to reserve passage by that one day's loss of time.)

This income tax nonsense for tourists, indulged in by both Australia and New Zealand, caused me to wonder if our own country indulged in such a useless, timewasting irritation, so I inquired of Internal Revenue on our return. We do not—neither under the old law nor the new (1954). A nonresident alien, tourist or other visitor, who has earned no money in the United States, is not required to make any income tax report of any sort—nothing! Which is as it should be.

Nevertheless we liked Australia on the whole. In seeing Brisbane, Sydney, and the environs of Sydney we did see that part of Australia occupied by more than half of the population, even though we did miss "the salt pans in the middle of Australia" where Yellow Dog

Dingo chased Old Man Kangaroo. We saw two of their three biggest cities and found them no worse than and much like American cities of similar size. The countryside outside those two cities was magnificent; I kept feeling that a landscape architect had been through ahead of us, rearranging it into perfect composition and beauty. In fairness I must admit that the random views around Sydney for a hundred miles or so (as far as we got) are superior to random views in the U.S. countryside save for certain areas overtly touted as tourist beauty spots.

But before we leave the subject of the shortcomings of Australia, let's list the others that came to our attention. The hotel we were in was not very good and Australians readily admit that their hotels are not much. The Hotel Australia is comparable to the Commodore in New York in size and age; it is the best Sydney has to offer, which is hardly true of the Commodore in New York. But the Commodore is a much better hotel in plant and immeasurably better in service and in cuisine. The prices of the Commodore are about half again as much as those of the Australia—which makes the Hotel Australia quite expensive in view of the scale of other prices in Sydney and *very* expensive compared with a similar hotel outside New York.

No need to itemize the shortcomings of the Australia, but here are a few that are typical: we were placed in a room built like a railroad tunnel with a single window at the far end. The only shaving mirror was located the room's length away from the wash basin, which made shaving a source of healthy exercise. The beds—well, never mind the beds; we didn't sleep much anyhow. The cooking was adequate but dull; the menu never changed. Food was available only at set meal hours and a late Sunday morning breakfast in your room was a metropolitan luxury not to be had.

That was Australia's "best" hotel, not bad but not good. The primary cause of the poor hotels in Australia—and the ordinary run of them are conceded to be much worse than the one we were in—is the liquor licensing system; a hotel is primarily a saloon. The profit lies in beer sold over the bar; lodging and meals are supplied only to meet the requirements of the law. The secondary cause lies in union rules; organized labor dominates Australian politics to an extent that American union men would find amazing and union rules of a type undreamed of in most parts of the United States are taken as a matter of course there. In my opinion they have taken advantage of a good thing in a fashion of no real benefit to the union workers and detrimental to all.

For example, I tried to get a glass of water in the restaurant of the Australia and I made the mistake of asking the table waiter for it. But by union rules he is not permitted to pour a glass of water, nor is the bus boy; water being a "drink" must be handled by a liquor waiter or not at all. But a barman was not available at that time. I could see empty glasses and carafes of water not ten feet away, but the table waiter was literally afraid to touch it; the job was not authorized by his union classification.

Groceries may not legally be purchased on a weekend. This makes it tough on working housewives. There are grocery "bootleggers" of course, with their back doors open and with higher prices. I went to one of them with a Sydney housewife; it reminded me of a speakeasy during Prohibition.

Ticky and I, one day when we were sightseeing in Sydney, decided to wait until the business lunch-hour rush was over before eating, for Sydney is a place where more than a million people try to crowd into restaurants sharp at noon. So we waited and so we missed lunch—the restaurants close as soon as the midday rush is over. Union rules again.

This list could go on tediously, so let us consider the examples multiplied by almost any one you can think of and many that, fortunately, have never been thought of in this country. I mean to say, we have proved repeatedly that short hours are not incompatible with high production and good service. The feather-bedders in Australia don't seem to know that. This anti-productive attitude was the very last thing we ran into as we left Australia. Our ship was trying to make the tide and there was just one more sling to be loaded—when it came time for the dockmen to have "smoko," the midafternoon break for a cigarette. Our captain sent down word asking the men to *please* postpone "smoko" for twenty minutes and get that last sling aboard. No go—the rules, rules with the force of law from a government "awards" commission, said to break at that hour. So the ship missed the tide.

Of course, any decent person will prefer the unionism-gone-wild of Australia to the serfdom existing in Russia and South Africa. But there can be a golden mean, fair to everyone—and we are much closer to it than is Australia.

But most Australians seem more than content with their own ways in these matters. I learned from a reporter on one of the Sydney daily papers that a reporter was not permitted to drive his own car nor even a company car while on duty; while out on his news gathering rounds he must be driven by a union chauffeur in a company car. I told him that this struck me as a silly waste of manpower. He informed me quite stiffly that I did not know what I was talking about and that any other rule would be the "—thin entering wedge" which would destroy their rights. The quoted phrase is one that they are fond of and use to justify their most ridiculously nonproductive practices. I suppose that the cited practice could be justified in the fierce traffic of Manhattan, but Sydney is not Manhattan; its traffic is not as dense as it is in any American city of comparable size. Carried to its logical extreme, this so-called principle would require every man who moves around in the course of his day's work to be accompanied by a driver who did nothing else—plumber, real estate agent, milk man, police officer, traveling salesman, building inspector, and so forth. Such a rule would reduce the working force of the United States by several millions without any gain of any sort.

But I have no doubt that this is just what they are trying to achieve in Australia. Remember the waiter who could not pour a glass of water.

This is not the way to increase a country's standard of living.

We made our usual effort to see the slums in Sydney. Sydney's slums are much like our own, neither worse nor better—to the shame of both countries. But I noticed two interesting and depressing variations from our pattern. We saw dwellings, or human lairs, that were entirely underground save for air holes—you could not call them windows—on the downhill side only. We saw also the narrowest row houses imaginable, eight feet wide and five stories tall. It was hard to imagine how a staircase was fitted inside such a building, or why such uneconomic structures would be built in the first place, even as tenements with Scrooge himself as proprietor; the ratio of parasitic structure to rentable space in such a building is all out of proportion.

But on the whole there was not too much to criticize in Australia. Ticky reported to me that ladies' rooms were the worst she had ever seen—not merely primitive but uniformly filthy. I found the men's room much the same sort, but I have seen some bad ones in the United States. Housing in general is old-fashioned and dreary, more of that 1910 feeling. Public transportation in Sydney is almost as bad as it is in Los Angeles. But faults of this caliber can be found in any country; our own beloved country has some dillies.

We never did encounter the intentional rudeness which we had been warned to expect, even warnings from Australians. But we did experience rather frequently a naive, almost childlike way of speaking one's whole mind without thought to how it might sound to the listener, a trait which would have been considered rudeness were it not so ingenuous. For example, our closest friends in Australia informed us that they hoped that, in this coming war, the United States would be bombed rather than England—since it was our "turn." I admit that the wish had a certain bleak logic to it, but it never occurred to them that we, as one of the targets, might not relish the role they had chosen for us.

Another time our host at dinner expressed his admiration for the United States and said that he wished Australia would join up as a forty-ninth state. "Only," he added, "I suppose that if we did, we would have a flood of American tourists and there would be no way to keep them out." He knew, of course, that we were American tourists.

But these remarks were utterly without malice; the speakers would have been shocked and mortified had their unintentional rudeness been pointed out. There were many such remarks, but never a one intended to hurt.

Another custom struck me as naive though not at all rude. In introducing a university graduate to a stranger in Australia it seems to be quite the usual thing to mention the fact that this person is a graduate; the possession of a college degree of any sort seems to be sufficiently unusual to warrant mentioning it, just as we tack "doctor" on the name of anyone possessing a doctor's degree. They do have a rather small number of degree-granting institutions for the size of the population, by our standards, but I have not been able to track down comparative statistics as to college graduates. However, it is evident that the privilege of going to college is more highly regarded by them than it is by us.

American books and magazines are forbidden entrance to Australia, which is commonly the case throughout the Commonwealth. The excuse is dollar exchange, although the printed word is no important fraction of foreign trade. The result is not really harmful to us *as trade* (and I make my living by just such trade), but it is, I think, quite harmful to both countries in that it cuts us off from each other; it is an important and ugly barrier to free communication.

Another result is (since their numbers are not large enough to support writing as a profession to any extent) their magazine stands and bookstores are filled with some of the most amazing trash to be found anywhere. It is as if our stands contained only confession magazines and comic books—no *Harper' s,* no *Time,* no *Saturday Evening Post,* no *Scientific American.*

But let us speak of the good things about Australia, for we did like it a lot. First, the people themselves are remarkably likable, even when blurting out some opinion better left unstated. Second, the culture as a whole is a good one, filled with a generous amount of social justice, founded on human dignity, and honed with a determination to live and fight for freedom. Even the frustrations engendered by silly union practices (and they *are* confoundedly annoying!) derive from good intentions toward the common man.

And finally, the land itself, what we saw of it, is grand and beautiful, worthy of love—and their birds and animals are simply wonderful!

The Sydney Zoo is one of the best in the world. To reach it you cross the harbor in a busy little ferry boat which takes only passengers, no cars. I commented on this, since their proud bridge is relatively new, and was met with stares; it seems that the notion of automobile-carrying ferries is one which never reached Australia. Until the bridge was built it was taken for granted that a car could be used on one side or the other, but not on both. It is, possibly, a weakness in the Australian temperament that they are too prone to take shortcomings and inconveniences for granted. Their far-from-docile spirit is quick to resent the loss of an expected privilege, but annoyances they are used to they seem to regard as natural phenomena like the weather. Perhaps the government knew what it was doing in forbidding American magazines, as it might cause Australian housewives to be unwilling to put up with what they call "kitchens."

From the ferry boat landing a tram runs up to the top of a high hill to the main gate of the zoo; you may then plan your tour downhill all the way, ending up at the ferry landing. The zoo is beautifully gardened and rich in specimens from all over the world, but our interest was in the Australian fauna not often seen elsewhere. There were lots of koalas but they could not be touched nor even seen from close up, which made us glad indeed that we had visited Lone Pine Sanctuary. We had the good luck to see a platypus. They are not easily seen even at the zoo, as they spend most of the daylight hours in their burrows. But we saw one come out and forage on the bottom of its tank for worms.

A platypus in the flesh is even more unbelievable than one pictured in a book; he looks as if he had been assembled by a taxidermist with a warped sense of humor. Duckbilled, egg laying, fur bearing, and it suckles its young—it seems to have been created for the express purpose of giving nervous breakdowns to taxonomists.

The platypussy does not seem to have good eyesight nor a keen sense of smell. The bottom of the tank was liberally carpeted with worms but the duckbill had a terrible time finding them. He went blundering along, missing nine by millimeters and gobbling greedily the tenth, while Ticky frantically coached him from the sidelines. The coaching had no effect, but she does not speak fluent Platypussian at best.

Australian birds are as freewheeling as Australian animals. The emu, cassowary, and black swan, the bower bird, budgie, and kookaburra or "laughing jackass"—all of these are exotic enough for anyone. The whole continent has been a bird sanctuary, cut off from the rest of the planet and lacking natural enemies, for many eons—during which the feathered kingdom ran wild. Ticky and I loved them all but our favorites were the birds of paradise. Describing a bird of paradise is ordinarily about as useful as parsing a poem; the color plates of them in any good encyclopedia are much more rewarding. But I want to mention one fellow.

We had been easing slowly past their cages, admiring their kaleidoscope patterns and colors, struck almost breathless by their flamboyant beauty, and reading the names of each—the Great Bird of Paradise, Crown Prince Rudolph's Bird of Paradise, the King of Saxony's Bird of Paradise. Then we came to a cage labeled simply: "The Magnificent Bird of Paradise."

There was a little fellow in there no bigger than a robin, not brightly colored and not conspicuously plumed; we felt that there had been some mistake—no doubt he was just being kept in there temporarily and they had not bothered to change the sign, for he certainly was not "Magnificent" and it seemed unlikely that he was a bird of paradise at all.

Then he caught sight of us, chirped excitedly, and hurried up to the front of the cage. There was a little perch there, about a foot in front of our noses; he settled on it, shook himself, and started to run through his act.

He was magnificent. It had been precisely the right word for him. He was the most applause-hungry ham I have ever seen and his routine had everything but "Shuffle Off to Buffalo." First he threw his neck feathers up into a ruff which framed his head. He paused for us to admire him, then dropped it and puffed out all his feathers until he was four times normal size. He deflated and opened a zipper all the way down his belly. That is what it looked like—a zipper. The feathers moved aside in a straight line about a quarter of an inch wide and disclosed bright iridescent down underneath.

He waited for the laugh with true Barrymore timing, then closed the zipper and opened his mouth. All the inside of his mouth was bright Paris green.

He closed it, braced himself, and gave the climax of his act: he sang for us.

It was unbelievably, hysterically bad. I can perch on a stick and sing better than that, and I have been chucked out of some very inferior quartets. But he was as cockily sure of himself as Mario Lanza. So we clapped and screamed bravos.

He looked smug, took a bow and an encore, running through the whole routine again without variation. We applauded again and were about to move on reluctantly, when we learned that he had a special encore with which to wow 'em. He hopped into the air, turned a hundred and eighty degrees and landed with his back to us—whereupon he ran through exactly the same routine, including the rusty-iron song, with his back to the audience. This time we discovered that the lining of his ruff was bright yellow. I think he did not want us to miss it.

He ran through his act twice with his back to us, finishing with that awful song, then flew away; the show was over and we could not entice him back. We crept away from there quietly, realizing that we had been in the presence of genius.

The aquarium at the Sydney Zoo is one of the best and may possibly be the best in the world. In addition to all the usual small exhibits and many not usual it has sharks up to eight feet long in a pool large enough to hold them comfortably. In another immense pool they have a giant ray about fifteen feet square. They grow much larger than that, but this specimen is quite large enough to inspire terror and disgust. The aquarium has many octopi and we saw two large ones fighting. No, I really do mean fighting; in this breed lovemaking cannot be mistaken for fighting—the means by which octopi get little octopussies is even more preposterous than what fish do. Look it up sometime; you will be amazed.

That zoo merits at least a week of careful study, but we had to hurry to catch the last ferry.

We prowled downtown Sydney by ourselves, were driven all around Greater Sydney by Vol and Laura Molesworth, and were driven for hundreds of miles through the surrounding countryside by Brian Foley. Vol teaches at the University of Sydney; Brian is a partner in a literary agency. This was typical of the hospitality we enjoyed there. Although we knew no one in Australia when we left home, nevertheless I do not recall that we ever ate dinner alone in Sydney, except on the day of our arrival. Australians are not cold and standoffish.

The trips around town included ones to Botany Bay, symbol in song and story of the convict system. It is a wide, shallow unattractive bay which never was the site of a convict settlement; it was the destination of the 1788 First Fleet but the actual settlement was made six miles to the north in what is now Sydney. Botany Bay is now a place of yacht basins, boat yards, light industry, secondhand car lots, and suburban homes.

The trips out into the country were an endless succession of prize vistas and musical aborigine place names, names like Yerranderie, Burragorang, Wollondilly, Woronora, Wollongong. North and south from Sydney are endless haughty cliffs and fine beaches; inland are hills and low mountains and canyons. We saw the famed tree ferns, living fossils of the carboniferous era.

Despite the not-inconsiderable inconveniences, when the time came we were reluctant to leave. But Australia had one more magnificent piece of red tape to speed the parting guest. Attached to our ticket, when at last they deigned to issue it, was a notice that we must apply for an export license from the Commonwealth Bank of Australia (equivalent to our Federal Reserve Bank) for any monies we wished to take out, whether in cash or in traveler's cheques. I had been aware of the limits placed on cash and had planned our spending accordingly, but the second category was so worded as to include American traveler's cheques.

Ticky suggested hiding our American Express cheques and ignoring the business. The notion suited me but I doubted the practicality of it; the officers at the docks would know that we must have funds of some sort; if we failed to show an export license, we would simply be in trouble. So I set about getting one.

It did not seem to be too difficult, since there was a branch of the Commonwealth Bank right in the hotel. I went there. They examined my papers with interest, talked it over, and decided that there was nothing they could do for me. They suggested that I go to the main office of the bank.

The breaks were with me; it was less than half an hour away. I went there, queued up at the foreign-exchange window, eventually was referred by the teller to one of the officers of the bank. He considered my problem and told me that I did not want to be in the bank proper at all, but should go to the eighth floor to the controller of trade & export licenses. To get there I should leave the bank, go around the corner, enter the office-building entrance, and find the lifts. I whistled to my dog team and mushed on; I was beginning to find the search fascinating.

The office I was sent to was not quite the right one, but it was close; the side activity which actually dealt with such matters turned out to be on the same floor. By now the morning had passed (and our three o'clock sailing was coming apace); the man I wanted to see was out to lunch. No one else was permitted to stamp the form, naturally; these things have to be done properly.

But the wait was hardly thirty minutes and the official was quite helpful when he did return. By now we had only some forty-seven checks left and it did not take very long to inventory them, list them by denomination and number, and fill out the rest of the blanks; in another half hour it was all done. The bank official was a bit dubious about the fact that some of the cheques were made out in my name and some of them in Ticky's name, but, since she was not present and our ship was sailing very shortly, he stretched a point and made out a license which mentioned both our names and issued it to me, granting me permission to remove from the sovereign Commonwealth of Australia bits of paper showing that I had paid dollars to the American Express Company back in Colorado, U.S.A.

I hurried back to the Hotel Australia where Ticky was waiting in the lobby. She had been sitting there, watching our baggage and wondering what had happened to me, since we had had to vacate our room earlier in the day—in general, hotels in the Commonwealth do not follow the gracious custom of extending the courtesy, on request, of a later check-out to a guest who is not leaving town until after the regular check-out time, so she had stayed with our baggage in the belief that I would return in ten minutes or so.

All it cost us was our lunch.

XII

The Dreary Utopia

OUR STATEROOM IN the New Zealand steamship *Monowar* turned out to be even smaller than I suspected from the berthing diagram; if one of us inhaled it was a good idea for the other one to exhale. There was a single straight chair which had to be moved in front of the door to permit us to get at the wash basin, then moved back in front of the wash basin to permit us to go out the door.

I went at once to the purser's office, having in mind that a shipping company will often hold a V.I.P. room right up until sailing and sail with it empty, provided no politician, lord of industry, or relative of the chairman of the board needs it. I planned to offer the purser a sackful of Yankee dollars and ask him to shift us to the V.I.P. room, if any.

Either New Zealand lines do not follow this practice or the V.I.P. had claimed the room earlier; the purser assured me that there was no unoccupied stateroom of any sort in the ship. I was inclined to believe him, as the ship was as crowded as a department-store elevator on Dollar Day. Besides that, although the ship was in all respects luxurious in its fitting, and furniture, everything about it was a little bit skimpy, like a wartime suit. The passageways were not quite wide enough for two people; when you encountered anyone it was necessary for one of you to stop and flatten against the bulkhead to avoid collision. I felt, the whole time we were in her, as if I were taking a shower in a stall too small to permit me to raise my elbows.

I went back and told Ticky the situation. She had been trying to sort out what we needed and what we could do without from the ten suitcases, and she was hot and tired and dirty. She looked up, wiped dust across her face, and made a suggestion both unladylike and impossible. I reproved her. "Besides, you don't even know the purser."

"I don't want to. Knowing his ship is enough."

"He's really a very nice man. It isn't his fault. Come to think of it, it's your fault. If you weren't old-fashioned and a pantywaist besides, we'd be half way to New Zealand this minute, by air, and we'd be sleeping in a nice, big hotel room tonight, with a big bed and a big bathtub." She did not answer so I added, "Come on now, 'fess up. We're here because you wanted it this way."

Ticky took refuge in the Nineteenth Amendment.

I said, "You don't mean the Nineteenth, you mean the Fifth."

"I know which one I mean! The Fifth is the one the communists are always hiding behind. I'm not going to hang around with *them*—so I use the Nineteenth."

I looked it up later. She really did mean the Nineteenth.

We had signed up for second table but shortly before dinner the chief steward came around to our little smokehouse. Captain's compliments and would we join him at his table?

We looked at each other, astounded. I managed to say, "Tell him 'yes,' " and the steward left. Ticky said slowly, "I don't really want to sit at the Captain's table."

"I know, and neither do I. But what else could I say? You can't refuse such an invitation, you simply can't. Not from a master in his own ship."

"Oh, you did just exactly right. But I don't have to like it."

"No, you don't have to like it. But you do have to be polite, or I'll keelhaul you myself."

"You and eight sturdy seamen, maybe. Want to swap a little judo?" I refused with dignity. Ticky knows some awfully dirty holds.

To our surprise, we enjoyed sitting at the Captain's table. Captain F. W. Young was both a taut shipmaster and a cultured, charming man of the world. The shortcomings of the *Monowai* were either inherent in her design or derived from company policy ashore; he himself ran a clean, disciplined ship. His other guests at his table were most pleasant people, too—Mr. and Mrs. Adman from Sydney, Mr. Field from Victoria. But we never did find out on what basis he had selected us. Ticky and I finally concluded that it was possible that we had been tapped simply because we were the only Americans aboard, which still left open the question of whether we were picked as curiosities or whether our country was being honored through us. We never asked—I suppose we were a little afraid that we might find out.

As we became better acquainted with our table mates it was natural that they should see our stateroom and we should see theirs. Mr. Field had a large cabin outboard of ours, with portholes, a private bath and plenty of deck space; the Admans had an equally nice one forward, with a semi-private bath, shared with one other couple. We showed the dark, cramped Iron Maiden we lived in and told them our story. Had it been necessary for them to make reservations months ahead to get the accommodations they had?

Not at all—in one case the reservation had been made two weeks ago, in the other case a little longer.

I thought of our cash deposit made the previous year and I began to burn. At the earliest opportunity I braced the Captain himself about it, telling my story and then saying bluntly that I thought that the company had a fixed policy under which Americans were not given even treatment with Australians and New Zealanders.

He smiled, did not comment, and changed the subject at once. I am not sure whether he knew of such a policy and did not care to admit it publicly, or whether he simply considered my remarks silly and wished to avoid unpleasantness. It is even possible that he was unaware of the truth either way; after all, captains do not sell tickets.

But I remain convinced that Americans are discriminated against by this line. We had clear proof that they could have given us decent and comfortable accommodations at the time we put up our deposit, and I strongly suspect that they could have booked us out of New Zealand in one of their ships running to the United States if they had honestly followed the policy of first-come-first-served.

New Zealand maintains travel commissioners in major American cities to try to persuade us to come to New Zealand and spend those dollars. Hmm ...

The four-day passage to New Zealand was without incident; it was merely uncomfortable. The Captain invited us up to the bridge to see the landfall and passage in through the heads into Auckland Harbor, but we could not see much as the weather was dirtying up rapidly; we were scooting in just ahead of a cyclone—a cyclone in these latitudes is the same as a hurricane; it is not the local twister of the Kansas plains. I was surprised to discover that the harbor was on the east coast of North Island, as a small-scale map makes it appear to be on the west coast.

"It's not surprising," Captain Young told me. "All the world's best harbors face east."

"So? How about San Francisco Bay? Or San Diego?"

"You've named two. But take a look at your own east coast. Take a look at the map of the whole world. For every fairly good harbor on a west coast there are half a dozen excellent ones on the east."

I thought it over and decided that he was largely correct, but I certainly had never realized it until he pointed it out. Entrance into New Zealand required more paperwork than did any other country, plus an unusually tedious process at customs. I had another minor crisis with Ticky, for New Zealand had thought up a brand-new piece of nonsense: every visitor must sign a statement and swear a formal oath before an immigration officer not to do anything harmful to the

Queen. They handed these forms out the morning we arrived; Ticky read hers and blew her top. "I am not going to swear allegiance to their blankety-blank queen!"

"Now quiet down, honey. It doesn't say anything of the sort."

"It does so. And I won't sign it!"

"No, it does not. All you are promising to do is to obey laws of New Zealand while you are in their country. I know you won't, but I'm hoping that you will be discreet enough not to get caught. So why not sign it?"

"It doesn't say anything about their laws; it's an oath that I will uphold their queen. I won't."

I tried again to explain it in a way she would accept very wearily, for I considered it as nonsensical as she did. A criminal or a foreign spy would take such an oath and not turn a hair, while an honest man surely did not need to take it. "See here, baby, it's just a peculiarity in semantics. When they frank an envelope they put on it: 'In Her Majesty's Service,' while we put on it: 'Penalty for Private Use to Avoid Payment of Postage $300'—and they both mean precisely the same thing: 'Official Business, Free.' All this means is that you promise not to break the Queen's laws, which right here means the laws of New Zealand. You obeyed Peron's laws while you were there, but that didn't mean that you approved of Peron."

"All right, I'll sign a statement that I won't break any of their silly laws—but I won't sign that thing!"

I gave up, which is often the only way to win with Ticky; lack of opposition makes her unsure, I think. "Have it your own way. If you won't sign, they won't let us off the ship. We will have to stay right where we are for three days in port and then four more days at sea, then we are back in Australia. I suppose the police there will want to know why we were deported from New Zealand, but at least our visa is still valid. We can start tramping the streets of Sydney again, trying to book some sort of passage back home."

With that I dropped the matter. When the time came she signed the form, put up her right hand when she was told to, and muttered something. I did not hear what she said and I am sure the immigration officer could not hear it either. Perhaps it is just as well.

But will somebody tell me, please, why it is that countries will advertise for tourists, then do their very damndest to make the tourist feel like a child being kept in after school?

Once we were through customs we piled our bags into a taxi and asked the driver to take us to the Waverly Hotel, where a room had been reserved for us by the Union Steamship Company. The ride turned out to be only a few hundred yards, as the docks in Auckland rub elbows with the main downtown business districts, instead of being weary miles away as is so often the case. But during that short ride I looked around more eagerly than ever before, for New Zealand, of all countries in the world other than my own, interested me the most.
